bread cordially concurred; and in the year 1805, he distinguished himself as the public accuser of Mr. Dundas, (created lord Melville) for malversations that had occurred, whilst he had occupied the post of treasurer of the navy. His charges against this nobleman were founded on a report of the commissioners of public accounts, from which it appeared that, during the exercise of his office, this noble lord had violated the law, by conniving at mal-practices and participating in unwarrantable emoluments; and that he was responsible for deficiencies amounting to 697,500*l*. These charges also implicated Messrs. Trotter, Wilson, and Sprott; and the former in particular, who was paymaster of the navy department under lord Melville, and had taken out large sums of money on his own private account. In the investigation of this business, it was discovered, that the sums officially deposited in the Bank had been withdrawn, lodged with private bankers, and applied to other purposes besides those that were properly naval. Mr. Whitbread founded on several facts which he stated, a variety of resolutions which impeached the fidelity and honour of his lordship. To his motion relative to this business, Mr. Pitt moved an amendment, which was negatived by a majority of one (217 to 216), in consequence of the vote of the speaker. In consequence of these proceedings, the viscount resigned his office at the Admiralty-Board, and his name was expunged from the list of privy-counsellors. Upon the sudden demise of the premier, and a coalition between lord Grenville and Mr. Fox, the two latter came into office; and Mr. Erskine, being raised to the peerage, and appointed lord high chancellor, was destined to preside at lord Melville's trial. This nobleman having made his defence within the bar of the house of commons, was replied to by the member for Bedford; and an impeachment being agreed upon, proceedings commenced in Westminster-hall, April 29th, 1806. The result, after a short trial, was the acquittal of his lordship by a majority, from all the charges alleged against him. Notwithstanding the unexpected termination of this trial, neither the friends nor the enemies of the supposed delinquent attached any blame to the public accuser; but he was allowed to have conducted the business assigned to him with a dignity and propriety suitable to its delicacy and importance. In the case of lord Melville, as well as in that of Mr. Pitt, he knew how to distinguish between the man and the minister; and to pay a just tribute to the talents and dispositions of the former, whilst he criminated and condemned the latter. Having differed with Mr. Pitt, with regard to his political measures almost through the whole of his public life, he took the opportunity which the trial of lord Melville afforded him of paying a just tribute of respect to his abilities and virtues, when his premature death must have vindicated the eulogist from the slightest suspicion of insincerity and adulation.

Of the new administration, he was a steady supporter; but though he had at an early period enlisted himself under the banners of Mr. Fox, and the earl Grey, his school-associate and brother-in-law, who was one of its distinguished members, he was their friend as ministers, not from personal and selfish motives, but from a conviction of his judgment that their principles and views were most favourable to the liberty and welfare of the British empire. Indeed he was regarded by many as an impracticable man, because in all great questions he was influenced by principle more than by any private and party attachment. What were his sentiments of the coalition ministry, and what were the grounds of the support which he afforded them, he had an opportunity of stating in the most explicit manner. At this time sir Francis Burdett offered himself a candidate for the county of Middlesex, and transmitted a circular letter to Mr. W., who had voted for him twice before, soliciting his support. This letter contained reflections on the coalition ministry, which led the subject of this article to decline giving his vote for sir Francis, and also to express his sentiments of the coalescing parties, which had been severely censured. "I have supported the present administration," says Mr. W., "from a conviction

Vol. XXIV. No. 1662.

that they were united upon principles of real public utility, and for the purpose of carrying into execution plans of great national improvement, both in our foreign and domestic circumstances; and I cannot abandon them, because in a situation more difficult than that in which any of their predecessors have ever stood, they have not been able to effect what I believe to have been nearest the hearts of them all—I mean a peace with France; seeing such a peace could not have been obtained on terms consistent with national honour, and because time has not sufficed to mature and execute the schemes of internal improvement, which they have manifested their determination to pursue," &c. Having stated some other opinions with regard to the union of parties, in which he seems to have disagreed with sir Francis, he concludes: "These radical differences render it impossible for me to assist you in becoming a member of parliament. Different opinions may be maintained consistently with mutual and entire personal respect; such as I unfeignedly profess towards you. The determination you have taken to avoid the expense of conveyance and decorations so conspicuous at your former elections, does you honour; and I wish such an example could be followed by all other candidates," &c. The publication of this correspondence threatened a very undesirable termination; but it was happily prevented by the interposition of friends.

During this period, Mr. Whitbread took an active part in public affairs, and distinguished himself on a variety of occasions, guarding on the one hand with vigilant jealousy against an undue exertion of the royal prerogative, and on the other against its infringement by the democratical part of the constitution. In February, 1807, he renewed his attention to the existing system of poor laws, as it was his wish and incessant endeavour to improve it, and in so doing to render the peasantry happier, better, and less dependent. It was also an object, which he conceived to be of essential importance, to controul the several branches of public expenditure, and thus to relieve the distresses of the country. Much depended, he well knew, on peace with France, and to this desideratum his views and efforts were constantly directed. But he was almost ready to despair of this desirable event "from the awful moment that death closed the scene upon the enlightened statesman (Mr. Fox) who had first commenced the negotiation." When the Grenville administration was obliged to retire, and a new parliament was convoked by their successors, he published a spirited address to his constituents, in which he stated the measures which had been projected and wholly completed or commenced during the existence of the late ministry, and the part which he had taken in the deliberations of the preceding parliament, closing with these memorable words: "I court your inquiry, and if you are satisfied in the result of it, I hope for your votes in the present election. If you do me the honour again to return me, I shall indeed be proud of it, and I will again endeavour to do my duty." The next important object of his attention was the education of the poor, as intimately connected with their morals and religion; but unable to obtain a legislative sanction to his plan, he was under a necessity of recurring to individual exertions and private subscription. During the important debates that occurred in 1809, with regard to the orders in council, he concurred with those who condemned this measure, and contributed first to their suspension, and at length to their utter discontinuance. With regard to the situation of Spain, he was one of those who censured the conduct of the French government, and who wished the natives to be stimulated to new exertions in behalf of the independence of their native country. "In 1809," says one of his biographers, "he took an active part in the inquiry and examination into the conduct of the royal duke who presided over the army, and although he found much to blame on that occasion, yet, at a future season, he seized the first opportunity to afford his testimony in behalf of his royal highness, whose administration as commander-in-chief had contributed not a little to the happy and glorious termination of the late contest.

6 X

That

That event did not prevent him, however, after the overthrow of Buonaparte's government, from blaming the conduct of the Congress, and exposing the ambitious views of some of the sovereigns, particularly in respect to Saxony. On the return of the emperor from his exile in the island of Elba, the member for Bedford strongly and emphatically censured the declaration of the allies, more especially that part of it which seemed to recommend the detestable principle of assassination. He also loudly insisted both on the impolicy and injustice of a new war, on the ground that the executive power of the enemy was not vested in the hands of any one particular person. But above all things he protested against the forcible restoration of the Bourbons by a foreign force, and the assumed right of dictating a government to France. Yet he most cordially joined in a vote of national gratitude to the duke of Wellington, for the memorable victory at Waterloo, although he at the same time boldly avowed that events had not altered his sentiments in respect to the pretended justice of the original contest."

In the variety of his personal and domestic concerns, in his attendance on parliamentary duties, and in his efforts for establishing and promoting institutions of public utility, and more especially such as pertained to the instruction of the poor, Mr. Whitbread was assiduous and indefatigable; and whilst he was overwhelmed by a multiplicity of occupations, he voluntarily undertook a more Herculean labour than any other, which was the arrangement of the perplexed concerns of Drury-lane theatre. With every moment of his time thus occupied, and his mental powers unremittingly exerted, it is no wonder that his health should decline, and that his mind itself, though naturally vigorous and ardent, should be impaired by excess and intenseness of application. The consequence that might have been apprehended, unhappily occurred on Thursday, July 6, 1815. He destroyed himself with a razor.

WHITBURN, a parish of England, county of Durham; 3 miles north-by-west of Sunderland.

WHITBY, a seaport and market town of England, in the North Riding of Yorkshire. It stands on two opposite declivities, one facing the east, and the other the west, on the banks of the river Esk, which forms the harbour, and divides the town into two nearly equal parts, connected by a draw-bridge, so constructed as to admit ships of 500 tons burden to pass. It is very closely and irregularly built: but the houses of the opulent inhabitants are spacious and elegant. Here are few public buildings that are worthy of notice. Among these are two public schools, one for boys and another for girls, conducted on the British plan. A large and handsome building for both schools, calculated to accommodate 500 children, has recently been erected by subscription. The parochial church is seated near the verge of the cliff, on the eastern side of the town, a little to the north-west of the abbey, and is approached from the town by an ascent of 190 stone steps, which renders it of difficult access to the old and infirm. The architecture of this church was originally Gothic; but it has undergone many modern alterations, and now retains little of its ancient form.

Whitby is an ancient town, and owes its origin to a famous abbey, founded here in the 7th century, by Oswy, king of Northumberland. It was afterwards burnt by the Danes, but was rebuilt with great splendour after the conquest, and continued till the general dissolution of those establishments. Of this abbey, nothing now remains but the ruins of the church, which was formerly 100 yards in length, and 24 in breadth, exclusive of the transepts, which extended 12 yards further on each side. This venerable ruin stands in a commanding situation, on a high cliff, on the east side of the town, which it overlooks. About the beginning of the commonwealth, the population amounted to nearly 2000; and the whole marine belonging to the port was about 20 small vessels, manned with 120 or 130 seamen, and all employed in the coasting trade. At the restoration of Charles II. in 1660, the number of inhabitants was increased to nearly 3000, and that of the ships to about 30; an increase which may be ascribed to the alum-works at Saltwick. In

the year 1690, the number of inhabitants in Whitby was nearly 4000; and 60 ships of 80 tons burden belonged to the port. It was now resolved to improve the harbour, which was greatly exposed to the violence of the waves; and in pursuance of two acts of parliament, obtained, one in 1702, and the other in 1723, the east pier was built, extending from the eastern cliff above 200 yards westerly, to the channel of the river Esk. This was a great security to the port, as it restrained the violence of the sea in north-easterly storms. Whitby carries on at present a great trade in coals; it also exports various articles of provision, tallow, &c.; and the alum-works in the neighbourhood employ a great number of hands. The immense mountains of alum rock, and the interior works, with all the apparatus for preparing alum, are well worthy of observation. This town has suffered much from the ocean, particularly in 1787, when a strong new built quay, supporting a pile of buildings 80 feet above the level of the sea, was destroyed, and the venerable old church, belonging to its ancient convent, standing on a cliff about 30 yards distant, was near sharing the same fate. On the east side of the mouth of the harbour are cliffs nearly perpendicular, some of them 180 feet above the level of the sea. The shore on that side consists of a smooth flat rock, resembling slate, called by the inhabitants the *Scarr*. It is overspread in some places with large loose stones. The neighbourhood of Whitby abounds with natural curiosities; and the various petrifications almost everywhere found in the alum rocks, have long excited wonder, and puzzled philosophy. Here are found an incredible variety of petrified shells, with pieces of wood, bones of fishes, &c. Several highly interesting specimens of the large marine animal called *proteosaurus*, or *ichthyosaurus*, have recently been discovered in the aluminous schist, or alum rock. The population taken in 1821, amounts to 10,275; 48 miles north-north-east of York, and 247 north-by-west of London.

WHITBY, a village of England, in Cheshire, near Chester.

WHITCHESTER, a township of England, in Northumberland; 9 miles west-north-west of Newcastle-upon-Tyne.

WHITCHURCH, a borough and market town of England, in Shropshire, is seated on an eminence, at the top of which stands the church, commanding an extensive view of the distant country. It is a handsome modern building, of the Tuscan order, erected by act of parliament in 1722, on the site of an old structure. The whole is built of freestone; and at the west end is a square tower, 108 feet in height, surmounted by battlements. The inside of the church is handsomely fitted up, and contains a fine altar-piece, and two ancient effigies, removed from the old church. One of these represents John Talbot, the first earl of Shrewsbury, who was called the English Achilles, and is described by Shakspeare, in his play of Henry VI., as a formidable and terrific character. Here is an excellent free school, with houses for the master and usher. Market on Friday. Fairs on Whit-Monday, and on the 28th October; 20 miles north of Shrewsbury, and 161 north-west of London. Population 5332.

WHITCHURCH, a market town and borough of England, in the county of Southampton. It is pleasantly situated on a small stream, famous, and much resorted to, for trout fishing. The town consists chiefly of one street, which of late has been much enlarged and improved. It sends two members to parliament, chosen by the freeholders of lands and tenements. The number of voters is about 70. Market on Friday, chiefly done by samples; and four annual fairs; 24 miles north-east of Salisbury, and 58 west-by-south of London. Population 818.

WHITCHURCH, a parish of England, in Buckinghamshire; 4½ miles north-by-west of Aylesbury. Population 714.—2. A parish in Devonshire; 1 mile south-east of Tavistock. Population 595.—3. A parish in Herefordshire; 6½ miles south-west of Ross. Population 745.—4. A parish in Oxfordshire; 6½ miles west of Reading, Berkshire. Population 540.—5. A hamlet in the parish of Henstridge, Somersetshire.—6. A parish in Warwickshire; 4½ miles south-south-east of Stratford-upon-Avon.—7. A township

of Wales, in Glamorganshire; 3 miles from Cardiff. Population 397.

WHITCHURCH, WINTERBORNE, a parish of England, in Dorsetshire; 5½ miles south-west of Blandford Forum. Population 378.

WHITCLIFFE, a hamlet of England, in the parish of Rippon, West Riding of Yorkshire.

WHITCOMBE, a parish of England, in Dorsetshire; 3 miles south east of Dorchester.—2. A parish in Gloucestershire; 5 miles from Gloucester.

WHITE, *adj.* [hpiz, Saxon; *wit*, Dutch; *hweits*, M. Goth. consent. linguis cognatis. *Serenius*.] Having such an appearance as arises from the mixture of all colours; snowy.—Why round our coaches crowd the *white-glov'd* beaus? *Pope*.—Having the colour of fear; pale.

—My hands are of your colour, but I shame
To wear a heart so *white*.

Shakspeare.

Having the colour appropriated to happiness and innocence.

Welcome, pure-ey'd faith, *white*-handed hope:
Thou hovering angel girl with golden wings,
And thou unblemish'd form of chastity.

Milton.

Grey with age.

I call you servile ministers,
That have with two pernicious daughters join'd,
Your high-engender'd battles 'gainst a head
So old and *white* as this.

Shakspeare.

Pure; unblemished; unclouded.

Unhappy Dryden! in all Charles's days,
Roscommon only boasts unspotted lays:
And in our own, excuse some courtly stains,
No *whiter* page than Addison's remains.

Pope.

WHITE, *s.* Whiteness; any thing white; white colour.

My Nan shall be the queen of all the fairies,
Finely attired in a robe of *white*.

Shakspeare.

The mark at which an arrow is shot, which used to be painted white.—If a mark be set up for an archer at a great distance, let him aim as exactly as he can, the least wind shall take his arrow, and divert it from the *white*.

The albugineous part of eggs.

I'll fetch some flax and *whites* of eggs
T' apply to's bleeding face.

Shakspeare.

The white part of the eye.

Our general himself
Sanctifies himself with's hands,
And turns up the *white* o'th' eye to his discourse.

Shakspeare.

To **WHITE**, *v. a.* To make white; to dealbate; to whitewash.

Thou—dost never

Wear thy own face, but putt'st on his, and gather'st
Baits for his ears; liv'st wholly at his beck;—
Whit'st over all his vices.

Beaum. and Fl.

WHITE, a parish of England, in Wiltshire; 8 miles from Salisbury. Population 872.

WHITE, a county of the United States, in West Tennessee. Population 4028, besides 283 slaves.—2. A county of the United States, in Illinois, of which the chief town is Carmi.

WHITE, CAPE, or **CAPE BLANCO**, a cape of North America, on the east coast of Nicaragua; 60 miles south of Cape Gracias a Dios. Lat. 13. 15. N. long. 83. 4. W.

WHITE, POINT, a cape on the coast of Cape Breton, near Louisburg.

WHITE, POINT, a cape on the south coast of Jamaica; 20 miles east of Port Royal.

WHITE, POINT, a cape on the north coast of the island of Cumbava. Lat. 8. 15. S. long. 118. 51. E.

WHITE, POINT, a cape on the coast of Newfoundland; 9 miles south-west of Canso.

WHITEBALL, a hamlet of England, in the parish of Samford Arundel, Somersetshire.

WHITE BAY, a bay on the east coast of Newfoundland. Lat. 50. 10. N. long. 56. 25. W.

WHITE BAY, a bay on the east coast of Kerguelen's Land, south of Point Pringle, so called from some white spots of land or rocks. In the bottom are several smaller bays or coves. Lat. 47. 53. S. long. 69. 15. E.

WHITE'S BAY, a bay on the coast of Newfoundland. Lat. 50. 17. N. long. 56. 15. W.

WHITE BEAR LAKE, a lake of North America, out of which proceed some of the head waters of the Mississippi. Lat. 46. 50. N. long. 95. 30. W.

WHITE BLUFF, a settlement of the United States, in Chatham county, Georgia; 10 miles south of Savannah.

WHITEBURN, a parish of Scotland, in West Lothian, in the south-west corner of the county. It extends about 6 miles in length, and between 2 and 3 in breadth. Population 1693.

WHITEBURN, a considerable village of Scotland, in the above parish; 21 miles west of Edinburgh, and 23 east of Glasgow, on the road from Edinburgh to Hamilton and Glasgow, by Kirk of Shotts.

WHITE CAVE, a cave of the United States, in Kentucky, a mile from Mammoth Cave.

WHITE CHAPEL, a parish of England, in Middlesex, being one of the out parishes of the city of London, on the Essex road. Population 27,578.—2. A hamlet in Lancashire; 5½ miles from Parstang.

WHITE CHIMNIES, a post village of the United States, in Caroline county, Virginia.

WHITE CHURCH CANONICORUM, a parish of England, in Dorsetshire; 5 miles west-north-west of Bridport. Population 1065.

WHITE CLAY, a hundred of the United States, in Newcastle county, Delaware, south of White Clay Creek. Population 1701.

WHITE CREEK, a township of the United States, in Washington county, New York, lately formed out of the east part of Cambridge; 36 miles north-east of Albany. Here is an academy.

WHITE'S CREEK, a post village of the United States, in Rhea county, Tennessee.

WHITE DEER, a post village of the United States, in Lycoming county, Pennsylvania.—2. A township of the United States, in Northumberland county, Pennsylvania, on the Susquehannah. Population 1132.

WHITE-EARTH RIVER, a river which empties itself into the Missouri from the north. This river, before it reaches the low grounds near the Missouri, is a fine bold stream, 60 yards wide, and is deep and navigable; but it is so much choaked up at the entrance, by the mud of the Missouri, that its mouth is no more than 20 yards wide. It has steep banks, about 10 or 12 feet high, and the water is much clearer than that of the Missouri. The salts also, which have been mentioned as common on the Missouri, are here so abundant, that in many places the ground appears perfectly white. It is navigable almost to its source, which, from its size and course, is supposed nearly to extend to the 50th degree of north latitude.

WHITEFACE, a mountain of the United States, in New Hampshire.—2. A mountain in Jay, New York. It commands a very extensive prospect. Montreal, 80 miles distant, may be seen from its summit. Its height is estimated at 2600 feet.

WHITEFIELD, a township of the United States, in Coos county, New Hampshire. Population 51.

WHITEFIELD, or **BALLTOWN**, a post township of the United States, in Lincoln county, Maine; 220 miles north-north-east of Boston. Population 995.

WHITEFIELD (George), one of the founders of Methodism (see **METHODISTS**), was the son of an innkeeper at Gloucester, where he was born in 1714, and where he received the rudiments of literature, so as to be sufficiently qualified for his father's business, for which he was designed. Accordingly he commenced it as drawer at the Bell-inn. At school he is said to have been distinguished by a retentive
memory

memory and good elocution. Of his early years, he gives a very unfavourable account, so that there was nothing about him but a fitness to be damned, with occasional gleams of grace that afforded some indication of his future destination. About the age of 18, he was admitted a servitor at Pembroke college, Oxford, and associated with those young persons whose dispositions and habits resembled his own, and whose conversation and manners contributed to cherish that religious enthusiasm to which he was strongly addicted. As soon as Dr. Benson, bishop of Gloucester, received information concerning the state of his mind and the course of his general conduct, he made him an offer of ordination, when he was about 21 years of age, and he was accordingly ordained a deacon in 1736. Upon his return to Oxford, after preaching his first sermon at Gloucester, he took the degree of bachelor, and diligently employed himself in communicating instruction to the poor and the prisoners. During the two following years, he acquired a great degree of popularity by his public services in London, Bath, Bristol, and other places; collecting large auditories, and interesting the attention of his hearers. His voice was strong and musical, his pronounciation clear and distinct, his imagination was lively, and his feelings were warm; and to these natural powers of eloquence we may add his selection of subjects, which were adapted to rouse the inconsiderate, and to comfort those that were awakened to a sense of their guilt and danger: so that we need not wonder that he should command a numerous audience. Upon receiving information that the province of Georgia was likely to open to him an extensive field of usefulness, he determined to visit it, and in May, 1738, arrived at Savannah. Here he met with much greater success than his predecessor Wesley; and in order to supply the defect of education which he was concerned to observe in this province, he resolved to found an orphan-house, and in 1739 returned to England in order to collect money for this purpose. In England, few of his clerical brethren were disposed to take much notice of him; nevertheless, his original patron, the bishop of Gloucester, gave him priest's orders: but upon afterwards visiting London, none of the churches into which he obtained admission were large enough to accommodate the crowds of people that assembled to hear him. It was about this time that he commenced his practice of preaching in the open fields, and the first scene of his exhibition in this way seems to have been Kingswood, near Bristol, where he collected thousands, chiefly of colliers, who, without doubt, derived benefit from his discourses. He also preached at Bristol in the open air, when he was refused access to the pulpits of the churches; and he likewise pursued the same practice in Moorfields and Kennington-common, near London, where, amidst the immense multitude that attended him, some persons occasionally treated him with rudeness, but the greater number were commanded by his peculiar power of address into respectful attention. Having succeeded beyond his expectations in soliciting contributions for his projected orphan-house in Georgia, he returned to America in August, 1739; and in the following January laid the foundation of the building at Savannah. He then extended his tour as far as Boston, preaching to immense crowds, and collecting considerable sums for the completion of his design; and upon his return to Savannah he found his orphan family comfortably settled in their house; and in January, 1741, he embarked for England. His absence had occasioned a declension among his followers; some other circumstances, besides the intermission of his personal labours amongst them, might probably have contributed to produce this effect. Whilst he was in America, he had written, as he himself acknowledges, "two well-meant but injudicious letters against England's two great favourites, the Whole Duty of Man, and archbishop Tillotson, who, I said, knew no more of religion than Mahomet." His society had suffered from the influence of the Moravians. Mr. Wesley had preached and printed in favour of *perfection* and *universal redemption*, and against the doctrine of election. He had written a reply, but he acknowledges that he had used expressions that were too strong in reference to ab-

solute reprobation, which had offended numbers of his spiritual children. At this time, a separation had taken place between him and Wesley, and this had occasioned a decrease of his auditors. However, his zeal and perseverance overcame these difficulties. In order to counteract Wesley's popularity, he built a shed near his chapel in Moorfields, which he called the Tabernacle; and in process of time this rose from a mean beginning to be a spacious edifice; and he also renewed his field-preaching. At this time he paid his first visit to Scotland; and though he was a clergyman of the church of England, which excited some prejudice against him, he was invited into the churches, and preached to large congregations, and made collections for his orphans. On his return by Wales, he married a Mrs. James, a widow lady of Abergavenny. His zeal for doing good, and for making proselytes, induced him, in the spring of 1742, to engage in a contest with the idle people who had booths in Moorfields, and where they frequented for their amusement on holidays. In 1748 he returned from a third voyage to America; and then commenced his acquaintance with the Countess of Huntingdon, who appointed him her chaplain, and excited the curiosity of some persons of rank to hear him: among these were the Earl of Chesterfield and Lord Bolingbroke. About this period, it is said, his sentiments became more rational; for on his third visit to Scotland, it was announced to a synod assembled at Glasgow to investigate certain charges against his opinions, that with regard to certain points which were considered as objectionable, his sentiments had been altered for upwards of two years; and that he now seldom preached a sermon without guarding his hearers against impressions, and admonishing them that a holy life is the best evidence of a state of grace. From this time, he was fully employed by a visit to Ireland, two more voyages to America, and his English circuits, till the year 1756, when his chapel in Tottenham-court-road was erected. His labours were incessant for many years; but at length, on a seventh visit to America, he was seized with an asthmatic complaint at Newbury-port, New England, which terminated his life in September, 1770, near the completion of his fifty-sixth year.

With regard to his general character, we shall close this article with the reflections of a judicious and candid biographer. "That he had much enthusiasm and fanaticism in his composition is sufficiently evident from his own journal and letters; but whether these were accompanied, as they are not unfrequently are, with craft and artifice, is a disputable point. There are, in his narratives, obvious marks of a disposition to represent himself as under the special protection of Providence, and to magnify trifling incidents into little less than miracles in his favour; and much of what is commonly called *cant* is apparent in his confessions and humiliations. He has been charged with dishonesty and immorality; yet as it is certain that he obtained the esteem of many persons of worth, it may be concluded that such accusations were destitute of proof. His intellectual qualities were well suited to the task he undertook; and if in the pulpit he occasionally intermixed buffoonery with his vehemence, the latter was not less effectual on that account. His learning and literary talents were mean, and he is a writer only for his own sect." He published, at intervals, sermons, tracts, and letters, which, after his death, were collected in six vols. 8vo.—*Middleton's Biog. Evangel. Mosh. Eccl. Hist. Gen. Biog.*

WHITE FLAG BAY, a bay on the west coast of the island of St. Christopher; 2 miles north of Sandy Point.

WHITEFORD, a hamlet of England, in Devonshire, near Lyme.

WHITEGATE, or NEW CHURCH, a parish of England, in Cheshire; 3 miles south-west of Northwich.

WHITEHALL, formerly SKENESBOROUGH, a post town-ship and village of the United States, in Washington county, New York, at the south end of Lake Champlain; 70 miles north of Albany, 170 north-west of Boston, and 25 south of Ticonderago. Population of the township 2110.

WHITEHALL, a township of the United States, in Lehigh

high county, Pennsylvania, on the Lehigh. Population 2551.

WHITEHALL, a post village of the United States, in Mecklenburg county, North Carolina.

WHITEHAM HILL, in Berkshire, England, 576 feet high.

WHITEHAVEN, a large, populous, and improving seaport and market town of England, in Cumberland, situated on a bay of the Irish sea. The town is built on a regular plan; the streets are generally spacious and clean, and cut each other at right angles. Buildings are neat, and many of them genteel: the shops exhibit a degree of elegance not often met with in the north: the houses are covered with blue slate, which gives the town a beautiful appearance from the adjoining heights. There are three churches, St. James, Trinity, and St. Nicholas; besides several meeting-houses, a Roman Catholic chapel, a public dispensary, a free school, lately endowed, charity schools, &c. Here is a commodious residence of the Earl of Lonsdale, called the Castle, which possesses some splendid paintings of the old masters. The piers, or moles of the harbour, have been greatly enlarged and improved. They are—1st, The Breast Work and Old Quay—2d, The Old Tongue—3d, the New Tongue—4th, The New Quay—5th, The New Work—6th, The North Wall. The New Work (formerly called the Bulwark), has been entirely rebuilt on a larger plan; and to the extremity of the old wall several yards have been added, which approach towards the New Work, and by narrowing the entrance into this part of the harbour, was intended to preserve the place from swells of the sea, but has proved in a great measure ineffectual. Besides these improvements, foundations were laid down in 1809, for further altering the harbour; but not yet built upon. Whitehaven contains six yards for ship-building; and it is not unusual to see 12 or 16 new vessels upon the stocks at the same time. The vessels built at Whitehaven have obtained considerable repute for strength, burden, and a small draught of water. Here are two sail-cloth manufactories of considerable extent, and three large roperies. A very handsome theatre, on a plan copied from that of the Bath theatre, was built by subscription, in 1769. Three banks have been opened here; one in 1786; another in 1793, and a third in 1807. The coal-works, being near the sea, are very convenient for shipping; some of these mines are wrought a great distance under the sea, and others beneath the town; which circumstance, in its consequence, occasioned great alarm to the inhabitants some years ago, when, owing to the falling in of some of the old coal-works, the ground under several of the houses gave way. About 18 houses were in this manner destroyed, and the pavement in one of the streets was rent in several places. This alarming accident happened in 1791.

Whitehaven has risen, within the last 170 years, from a few huts to a wealthy and flourishing town. In the survey taken in 1566, Whitehaven consisted only of six fishermen's cabins, and one small bark, about nine tons burden, sufficient to supply the religious society of St. Bees with fish, salt, and other articles of their diet. In 1633, there were no more than nine or ten thatched cottages. Sir John Lowther soon after conceiving the project of working the coal mines, and improving the commerce of this county, obtained from king Charles II. in 1666, a grant of all the ungranted lands within this district; and in 1678, he obtained all the lands, for two miles northward, between high and low water mark. From this period we may date the commencement of Whitehaven's flourishing state. The markets on Tuesday, Thursday, and Saturday, are well supplied with all kinds of provisions; and it has a fair the 12th August; 40 miles south-west of Carlisle, and 305 north-west of London. Population, in 1821, 16,522.

WHITEHAVEN, a post village of the United States, in Somerset county, Maryland.

WHITE HEAD, a cape of Ireland, on the coast of Antrim, at the entrance into Belfast Lough, a little to the south of Black Head.

Vol. XXIV. No. 1662.

WHITEHEAD (William), an English poet, was born at Cambridge in 1714-5, educated at Winchester school, where from his talent in writing verse he acquired the notice of Pope; and upon his return to Cambridge, obtained a scholarship of Clare-hall. As a poet, Whitehead's highest ambition was to resemble the manner of Pope; and of his proficiency he gave a specimen in his "Epistle on the Danger of writing Verse," 1741. In the following year he was elected fellow of Clare-hall, and pursued his studies with a view to the church; but his poetical talents produced a change in his circumstances, and in his purpose. Being recommended to the Earl of Jersey as a proper tutor for his eldest son, he removed, in 1745, to the earl's house in London, where his treatment was in the highest degree liberal. Having leisure for indulging his taste for literary pursuits, he turned his attention to dramatic composition, and produced a tragedy, entitled "The Roman Father," which was exhibited with applause upon the stage in Drury-lane in 1750. In 1754 he published another, the title of which was "Creusa," which was also favourably received. With the profits arising from these two performances he very honourably discharged the debts of his father, who had died insolvent. In this year he accompanied his pupil, Viscount Villiers, and Viscount Nuneham, son of Earl Harcourt, on their travels, which continued more than two years; and on his return he published an "Ode to the Tiber," and six elegiac epistles, which were much applauded. Lady Jersey, during his absence, had procured for him the appointment of secretary and register to the order of the Bath; and in 1757; on the death of Cibber, he succeeded to the laureat, which he rendered respectable; though in the discharge of the customary duties of the office, he did not escape abuse, and especially that of Churchill, whose popular satire almost overwhelmed the reputation of the laureat. Lady Jersey, in consideration of his services as governor to her son, invited him to take up his residence in her house, where he passed fourteen years, frequently visiting Lord Harcourt, much respected by his noble hosts and his former pupils. He still amused himself by presenting to the public occasional productions, one of which was a comedy of the moral or sentimental class, entitled "The School for Lovers." After passing through life tranquilly and pleasantly, and maintaining an estimable character, he died suddenly, April, 1785, in his 70th year. Of his works two volumes were published by himself, and to these a third was added by Mr. Mason, who prefixed memoirs of his life and writings, to which we refer.—*Gen. Biog.*

WHITEHEAD (George), an eminent person among the Quakers, was born in 1636, at Sunbigg, in Westmoreland. Attaching himself early in life to this society, and engaging in the propagation of his doctrine, he partook of the sufferings which, in that age, were the ordinary lot of its active members; and was once, simply for having preached at Nayland, in Suffolk, severely whipped by order of two justices as a vagabond; a proceeding which served, as might have been expected, to increase the disposition of the people to hear him.

In the year 1672, when Charles II. issued his declaration for suspending the penal statutes against non-conformists, Whitehead solicited and obtained an order under the great seal for the discharge of about four hundred Quakers, many of whom had been for years under close confinement. He records, with expressions of satisfaction, the circumstance that some other dissenters also partook at this time of the benefit of his exertions. On several other occasions he was concerned in applications on the Quakers' behalf to Charles II. and James II. And after the Revolution, when the Toleration Bill was before parliament, he was particularly serviceable to his friends in that matter; as likewise in taking a part in those representations, which procured the acceptance of their affirmation in lieu of an oath. A profession of faith being proposed for insertion in the above act, in terms which to the Quakers would not have been quite satisfactory, Whitehead and his coadjutors proposed the following, as their own belief on the points to which it relates, and which

6 Y

was

was adopted as a test for the society accordingly, viz., "I profess faith in God the Father, and in Jesus Christ his Eternal Son the true God, and in the Holy Spirit, one God, blessed for evermore; and do acknowledge the holy scriptures of the Old and New Testament to be given by divine inspiration."

He was well esteemed by his brethren, whom he continued to edify by his ministry and example to the end, dying, after a short confinement, by infirmity, at the age of 86. Besides several writings chiefly controversial, he left some memoirs of his life, which were printed in one volume, 8vo., in 1725.

WHITEHILL, two hamlets of England, one in Oxfordshire, the other in Kent.

WHITEHILLS, a considerable fishing town of Scotland, in the parish of Boyndie, in Banffshire, situated on the sea coast, about half way between the towns of Banff and Portsoy. Population about 460.

WHITEHORN, a parish of Scotland, in the county of Wigton; 8 miles long, and 4 broad, occupying the extremity of that peninsula of Wigtonshire formed by the bays of Wigton and Luce. Population 1935.—2. A small island of Scotland, near the south-east coast of the county of Wigton. Lat. 54. 46. N. long. 4. 27. W.

WHITEHORSE, a post village of the United States, in Hunterdon county, New Jersey.

WHITE HORSES, cliffs on the south coast of Jamaica; 20 miles east-south-east of Kingston.

WHITE HOUSE BAY, a bay on the west coast of the island of St. Christopher, a little to the north of Guiana point.

WHITEHURST (John), was born at Congleton, in Cheshire, in 1713, and brought up to the trade of his father, who was a watch-maker. At the age of 21 years he visited Dublin, in order to acquaint himself with the construction of a curious clock; but being disappointed, he engaged in business for himself at Derby, about two or three years after his return, where he distinguished himself by a variety of ingenious pieces of mechanism; and he thus established a reputation, which caused him to be consulted by all persons who wished to avail themselves of superior skill in mechanics, pneumatics, and hydraulics. In 1775 he was appointed, without any solicitation on his own part, stamper of the money weights; which office required his removal to London, where he spent the remainder of his days, and where his house was the resort of scientific men of various descriptions. In 1778 he published his "Inquiry into the original State and Formation of the Earth, of which an enlarged and improved edition appeared in 1786, and a third in 1792. In May, 1779, he was elected a fellow of the Royal Society. In 1783 he visited Ireland, to examine the Giant's Causeway, and the northern parts of the island; and the result of his inquiries was annexed to his work above-mentioned. Mr. Whitehurst, having been for some time subject to the gout, was at length carried off by a paroxysm of it in the stomach, in February, 1788, in the 75th year of his age, at his house in Bolt-court, Fleet-street. As a man of science, he was much respected by all who knew him; but he was still more estimable on account of his moral qualities. His papers on Chimneys, Ventilation, and Garden-stoves, were collected and published in 1794, by Dr. Willan. His papers in the Philosophical Transactions, printed afterwards in the collection of his works in 1792, were the following: viz., "Thermometrical Observations at Derby," in vol. lvii.; "An Account of a Machine for raising Water at Oulton in Cheshire," vol. lxxv.; and "Experiments on ignited Substances," vol. lxxvi. *Hutton's Math. Dict.*

WHITE INLET, or **BOCA DE RATONES**, an inlet on the east coast of East Florida. Lat. 26. N. long. 80. 20. W.

WHITE ISLAND, an island in the South Pacific ocean, near the east coast of New Zealand, north of Cape Runaway. Lat. 37. 31. S. long. 182. 36. W.

WHITE ISLAND, a small island in the Atlantic, near the south-east coast of Nova Scotia. Lat. 42. 55. N. long. 61. 56. W.

WHITEKIRK, a parish of Scotland, in Haddingtonshire, united to Tynninghame.—Also a small village in that parish; 9½ miles north-east from Haddington.

WHITE LADY ASTON, a parish of England, in Worcestershire, near Worcester.

WHITE LAKE, a post village of the United States, in Bethel, New York.

WHITELAND, EAST, a township of the United States, in Chester county, Pennsylvania. Population 779.

WHITELAND, WEST, a township of the United States, in Chester county, Pennsylvania. Population 635.

WHITELEAD, s. *White lead* is made by taking sheet-lead, and having cut it into long and narrow slips, they make it up into rolls, but so that a small distance may remain between every spiral revolution. These rolls are put into earthen pots, so ordered that the lead may not sink down above half way, or some small matter more, in them: these pots have each of them very sharp vinegar in the bottom, so full as almost to touch the lead. When the vinegar and lead have both been put into the pot, it is covered up close, and so left for a certain time; in which space the corrosive fumes of the vinegar will reduce the surface of the lead into a mere white calx, which they separate by knocking it with a hammer. There are two sorts of this sold at the colour shops, the one called ceruse, which is the most pure part, and the other is called *white lead*.—*Quincy.*

WHITELIMED, adj. Covered with white plaister.—*Ye white-lim'd walls. Titus Andronicus.*

WHITELIVERED, adj. Envious; malicious; cowardly.—*Whitelivered* runagate, what doth he there? *Shakespeare.*

WHITELOCK (Bulstrode), a lawyer and statesman, was born in London in the year 1605, and finished his education as a gentleman-commoner of St. John's College, Oxford. Being destined for the profession of the law, he pursued the study of it under the direction of his father, sir James White-lock, who was one of the justices of the King's Bench. As he had a taste for the fine arts, he was nominated as one of the chief managers of the royal masque presented by the inns of court to Charles I. and his queen in 1633, of which he has given a florid description. He became soon distinguished in his profession at the bar, and was frequently consulted by Hampden, when he was under prosecution for resisting the imposition of ship-money. In 1640 he was elected as a representative for Marlow in the Long parliament; and though his principles were favourable to the measures which then engaged the public attention, he concurred with Selden and others in deprecating a resort to arms; but when the house had determined for war, he accepted the post of deputy-lieutenant for the counties of Oxford and Buckingham, and appeared at the head of a gallant company of horse raised among his neighbours. Nevertheless, he was always averse from a civil contest; and, in January, 1642-3, he was one of the commissioners appointed to treat of peace with the king at Oxford; and, in 1644, he was one of those who presented to the king propositions of peace agreed upon in parliament; and the king's answer was, at his majesty's request, drawn up by him and Holles, for which they were accused of high treason by parliament, but extricated themselves with honour. As a member of the assembly at Westminster for settling the form of church government, he avowed himself in opposition to the divine right of presbytery. He also opposed the power of excommunication assumed by the presbyterians; being always, like Selden, an enemy to violent exertions of church power by any party; and he was an invariable advocate of legal rights, and an opposer of arbitrary power, assumed or exercised in either house of parliament. To Cromwell he was so agreeable, that he was one of the four members of parliament appointed to meet him after his famous victory at Worcester, in 1651. Whitelock avowed himself steadily attached to monarchy, as a part of the state which could not be dispensed with, and as interwoven with the laws of the country; and he therefore suggested, that the late king's eldest or second son should be sent for, and enter into terms for securing the liberties of the nation.

Upon

Upon the dissolution of parliament by Cromwell, though he had previously resisted the attempts of the army to govern without the parliament, he obsequiously performed the functions of his office under the new establishment. Having concluded an advantageous treaty with queen Christina, who received him in November, 1653, with distinction, he returned to his own country, and resumed the office of commissioner of the great seal, upon the restoration of the court of chancery; and he was returned as a representative for three counties in Cromwell's second parliament. He was free and faithful in giving salutary advice to the Protector, and, nevertheless, retained his confidence. Declining the office of ambassador to Sweden, which was offered him, he acted as one of the commissioners to treat with the Swedish ambassador in England. He was returned for Buckinghamshire in Cromwell's third parliament, and officiated for some time as speaker. When Monk proposed to restore the remains of the Long parliament, Whitelock took a commission from the committee of safety for raising a regiment of horse, and urged Lambert to march against that leader. But the design failing, and the parliament meeting, he just appeared in pursuance of the speaker's summons; and as he had reason for suspecting a design to apprehend him, he returned to a friend's house in the country, and sent the great seal by his wife to the speaker;—and thus terminated his public life. Upon the Restoration, he had the good fortune to escape a bill of pains and penalties in the house of commons, only by the negative of a small majority. After having passed fifteen years in retirement, chiefly at Chilton-park, in Wiltshire, he there died in January, 1676; leaving a numerous family, after having been twice married.

After his death, an anonymous editor, in 1682, published his "Memorials of the English Affairs; or, an historical Account of what passed from the Beginning of the Reign of King Charles I. to King Charles II. his happy restoration," fol.; an improved edition of which appeared in 1732. From his MSS. were published in 1709, "Memorials of the English Affairs from the supposed Expedition of Brute to this Island, to the End of the Reign of King James I.," a chronological epitome of history for his own use. In 1766, Dr. Charles Morton, secretary to the Royal Society, published "Whitelock's Notes upon the King's Writ for choosing Members of Parliament, 13 Car. II.; being Disquisitions on the Government of England by King, Lords, and Commons," 2 vols. 4to. The same editor also published, in 1772, "A Journal of the Swedish Embassy in the Years 1653 and 1654, from the Commonwealth of England, Scotland, and Ireland; written by the Ambassador the Lord Commissioner Whitelock; with an Appendix of original Papers," 2 vols. 4to.—*Biog. Brit. Gen. Biog.*

WHITELY, *adj.* Coming near to white.

Now, governor, I see I must blush
Quite through this veil of night a *whitely* shame,
To think I could design to make those free,
Who were by nature slaves. *Southern.*

WHITELYSBURG, a post village of the United States, in Kent county, Delaware.

WHITEMARSH, a post township of the United States, in Montgomery county, Pennsylvania.

WHITEMARSH, a township of the United States, in Montgomery county, Pennsylvania, on the Schuylkill. Here are valuable quarries of marble; 12 miles north-west of Philadelphia. Population 1328.

WHITE MOUNTAINS, or WHITE HILLS, a range of mountains of the United States, in New Hampshire, 18 or 20 miles long, and 8 or 10 broad. In the western pass of these mountains there is a remarkable gap, called the Notch. These mountains have been ascended by different routes. The course which is usually considered as attended with the least difficulties, is that which commences at the plain of Conway, and follows the course of Ellis river, a northern branch of the Saco, having its origin high in the mountains. The view from the summit is rendered wonderfully grand and picturesque, by the magnitude of the elevation, the

extent and variety of the surrounding scenery, and, above all, by the huge and desolate pile of rocks, extending to a great distance in every direction. These mountains are covered with snow nine or ten months in the year, and derive their name from their white appearance. They are seen many miles off at sea; and a person, when on their summit, has a distinct view of the Atlantic ocean, the nearest part of which is 65 miles distant in a direct line. The limit of forest trees is at the height of 4428 feet. The sides are composed of micaceous schistus, and the summit of gneiss. The elevation of Mount Washington was formerly estimated at 10,000 or 11,000 feet; but late computations, founded on barometrical observation, have much reduced it; one making it 7108, another 6634, another 6234, another 6225, and another 6103. The following table exhibits the elevation of the several peaks, according to an accurate measurement.

	Feet above the Sea.	Feet above the Base.
Mount Washington,.....	6234.....	4464
2d peak,.....	5328.....	3554
3d peak,.....	5058.....	3288
4th peak,.....	4866.....	3096
5th peak,.....	4711.....	2941
6th peak,.....	4356.....	2586

Base of the mountains, 1770 feet above the sea. The base of the mountains is about 25 miles south-east of Lancaster; and Mount Washington, the highest summit, is 70 miles in a right line north of Concord, and 82 north-by-west of Portsmouth. Lat. 44. 15. N. long. 71. 20. W.

WHITEMEAT, *s.* Food made of milk.—Much saltiness in *whitemeat* is ill for the stone. *Tusser.*

To WHITEN, *v. a.* To make white.—The smoke of sulphur will not black a paper, and is commonly used by women to *whiten* tiffanies. *Brown.*

To WHITEN, *v. n.* To grow white.

The bark expects its freight;

The loosen'd canvas trembles with the wind,

And the sea *whitens* with auspicious gales. *Smith.*

WHITENER, *s.* One who makes any thing white.

WHITENESS, *s.* The state of being white; freedom from colour.—*Whiteness* is a mean between all colours, having disposed itself indifferently to them all, so as with equal facility to be tinged with many of them. *Newton.*—Paleness.

Thou tremblest, and the *whiteness* of thy cheek,
Is apter than thy tongue to tell thy errand. *Shakspeare.*

Purity; cleanness.—The least spot is visible on ermine; but to preserve this *whiteness* in its original purity, you have, like that ermine, forsaken the common track of business, which is not always clean. *Dryden.*

WHITEN-HEAD, a promontory of Scotland, on the north coast of Sutherland, in the parish of Durness.

WHITE OAK, a post village of the United States, in Rutherford county, North Carolina.—2. A small river of North America, which falls into the Ohio, between the Little Miami and the Scioto.

WHITE OAK CREEK, a river of the United States, in North Carolina, which runs into the Atlantic, Lat. 34. 39. N. long. 77. 26. W.

WHITE OAK MOUNTAINS, mountains of the United States, in the west part of North Carolina. Lat. 36. 10. N. long. 82. 30. W.

WHITE OAK SPRING, a post village of the United States, in Gibson county, Indiana.

WHITEOXMEAR, a hamlet of England, in the parish of Wellow, Somersetshire.

WHITE PLAINS, a post village of the United States, in Orange county, Virginia.—2. A post village of Granville county, North Carolina.—3. A post village of White county, Tennessee.—4. A post township and village of the United States, in West Chester county, New York; 14 miles south of Bedford, and 30 north-east of New York. Population 693.

WHITE PORT, a post village of the United States, in Frederick county, Virginia.—2. Of Lawrence county, Mississippi.

WHIT'EPOT, *s.* A kind of food.—Cornwall squab-pye, and Devon *whitepot* brings. *King.*

WHITE RIVER, a river of the United States, in Vermont, which rises in Kingston, and runs into the Connecticut at Hartford. Length 50 miles.

WHITE RIVER, a river of the United States, in Indiana, which rises about Lat. 40. 45. N. long. 85. 5. W., and runs into the Wabash, Lat. 38. 19. N. long. 88. 20. W. Length 200 miles. It is itself a stream of considerable importance, draining the heart, and by far the finest part of the state of Indiana. About 40 miles above its junction with the Wabash, White river divides into the North and South branches. North branch rises in the Indian country, by a number of creeks, which uniting near the Indian boundary line, forms a fine navigable river of about 180 miles in length; its course nearly south-west. South branch rises in the same ridges with the White Water branch of the Great Miami; its course south-west by west 150 miles.—2. A river of the island of Guadaloupe, which falls into the river San Luis.—3. A river of Jamaica, which runs into the sea; 4 miles west of Morant bay.—4. A river of the United States, in Louisiana, which runs into the Missouri; 1130 miles from the Mississippi.—5. A township of the United States, in Knox county, Indiana. Population 974.—6. A river of the United States, in the Missouri Territory, which rises about 300 miles west of the Mississippi, and, after a winding course of about 700 miles, falls into the Mississippi, near its junction with the Arkansaw.

WHITE ROCK, a post village of the United States, in Charlotte county, Virginia.—2. A post village of Halifax county, Virginia.—3. A rocky islet in the Eastern seas, near the south coast of Java.

WHITES, *s.* [*fluor albus.*] It arises from a laxness of the glands of the uterus, and a cold pituitous blood. *Quincy.*

WHITESBOROUGH, a post village of the United States, in Oneida county, New York. It is a very pleasant, handsome, and flourishing village; 4 miles north-west of Utica, and 97 west-by-north of Albany.

WHITE SEA, called by the Russians BIELÆ MORE, a great gulf of the Northern ocean, which may be said to penetrate into the Russian territory, to a depth of 300 or 400 miles. The White sea extends from Lat. 63. 45. to 68. 25. N. and from long. 32. to 46. E.

WHITESIDELAW, a township of England, in Northumberland; 7½ miles north-north-east of Hexham.

WHITE-STANTON, a parish of England, in Somersetshire, near Chard.

WHITESTON, a parish of England, in Devonshire, near Exeter. Population 515.

WHITESTONE, a river of the United States, in Louisiana, which runs into the Missouri, 918 miles from the Mississippi.

WHITESTOWN, a post township of the United States, and capital of Oneida county, New York, on the south side of the Mohawk river. Population 4912.

WHITE SULPHUR SPRINGS, a post village of the United States, in Greenbriar county, Virginia.

WHITESVILLE, a post town of the United States, and capital of Columbus county, North Carolina.

WHITE SWELLING. See SURGERY.

WHIT'THORN, *s.* [*spina alba*, Latin.] A species of thorn.—As little as a *whitethorn* and a pear-tree seem of kin, a scion of the latter will sometimes prosper well, being grafted upon a stock of the former. *Boyle.*

WHIT'EWASH, *s.* A wash to make the skin seem fair.—The clergy, during Cromwell's usurpation, were very much taken up in reforming the female world; I have heard a whole sermon against a *whitewash*. *Addison.*—A kind of liquid plaster with which walls are whitened.

Four rooms, above, below, this mansion grac'd,
With *white-wash* deckt, and river-sand o'er-cast. *Harte.*

To WHIT'EWASH, *v. a.* To cover with whitewash. *Mason.*

WHITEWATER, a river of England, in the Isle of Man, which runs into the sea at Douglas.—2. A township of the United States, in Hamilton county, Ohio. Population 910.—3. A river of the United States, which rises in Indiana, and runs into the Great Miami, 4 miles in a direct line above its junction with the Ohio: This river owes its name to the unusual transparency of its water, a fish or pebble being visible at the depth of 20 feet.

WHITE WOMAN'S RIVER, in the United States, a main branch of the Muskingum, which it joins at Coshocton.

WHIT'EWINE, *s.* A species of wine produced from the white grapes.—The seeds and roots are to be cut, beaten, and infused in *whitewine*. *Wiseman.*

WHITEWYND, or WHITE-WOOLLEN-HILL, a beautiful green hill of Scotland, in Dumfries-shire, in the parish of Dryfesdale, which commands a delightful prospect of the surrounding country.

WHITFIELD, or BEAUFIELD, a parish of England, in Kent; 3 miles north-north-west of Dover.

WHITFIELD, a township of England, in Devonshire; 9 miles north-by-west of Chapel-en-le-Frith.—2. A hamlet in Gloucestershire, in the parish of Deerhurst. Population 399.—3. A parish in Northamptonshire; 2 miles north-east of Brackley.—4. A parish in Northumberland; 11 miles west-south-west of Hexham. Population 330.

WHITFORD, a hamlet of England, in the parish of Shute, Devonshire.

WHITGIFT, a township of England, West Riding of Yorkshire; 6 miles south-east of Howden.

WHITGIFT (John), an English prelate, was born at Great Grimsby, Lincolnshire, in 1530, and in 1548 entered at Queen's College, Cambridge, from which he removed to Pembroke-hall, where he enjoyed the tuition of John Bradford, afterwards one of the Protestant martyrs. In 1555 he became a fellow of Peter-house, and in 1557 commenced M. A. Upon the visitation of the University by cardinal Pole, about this time, for the purpose of purging it of reputed heretics, Whitgift dreaded the search, but by favour of the vice-chancellor escaped, and remained in the university. Upon the accession of queen Elizabeth, he entered into orders in 1560, and obtained preferment from Dr. Cox, bishop of Ely. In 1563 he was appointed Margaret professor of divinity, and chaplain to the queen in 1565. Continuing in the university, and maintaining the character of a good preacher and vigorous disciplinarian, his salary as professor was advanced, and a licence was granted him to preach in any part of the realm, In 1567 he was made master of Pembroke-hall, and soon after regius professor of divinity. He next became master of Trinity College, and graduated D. D.; and on his appointment to keep the commencement-act, he chose for his thesis "The Pope is the Antichrist." In 1570 he formed a body of statutes for the university; in consequence of which the heads of houses gained new powers, by the exercise of which he deprived Cartwright, an eminent Calvinistic divine, of his Margaret professorship. In 1571 he was vice-chancellor of the university, in the exercise of which office he manifested so much zeal for the established church, that the queen conferred upon him the deanery of Lincoln, besides other dignities and honours. He also expelled Cartwright from his fellowship, and carried on a controversy with that divine and other Puritans in general. In 1577 he was advanced to the see of Worcester, and the office of vice-president of the council for the marches of Wales. Upon his advancement to the prelacy, he resigned his mastership of Trinity College, and devoted himself to the duties of his new office, taking care to improve its revenues; and in the exercise of a power, which he obtained from the crown by the interest of lord Burleigh, to bestow the prebends of his church on his own friends according to his own selection.

His reputation as a man of business increased; and in 1582 he was nominated by the archbishop of Canterbury, Grindal, chief commissioner for settling disputes in the dioceses of Lichfield and of Hereford. Grindal's remissness in executing

executing the laws against the non-conforming clergy displeased the queen, and caused her to suspend him from his functions; and on his death in 1583, Whitgift, who had secured her favour by his zeal for the church and hostility to the Puritans, was appointed to succeed him. He did not disappoint her expectations; but engaged her to issue a new ecclesiastical commission, more arbitrary, and possessing more extensive authority than any former one. Its jurisdiction extended over the whole kingdom, and comprehended all orders of men; and, as Hume describes it, "every circumstance of its authority, and all its methods of proceeding, were contrary to the clearest principles of law and natural equity." "In a word," says he, "this court was a real *inquisition*, attended with all the iniquities, as well as cruelties, inseparable from that tribunal." The measures of Whitgift were in unison with the constitution and spirit of this commission; and the council itself interposed to moderate them. In reply to the remonstrance of the council in favour of some ministers of Ely, who had been suspended for refusing to answer interrogatories, he said, "Rather than grant them liberty to preach, he would choose to die, or live in prison all the days of his life." To the queen he recommended "suppressing" the discipline proposed by the Puritans, "rather than confuting it by writing;" and he advised that a restraint should be laid upon the liberty of the press at Cambridge. Accordingly, he was very acrimoniously attacked in a pamphlet, entitled "Martyn Marprelate," in which he was compared to the most ambitious and tyrannical churchmen of former times. Whitgift, however, blended with the violence of his temper some degree of kindness and good humour.

Upon the accession of king James, Whitgift felt some alarm, under the apprehension of some changes in the liturgy; and it has been supposed that his agitated state of mind concurred with the debility of age, and the operation of some other causes, in producing the paralytic attack which terminated his life in February, 1603-4. A monument was erected to his memory at Croydon, where he was interred. Whitgift was neither a man of learning, the Latin language bounding his classical literature, nor a profound theologian. He was principally distinguished by his vigour and activity as a man of business. As a preacher he was popular; and this talent, in which he excelled, laid the foundation of his advancement.

WHITGREAVE, a township of England, in Staffordshire; 3 miles north-north-west of Stafford.

WHITHAM, FRIARY, a parish of England, in Somersetshire; 5 miles from Frome. Population 533.

WHIT'THER, *adv.* [hpyðer, Saxon; *hwader*, M. Goth.] To what place? Interrogatively.

The common people swarm like summer flies; And *whither* fly the gnats, but to the sun? *Shakspeare.*

To what place? Absolutely.—I stray'd I knew not *whither*. *Milton.*—To which place; relatively.

Whither, when as they came, they fell at words, Whether of them should be the lord of lords. *Spenser.*

To what degree? *Obsolete; perhaps never in use.*

Whither at length wilt thou abuse our patience? Still shall thy fury mock us? *B. Jonson.*

Whithersoever.—Thou shalt let her go *whither* she will. *Deut.*

WHITHERSOE'VER, *adv.* To whatsoever place.—For whatever end faith is designed, and *whithersoever* the nature and intention of the grace does drive us, thither we must go, and to that end we must direct all our actions. *Bp. Taylor.*

WHITHORN, a parish of Scotland, in the county of Wigton, about 8 miles long and 4 broad, occupying the extremity of that peninsula of Wigtonshire formed by the bays of Wigton and Luce.

WHITHORN, or **WHITHERN**, a royal burgh in the above parish, seated on the bay of Wigton, where a small stream of water falling into it forms a safe harbour. *Whithorn* is governed by a provost, two bailies, and 15 councillors.

VOL. XXIV. No. 1662.

It unites with the burghs of New Galloway, Wigton, and Stranraer, in sending a member to the British parliament. It is a place of great antiquity, having been a Roman station, the capital of the *Norvantes*, and the oldest bishopric in Scotland, being the seat of the bishop of Galloway. The cathedral, of which there are now scarce any remains, was founded in the 4th century, by St. Ninian, who dedicated it to St. Martin; 97½ miles south of Glasgow, 11 south of Wigton, and 115½ south-west of Edinburgh.

WHIT'TING, *s.* [*witlingh*, Dutch; *alburnus*, Latin.] A small sea-fish.—Some fish are gutted, split, and kept in pickle, as *whiting* and mackerel. *Carew.*—A soft chalk.—That this impregnated liquor may be improved, they pour it upon *whiting*, which is a white chalk or clay finely powdered, cleansed, and made up into balls. *Boyle.*

WHITING, a post township of the United States, in Addison county, Vermont; 50 miles south-west of Montpelier. Population 565.

WHITING BAY, a bay on the south coast of Ireland, in the county of Waterford, a little to the east of Youghall Bay.

WHITTINGHAM, a post township of the United States, in Windham county, Vermont; 23 miles east-south-east of Bennington. Population 1248.

WHIT'TISH, *adj.* Somewhat white.—The same aquafortis, that will quickly change the redness of red lead into a darker colour, will, being put upon crude lead, produce a *whitish* substance, as with copper it did a bluish. *Boyle.*

WHIT'TISHNESS, *s.* The quality of being somewhat white.—Take good venereal vitriol of a deep blue, and compare with some of the entire crystals, purposely reserved, some of the subtle powder of the same salt, which will exhibit a very considerable degree of *whitishness*. *Boyle.*

WHITKIRK, a township of England, West Riding of Yorkshire; 4 miles east of Leeds.

WHIT'TLEATHER, *s.* Leather dressed with alum, remarkable for toughness.

Whole bridle and saddle, *whit'tlether* and nal, With collars and harneis. *Tusser.*

WHITLEY, a hamlet of England, in Berkshire; 2 miles south-by-east of Reading.—2. A township in Lancashire; 4 miles west-by-south of Colne.—3. A township in Northumberland; 2½ miles north-west-by-west of Tynemouth.—4. A hamlet in the parish of Wootton Wawen, Warwickshire.—5. A hamlet in the parish of Staple-Fitzpaine, Somersetshire.—6. A township in the West Riding of Yorkshire; 5½ miles west of Snaith.

WHITLEY, a township of the United States, in Green county, Pennsylvania. Population 1264.

WHITLEY, LOWER or **NETHER**, a township of England, in Cheshire; 5 miles north-west of Northwich.

WHITLEY, LOWER, a township of England, West Riding of Yorkshire; 5 miles south-west of Wakefield. Population 746.

WHITLEY, GREAT, a parish of England, in the county of Worcester; 10 miles from Worcester. Population 414.

WHITLEY, UPPER or **OVER**, a township of England, in Cheshire; 6 miles north-north-west of Northwich.

WHITLEY, OVER, a township of England, West Riding of Yorkshire; 4 miles east of Huddersfield.

WHIT'LOW, *s.* [hpyt, Saxon, and *loup*, a wolf, *Skinner*; hpyt, Saxon, and *low*, a flame. *Lye.*] A swelling between the cuticle and cutis, called the mild whitlow, or between the periosteum and the bone, called the malignant whitlow.—Paronychia is a small swelling about the nails and ends of the fingers, by the vulgar people generally called *whitlow*. *Wiseman.*

WHITMORE, a parish of England, in Staffordshire, on the river Sow; 4½ miles south-west of Newcastle-under-Lyne.

WHITNASH, a parish of England, in Warwickshire; 3 miles from Warwick.

WHITNEL, a hamlet of England, in the parish of St. Cuthbert, Somersetshire.

WHITNEY, a parish of England, in Herefordshire; $7\frac{1}{2}$ miles south-south-west of Kington.

WHITPAINE, a township of the United States, in Montgomery county, Pennsylvania. Population 955.

WHITREY, a hamlet of England, in the parish of Uploman, Devonshire.

WHITRIDGE, a township of England, in the parish of Hartburn, Northumberland.

WHITRIGG, a hamlet of England, in Cumberland, near Cockermouth.

WHITSAND BAY, a bay of Wales, in Pembrokeshire, near St. David's, at the entrance of which lie the rocks called the Bishop and his Clerks.

WHITSHED, CAPE, a cape on the west coast of North America, and north-east point of entrance into Prince William's sound. Lat. 60. 29. N. long. 214. 29. E.

WHITSOM and HILTON, a united parish of Scotland, in Berwickshire, about $4\frac{1}{2}$ miles long, and $2\frac{1}{2}$ broad. Population 536.

WHIT'SOUR, *s.* A kind of apple.

WHITSTAPLE, a village and parish of England, in the county of Kent, and a small seaport. From hence the city of Canterbury is supplied with coals; and several vessels trade to London. Here is a considerable oyster fishery; 5 miles north of Canterbury.

WHITSTER, or WH'TER, *s.* A whitener.—Carry it among the *whitsters* in Datchet mead. *Shakspeare.*

WHITSTON, a parish of England, in Monmouthshire; $5\frac{1}{2}$ miles south-east of Newport.

WHITSTONE, a parish of England, in Cornwall; 5 miles south-south-east of Stratton.

WHIT'SUL, *s.* A provincial word.—Their meat was *whitsul*, as they call it, namely, milk, sour milk, cheese, curds, butter. *Carew.*

WHITSUN, *adj.* Observed at Whitsuntide.—Busied with a *Whitsun* morrice-dance. *Shakspeare.*

WHITSUN ISLAND, an island in the South Pacific ocean, discovered by captain Wallis, on Whitsun eve, in the year 1767; about four miles long, and three wide, surrounded by a reef. The boat's crew got some cocoa-nuts, and some scurvy-grass. They met with none of the inhabitants, but some huts and several canoes building. No anchoring place for the ship could be discovered. Lat. 19. 26. S. long. 137. 56. W.

WHITSUN, or WHITSUNDAY ISLAND, or PENTECOST, one of the New Hebrides, in the South Pacific ocean, about thirty miles in length, and eight in breadth. Lat. 15. 44. S. long. 168. 20. E.

WHITSUNDAY, CAPE, a cape on the south side of the island of Kodiak, in the North Pacific ocean. Lat. 58. 14. N. long. 208. 4. E.

WHITSUNDAY'S PASSAGE, a strait so called by captain Cook, from the day on which he sailed through it, in 1770; between Cumberland island and the coast of New Holland.

WHI'TSUNTIDE, *s.* [*white* and *sunday*; because the converts, newly baptized, appeared from Easter to Whitsuntide in white. *Skinner.*] The feast of Pentecost.

Strephon, with leafy twigs of laurel tree,
A garland made on temples for to wear;
For he then chosen was the dignity
Of village lord that *Whitsontide* to bear.

Sidney.

WHITSUNTIDE BAY, the passage which separates the islands of Kodiak and St. Hermogenes which lie about 60 miles from the entrance of Cook's inlet in the North Pacific ocean. It was so called by Cook who had not ascertained that the land was here divided into two islands, and that what he supposed to be a bay was the strait by which they were separated.

WHITTADDER, or WHITE-WATER, a river of Scotland in Berwickshire, which has its rise in the Lammermuir mountains, in the parish of Whittinghame, in East Lothian, and taking a course nearly south, is joined by Bothwell water at St. Agnes, and by the Blackadder at the village of Allan

town. From thence its course is south-east, and it falls into the Tweed, about five miles above Berwick. It abounds with excellent trout and salmon. The Whittadder is subject to frequent inundations, one of which, in October, 1775, was so dreadful, that almost every bridge on the river was swept away by the torrent.

WHITTENTREE, *s.* [*sambucus aquatica.*] A sort of tree. *Ainsworth.*

WHITTINGHAM, a township of England, in the county of Northumberland; $8\frac{1}{2}$ miles west-by-south of Alnwick. Population 715.—2. A township in Lancashire; $4\frac{1}{2}$ miles north-north-east of Preston. Population 587.

WHITTINGTON, or WITTINGTON, a parish of England, in Worcestershire; $2\frac{1}{2}$ miles south-east of Worcester.

WHITTINGTON, LITTLE, a hamlet of England, in Northumberland; $6\frac{1}{2}$ miles north-east of Hexham.

WHIT'TLE, *s.* [*hpytel*, Saxon.] A white dress for a woman. *Not in use.* *Dr. Johnson.*—Grose mentions the *whittle* as a double blanket; worn by the west-country women over their shoulders, like cloaks.—[*hpytel.*] A knife.

There's not a *whittle* in th' unruly camp,

But I do prize it at my love, before

The reverend'st throat in Athens.

Shakspeare.

T. WHIT'TLE, *v. a.* To cut with a knife.—To edge; to sharpen. *Not in use.*—When they are come to that once, and are thoroughly *whittled*, then shall you have them cast their wanton eyes upon men's wives. *Hakewill.*

WHIT'TLE, a township of England, in Derbyshire; $6\frac{1}{2}$ miles north-west of Chapel-en-le-Frith.—2. A township in Northumberland; $4\frac{1}{2}$ miles south of Alnwick.—3. A hamlet in the parish of Ovingham, Northumberland.

WHIT'TLE, WELSH, a township of England, in Lancashire; 3 miles south-west of Chorley.

WHIT'TLE-LE-WOOD, a township in the above county, near the foregoing.

WHIT'TLEBURY, a township of England, in the county of Northampton; $3\frac{1}{2}$ miles south-by-west of Towcester.

WHIT'TLESEY, ST. ANDREW'S and ST. MARY'S, two united parishes of England, in the Isle of Ely, county of Cambridge; $10\frac{1}{2}$ miles west-south-west of March. Population 4248.

WHIT'TLESFORD, a parish of England, in Cambridgeshire; 6 miles west of Linton.

WHITTON, a township of England, county of Durham; 5 miles north-west of Stockton-upon-Tees.—2. A parish of England, in Lincolnshire; 11 miles north-north-west of Barton-upon-Humber.—3. A township in Northumberland $12\frac{1}{2}$ miles south-west of Alnwick.—4. A township in Salop; 5 miles east-south-east of Ludlow.—5. A parish in Suffolk; $1\frac{1}{2}$ mile north-west of Ipswich.—6. A hamlet in the parish of Isleworth, Middlesex.—7. A parish of Wales, in Radnorshire; 3 miles from Presteign.

WHITTONSTALLS, a township of England, in Northumberland; $9\frac{1}{2}$ miles south-east of Hexham.

WHITWELL, a parish of England, in Derbyshire; 11 miles east-north-east of Chesterfield. Population 707.—2. A parish in Norfolk; 1 mile south-west of Reepham.—3. A parish in Rutlandshire; $4\frac{1}{2}$ miles east of Oakham.—4. A parish in the Isle of Wight, Southamptonshire; $7\frac{1}{2}$ miles south-by-east of Newport. Population 397.—5. A hamlet in Westmoreland; $4\frac{1}{2}$ miles north-by-east of Kendal.—6. A township in the North Riding of Yorkshire; 6 miles south-west of New Malton.—7. Another township in the above Riding; 3 miles east-north-east of Catterick.

WHITWICK, a township of England, in Leicestershire; $5\frac{1}{2}$ miles east-by-south of Ashby-de-la-Zouch. Population 895.

WHITWOOD, a township of England, West Riding of Yorkshire; 4 miles north-west of Pontefract.

WHITWORTH, a township of England, county of Durham; 4 miles north-east of Bishop Auckland.—2. A hamlet in Lancashire, near Rochdale.

WHI'TYBROWN, *adj.* Of a colour between white and brown; as, *whitybrown* paper, *whitybrown* bread. *Pegge.*

WHIXLEY,

WHIXLEY, a township of England, West Riding of Yorkshire; $6\frac{1}{2}$ miles south-south-east of Aldborough. Population 418.

WHIXOE, a parish of England, in Suffolk; $4\frac{1}{2}$ miles west-south-west of Clare.

To WHIZ, *v. n.* [from the sound that it expresses.] To make a loud humming noise.

The exhalations, *whizzing* in the air, Give so much light, that I may read by them. *Shakspeare.*

WHIZ, *s.* A loud humming noise.—He never once ducked at the *whiz* of a cannon-ball. *Guardian.*

WHO, *pronoun*, genitive *whose*; other cases *whom*. [hpa, Saxon; *wie*, Dutch.] A pronoun relative, applied to persons.

Oft have I seen a timely-parted ghost;
Of ashy semblance, meagre, pale, and bloodless,
Being all descended to the lab'ring heart,
Who, in the conflict that it holds with death,
Attracts the same for aidance 'gainst the enemy. *Shakspeare.*

Which of many.—We are still as much at a loss, *who* civil power belongs to. *Locke.*—*As who should say*, elliptically for *as one who should say*.—Hope throws a generous contempt upon ill usage, and looks like a handsome defiance of a misfortune: *as who should say*, you are somewhat troublesome now, but I shall conquer you. *Collier.*—*Whose* is the genitive of *which*, as well as of *who*, and is applied to things.—Is there any other doctrine, *whose* followers are punished? *Addison.*—It has sometimes a disjunctive sense.

There thou tell'st of kings, and *who* aspire;
Who fall, *who* rise, *who* triumphs, *who* do moan. *Daniel.*

It is used often interrogatively; as, *who* is this? meaning, what is the character or name of this person? *Who* shall do this? that is, where shall any be found that can do this?—In the grave *who* shall give thee thanks? *Psalms.*

WHOE'VER, *pronoun*. Any one, without limitation or exception.

Whoever doth to temperance apply
His steadfast life, and all his actions frame,
Trust me, shall find no greater enemy,
Than stubborn perturbation to the same. *Spenser.*

WHOLE, *adj.* [palz, Saxon; *heel*, Dutch. *Serenius* notices *heill*, Icel. *hel*, Sueth. integer totus; *oll*, *holh*, Cambr. idem. This will lead us to the Greek *olos*, the very same. Our word was formerly written *hole*.] All; total; containing all.—All the *whole* army stood agaz'd at him. *Shakspeare.*—Complete; not defective.

The elder did *whole* regiments afford,
The younger brought his fortune and his sword. *Waller.*

Uninjured; unimpaired, [*hails*, M. Goth. sanus.]—Anguish is come upon me, because my life is yet *whole* in me. *Sam.*—Well of any hurt or sickness.—When they had done circumcising all the people, they abode in the camp, till they were *whole*. *Jos.*

WHOLE, *s.* The totality; no part omitted; the complex of all the parts.—Fear God, and keep his commandments, for this is the *whole* duty of man. *Ecclesiastes.*—A system; a regular combination.

Begin with sense, of every art the soul,
Parts answering parts, shall slide into a *whole*. *Pope.*

WHO'LESALE, *s.* Sale in the lump, not in separate small parcels.—The whole mass.—Some from vanity, or envy, despise a valuable book, and throw contempt upon it by *wholesale*. *Watts.*

WHO'LESALE, *adj.* Buying or selling in the lump, or in large quantities.—This cost me at the *wholesale* merchant's a hundred drachmas; I make two hundred by selling it in retail. *Addison.*

WHO'LESOME, *adj.* [*heelsam*, Dutch; *heylsam*, Teutonick; both from *hæl*, Saxon, *health*.] Sound. Contrary to unsound in doctrine.—So the doctrine contain'd be but *wholesome* and edifying, a want of exactness in speaking may be overlook'd. *Aitterbury.*—Contributing to health.

Night not now, as ere man fell,
Wholesome and cool and mild; but with black air
Accompany'd, with damps and dreadful gloom. *Milton.*

Preserving; salutary. *Obsolete.*—The Lord helpeth his anointed, and will hear him from his holy heaven; even with the *wholesome* strength of his right hand. *Psalms.*—Useful; conducive to happiness or virtue.—They suffer us to famish, repeal daily any *wholesome* act established against the rich, and provide more piercing statutes to chain up the poor. *Shakspeare.*—Kindly; pleasing. A burlesque use.—I cannot make you a *wholesome* answer; my wit's diseased. *Shakspeare.*

WHO'LESOMELY, *adv.* Salubriously; salutiferously.—He caused him to be more *wholesomely* kept, concerning his diet, than he was before. *Fox.*

WHO'LESOMENESS, *s.* Quality of conducing to health; salubrity.—At Tonon they shewed us a great fountain of water, that is in great esteem for its *wholesomeness*; weighing two ounces in a pound less than the same measure of the lake water. *Addison.*—Salutariness; conduciveness to good.—And now concerning the *wholesomeness* of discursing. *Goodman.*

WHO'LLY, *adv.* Completely; perfectly.—This story was written before Boccace; but its author being *wholly* lost, Chaucer is now become an original. *Dryden.*—Totally; in all the parts or kinds.

Nor *wholly* lost we so deserv'd a prey;
For storms repenting part of it restor'd. *Dryden.*

WHOM. The accusative of *who*, singular and plural.—There be men in the world, *whom* you had rather have your son be with five hundred pounds, than some other with five thousand. *Locke.*

WHOMSOE'VER, *pron.* [oblique case of *whosoever*.] Any without exception.—With *whomsoever* thou findest thy goods, let him not live. *Gen.*

WHOO'BUB, *s.* Hubbub. See **HUBBUB**.—In this time of lethargy, I pick'd and cut most of their festival purses: and had not the old man come in with a *whoobub* against his daughter, and scar'd my coughs from the chaff, I had not laid a purse in the whole army. *Shakspeare.*

WHOOOP, *s.* A shout of pursuit.
Let them breathe a-while, and then
Cry *whoop*, and set them on again, *Hudibras.*

[*Upupa*, Latin.] A bird. *Dict.*
To WHOOP, *v. n.* To shout.—One cries and shouts; another sings; *whoops*, and hallooes. *Burton.*

To WHOOP, *v. a.* To insult with shouts.
While he trusts me, 'twere so base a part
To fawn, and yet betray; I should be hiss'd
And *whoop'd* in hell for that ingratitude. *Dryden.*

To WHOOT, *v. n.* [See **To HOOT**.] To shout.—Satyrs—run *whooting* to the hills. *Drayton.*

To WHOOT, *v. a.* To insult with shouts.
The man, who shews his heart,
Is *whooted* for his nudities. *Young.*

WHORE, *s.* [hupe, Sax.; *hoere*, Dutch; *hore*, Dan.; *hora*, Su. Goth.; *hoera*, Icel.] A prostitute; a woman who receives men for money.

Orontes
Conveys his wealth to Tiber's hungry shores,
And fattens Italy with foreign *whores*. *Dryden.*

A woman who converses unlawfully with men; a fornicatress; an adulteress; a strumpet.
To put out the word *whore*, thou dost me woo,
Throughout my book; troth, put out woman too. *B. Jonson.*

To WHORE, *v. a.* To corrupt with regard to chastity.
Thou kept'st me brave at court, and *whor'd* me;
Then married me to a young noble gentleman,
And *whor'd* me still. *Beaum. and Fl.*

To WHORE, *v. n.* To converse unlawfully with the other sex.

'Tis a noble general's prudent part,
To cherish valour, and reward desert;
Let him be daub'd with lace, live high, and *whore*;
Sometimes be lousy; but be never poor.

Dryden.

WHOREDOM, *s.* Fornication.—Some let go *whoredom* as an indifferent matter, which yet strive for an holy-day, as for their life. *Bp. Hall.*

WHOREMASTER, or **WHOREMONGER**, *s.* One who keeps whores, or converses with a fornicatress.—What is a *whoremaster*, fool?—a fool in good clothes and something like thee. *Shakspeare.*—Art thou fully persuaded that no *whoremonger* nor adulterer shall have any inheritance in the kingdom of God? and dost thou continue to practise these vices? *Tillotson.*

WHORESON, *s.* A bastard. It is generally used in a ludicrous dislike.—*Whoreson*, mad compound of majesty, welcome. *Shakspeare.*

WHORISH, *adj.* Unchaste; incontinent.—By means of a *whorish* woman a man is brought to a piece of bread. *Prov.*

WHORISHLY, *adv.* Harlot like.

WHORISHNESS, *s.* Character of a whore.—I would fayne know how they could be chaste, brought up in *whorishness*. *Bale.*

WHORLTON, a township of England, in Durham; 4½ miles south-east of Barnard Castle.—2. A township in the North Riding of Yorkshire; 5 miles south-west of Stokesley. Population 510.

WHORLTON, EAST and WEST, adjoining hamlets of England, in Northumberland, near the Picts' Wall; 5 miles north-west of Newcastle-upon-Tyne.

WHORTLEBERRY, *s.* [heortþeþuan, Saxon; *vitis idæa*.] Bilberry. A plant. *Miller.*

WHOSE, *s.* Genitive of *who*.

Though I could

With barefac'd power sweep him from my sight,
And bid my will avouch it, yet I must not;
For certain friends that are both his and mine,
Whose loves I may not drop.

Shakspeare.

Genitive of *which*.

Those darts *whose* points make Gods adore
His might, and deprecate his power.

Prior.

WHO'SO, or **WHOSOE'VER**, *pronoun.* Any without restriction. *Whoso* is out of use.—*Whoso* is out of hope to attain to another's virtue, will seek to come at even hand, by depressing another's fortune. *Bacon.*—Let there be persons licensed to lend upon usury; let the rate be somewhat more easy for the merchant than that he formerly payed; for all borrowers shall have some ease, be he merchant or *whosoever*. *Bacon.*

TO WHUR, *v. n.* To pronounce the letter *r* with too much force. *Dict.*

WHURT, *s.* A whortleberry; a bilberry.—For fruits, both wild, as *whurts*, strawberries, pears, and plums, though the meaner sort come short, the gentlemen step not far behind those of other parts. *Carew.*

WHY, *adv.* [hpi, fophpi, Saxon.] For what reason? Interrogatively.—They both deal justly with you; *why*? not from any regard they have for justice, but because their fortune depends on their credit. *Swift.*—For which reason. Relatively.—In every sin, men must not consider the unlawfulness thereof only, but the reason *why* it should be unlawful. *Perkins.*—For what reason. Relatively.

I was dispatch'd for their defence and guard;
And listen *why*, for I will tell you now.

Milton.

You have not been a-bed then?

Why, no; the day had broke before we parted. *Shakspeare.*

WHY, *s.* [*quie*, Danish.] A young heifer; and a *why*-calf is a *cow*-calf. Used in the north of England. *Grose.*

WHYE, a town of Hindostan, province of Bejapore, now belonging to the British. It is situated near to the source of the river Krishna, and is one of the places of Hindoo pilgrimage. Lat. 18. N. long. 74. 5. E.

WHY-EA-TEA, a bay on the east coast of Owhyhee. Lat. 19. 44. N. long. 204. 54. E.

WHYKIN, a hamlet of England, in Leicestershire, near Hinckley.

WHYMEA BAY, a bay on the north coast of the island of Woahoo. At this port Mr. Hergest, commander, Mr. Gooch, astronomer, and a seaman of the *Dædalus*, going out with stores for captain Vancouver, were seized by some of the inhabitants, and killed, in 1792. Lat. 21. 38. N. long. 202. 51. E.

WHY'NOT, *adv.* A cant word for violent or peremptory procedure.

Capoch'd your rabbins of the synod,
And snap'd their canons with a *whynot*.

Hudibras.

WHYMEA ROAD, a road on the south-west coast of the island of Attowai. Captain Vancouver says this bay is much confined in respect to safe anchorage; for although the Discovery's cables had not been injured by a foul bottom; yet the Chatham, in March, 1792, when anchored in 30 fathoms water, at only a convenient distance to the north-west of the Discovery, on a bottom of soft mud, had both her cables much fretted and damaged by the rocks at the bottom; and not far to the eastward of our easternmost anchor was found also a patch of rocky bottom, in some places not deeper than four fathoms, though surrounded by a depth of from 30 to 40 fathoms.

WHYTATAKEE, an island in the South Pacific Ocean, discovered by Captain Blyth, in the Bounty. The inhabitants of both sexes wear no clothing, but a girdle of stained leaves round the middle, and the men an ornament of pearl oyster-shell, exactly resembling an officer's gorget. The centre is black, and the transparent part of the shell is left as an edge or border to it, which produces a very fine effect. It is hung round the neck by a band of human hair, or of the fibres of the cocoa-nut shell, with a rose neatly worked at each corner of the gorget. Their spears are nine feet long, and very neatly carved in alto relievo. Lat. 18. 52. S. long. 159. 41. W.

WHYTT (Robert), F. R. S., a distinguished physician, was born at Edinburgh in 1714, educated at St. Andrew's, and studied physic first at Edinburgh, and afterwards at London, Paris, and Leyden. He settled in his profession at Edinburgh, where he became a fellow, then president of the college of physicians, and in 1746 chairman of the institutions of medicine in the university. As a medical practitioner and teacher, and also as a writer, he acquired celebrity. The first of his publications was an "Essay on the Vital and other Involuntary Motions of Animals," 1751, in which he advances a theory different from that of Stahl, as he attributes these motions not to the soul, acting to a foreseen end, but to the power of stimulus. In 1755 he published "Physiological Essays, containing an Inquiry into the Causes which promote the Circulation of the Fluids in the very small Vessels of Animals; with Observations on the Sensibility and Irritability of the Parts of Man and other Animals." Here he supposes that the action of the heart is not sufficient to propel the blood through the minutest vessels, but that it is assisted by an oscillatory motion of the vessels themselves. Of this work, an enlarged edition appeared in 1761. His other works are, "An Essay on the Virtues of Lime-water in the Cure of the Stone," 1752; "Observations on the Nature, Cause, and Cure of those Disorders which are commonly called Nervous, Hypochondriac, and Hysterical," 1764; and some papers in the Edinburgh "Essays and Observations, Physical and Literary." A posthumous work appeared, entitled "Observations on the Dropsy of the Brain." Having long laboured under a complication of chronic complaints, he died in 1766. His son published an edition of all his works in 1768, 4to. under the inspection of sir John Pringle. *Haller Bib. Anat. Gen. Biog.*

WI, [Sax.] Holy. Thus *Wimund*, holy pease; *Wibert*, eminent for sanctity; *Alwi*, altogether holy, as Hierocles, Hieronymus, Hosius, &c. *Gibson's Camden.*

WIA, one of the small western islands of Scotland, a little to

to the south of Benbecula. Lat. 57. 22. N. long. 7. 11. W.—2. One of the small western islands, near the east coast of Barray. Lat. 56. 58. N. long. 7. 22. W.—3. A small island near the west coast of Skye. Lat. 57. 21. N. long. 6. 27. W.

WIAMIA, a river of Guiana, which rises near the shore of the river Marawini, runs south-south-east, and enters the sea between that river and the mouth of the river Surinam.

WIBDEN, a hamlet of England, in Gloucestershire, near Chepstow.

WIBSEY, a hamlet of England, West Riding of Yorkshire, near Bradford.

WIBTOFT, a hamlet of England, in Leicestershire; situated at the meeting of the two Roman military roads called Watling-street and Fosseway, where, according to tradition, was once a flourishing city of the Romans, called Clechester; 6 miles south-east of Hinckley.

WIC, *Wich*. Comes from the Saxon *wic*, which according to the different nature and condition of places, hath a threefold signification; implying either a village, or a bay made by the winding banks of a river, or a castle. *Gibson's Camden*.

WICHAMPTON, a parish of England, in Dorsetshire; 4 miles north-by-west of Wimborne Minster. Population 377.

WICHEHALGH, a township of England, in Cheshire; 5½ miles north-west of Whitchurch, Salop.

WICHEM, a village of the Netherlands, in the province of Gelderland, with 1700 inhabitants; 6 miles south-west of Nimeguen.

WICHENFORD, a parish of England, in Worcestershire; 6 miles north-west of Worcester. Population 398.

WICHLING, a parish of England, in Kent; 4½ miles north-by-west of Charing.

WICHNOR, a parish of England, in Staffordshire; 5½ miles north-east of Lichfield.

WICHTRACHT, UPPER and LOWER, two large villages of Switzerland, in the canton of Bern; 80 miles south-south-east of Bern.

WICK, *s.* [*wiecke*, Saxon; *wiecke*, Dutch.] The substance round which is applied the wax or tallow of a torch or candle.—Little atoms of oil or melted wax continually ascend apace up the *wick* of a burning candle. *Digby*.

WICK, a parish of Scotland, in the county of Caithness, extending about 20 miles in length, and 10 in breadth. Population 5080.

WICK, a royal burgh of Scotland, in the above parish, seated at the mouth of the river Wick. When the provost and bailies are elected, they have the right of nominating seven councillors, a treasurer, and dean of guild. The revenue of the town is small, but on the increase. Wick is the county town of the shire, and the county elections are held here. It is one of the northern districts of burghs, and, with Kirkwall, Dornoch, Dingwall, and Tain, sends a member to parliament; 20½ miles south of Thurso. It contains about 1000 inhabitants.

WICK, a river of Scotland, in the county of Caithness, which rises in the high grounds in the parish of Latheron. In its course, it is augmented by two streams; one from the loch of Toftingal, and the other from the loch of Wattin; and discharges itself into the sea at the town of Wick, where its estuary forms the harbour of that town. The salmon fishing on this river is very productive.

WICK, a township of England, in Gloucestershire; 9 miles from Tamworth. Population 671.—2. A hamlet in the parish of Curry Rivell, Somersetshire.—3. A hamlet in Worcestershire, near Pershore.—4. A township of Wales, in Glamorganshire; 6 miles from Cowbridge.—5. A small town of the Prussian states, and the island of Rugen, on a narrow bay; 15 miles north-north-west of Bergen.

WICK, BISHOP'S, a hamlet of England, in Suffolk, near Ipswich.

WICKED, *adj.* Given to vice; not good; flagitious; morally bad.

VOL. XXIV. No. 1662.

But since thy veins paternal virtue fires,
Go and succeed! the rival's aims despise;
For never, never *wicked* man was wise.

Pope.

It is a word of ludicrous or slight blame.—That same *wicked* bastard of Venus, that blind rascally boy, that abuses every one's eyes because his own are out, let him be judge how deep I am in love. *Shakspeare*.—Cursed; baneful; pernicious; bad in effect; as, medicinal things are called virtuous.

As *wicked* dew as e'er my mother brush'd,
With raven's feather from unwholesome fen,
Drop on you both.

Shakspeare.

WICKEDLY, *adv.* Criminally; corruptly; badly.

'Tis phrase absurd to call a villain great:
Who *wickedly* is wise, or madly brave,
Is but the more a fool, the more a knave.

Pope.

WICKEDNESS, *s.* Corruption of manners; guilt; moral ill.—It is not good that children should know any *wickedness*; old folks have discretion and know the world. *Shakspeare*.

WICKEN, or WYKES, a parish of England, in Cambridgeshire; 7 miles north-west of Newmarket. Population 595.

WICKEN, a parish of England, in Northamptonshire, near Stoney Stratford.

WICKEN BONHUNT, a parish of England, in Essex, near Saffron Walden.

WICKENBY, a parish of England, in Lincolnshire; 3½ miles north-west of Wragby.

WICKENRODE, a large village in the west of Germany, in Hesse-Cassel.

WICKER, *adj.* [*vigre*, Danish, a twig; from *viger*, to yield; or Teut. *wicken*, to shake; because of its pliant quality. *Dr. Jamieson*.] Made of small sticks.

Each one a little *wicker* basket had
Made of fine twigs, entrail'd curiously;
In which they gather'd flowers.

Spenser.

WICKERADE, a town of Prussian Westphalia; 14 miles north of Juliers, and 3 north-east of Erkelens. Population 1300.

WICKERSLACK, a hamlet of England, in Westmoreland, near Shap.

WICKERSLEY, a township of England, West Riding of Yorkshire; 4 miles east-by-south of Rotherham.

WICKES, or WYKES, a parish of England, in Essex; 4 miles south-east of Manningtree. Population 675.

WICKET, *s.* [*guichet*, Fr.; *wicket*, Dutch; *gwichet*, Welch, from *gwich*, stridor. *Serenius*.] A small gate.—The chaffering with dissenters, and dodging about this or the other ceremony, is like opening a few *wickets*, by which no more than one can get in at a time. *Swift*.—A pair of short laths, set up within a few inches of each other, to be bowled at in the game of cricket. *Mason*.—Full fast the Kentish *wickets* fell. *Duncombe*.

WICKFORD, a parish of England, in Essex; 6 miles east-by-south of Billericay.

WICKFORD, a post village of the United States, in North Kingston, Rhode island, on Narraganset bay; 9 miles north-west of Newport.

WICKHAM, a parish of England, in Berkshire; 5½ miles north-west of Speenhamland.—2. A parish in Southamptonshire; 3½ miles south-by-east of Bishop's Waltham. It is noted as the birth-place of William of Wickham, in the reign of Edward II. Fair on the 20th May. Population 978.

WICKHAM, BISHOP'S, a parish of England, in Essex, near Waltham.

WICKHAM-BREAUX, a parish of England, in Kent; 4½ miles east of Canterbury. Population 430.

WICKHAM, BROOK, a parish of England, in Suffolk; 6 miles north-by-west of Clare. Population 1160.

WICKHAM, CHILD'S, a parish of England, in Gloucestershire; $5\frac{1}{2}$ miles west-by-south of Chipping Campden.

WICKHAM, EAST, a parish of England, in Kent; $3\frac{1}{2}$ miles west-by-north of Crayford.

WICKHAM MARKET, a village and parish of England, in the county of Suffolk, situated on the river Devon. It was formerly a market town. It is now a thoroughfare on the road from Woodbridge to Yarmouth, and contains several good inns. Population 906.

WICKHAM, ST. PAUL, a parish of England, in Essex; 3 miles east-by-north of Castle Hedingham.

WICKHAM SKEITH, a parish of England, in Suffolk; 5 miles south-west of Eye. Population 516.

WICKHAM, WEST, a parish of England, in Cambridgeshire; 5 miles north-east of Linton.

WICKHAMFORD, a parish of England, in Worcestershire; 2 miles south-east of Evesham.

WICKHAMPTON, a parish of England, in Norfolk; 4 miles south-south-east of Acle.

WICKLEWOOD, a parish of England, in Norfolk; 3 miles west-by-north of Wymondham. Population 534.

WICKLIFFISTS, or WICKLIFFITES, a religious sect, who had their rise in England in the 14th century, and their name from their leader, John Wickliffe.

Wickliffe, of whose opinions we give some account in his biographical article, (see WICKLIFF,) denied that bishops were of a different order from priests, and that by virtue of their office they had any power to do what priests have not; and that in the apostolic times the two orders subsisting in the church were those of priest and deacon. With regard to tithes, he observes, that we do not read in the Gospel where Christ paid tithes, or commanded any man so to do; and that if they were due by God's commandment, there should be every where in Christendom one manner of tithing; and that those things which are due to priests should be given freely, without exaction or constraining. In opposition to the papal claims of supremacy and dominion, he maintained that the grants of emperors may be resumed; that St. Peter and his successors have no rights conferred upon them of civil or political dominion; that the persons of the clergy and the goods of the church are not exempted from the civil powers; and that bulls of absolution or excommunication are conditional and not absolute, and depend for their effects on the disposition and character of those to whom they pertain.

WICKLOW, a county of Ireland, in the province of Leinster, bounded on the north by Dublin, on the east by the Irish sea, on the south by Wexford, and on the west by Kildare and Carlow; about 32 miles from north to south, and from 15 to 26 in breadth, from east to west. It contains 58 parishes, about 11,550 houses, and 58,000 inhabitants. Great part of this county is mountainous, with a mixture of rocks and bogs, so as to be ill-adapted for cultivation. It is well wooded, and some of the vallies are fertile. The rivers Liffey and Slaney, with some others, have their sources in this county. Only two members are returned to the imperial parliament by the county.—2. A seaport town of Ireland, in the county of that name, on a small harbour in the Irish sea. It is boldly situated on the declivity of a lofty mountain, commanding an extensive prospect of Brayhead, and all the intervening flat country lying in that direction. The Black Castle is a huge rock, rising perpendicularly from the sea, on whose platform a castle seems to have been constructed, as appears from the few remaining fragments of the ruins still existing. A channel deeply cut into the solid rock, over which the draw-bridge was thrown, is still visible, and likewise steps chiseled down its side, to communicate with the sea. This was a borough town previous to the union, and sent two members to the Irish parliament; 41 miles north of Wexford, and 22 south of Dublin. Lat. 52. 59. N. long. 6. 3. W.

WICKMERE, a parish of England, in Norfolk; 5 miles north-north-west of Aylesham.

WICKTON, a parish of England, in Herefordshire; $4\frac{1}{2}$ miles south-east of Leominster.

WICKWA, a small lake of Canada, at the eastern extremity of Lake St. John.

WICKWARE, a market town of England, in the county of Gloucester, situated on two small streams, over one of which it has a handsome stone bridge. The church is a spacious building, having two aisles, with a lofty tower at the west end, ornamented with pinnacles. Here is a good free school, endowed by one Alexander Hosea, a native of the place. Wickware is a very ancient corporation, governed by a mayor and an indefinite number of aldermen. Of late years the town is much decayed, and at present is without any trade. A trifling market on Monday, and two annual fairs; 17 miles north-east of Bristol, and 111 west of London. Population 805.

WICKWICK, a small hamlet of England, in Gloucestershire, near Chipping Sodbury.

WICKLIFF, DE WYCLIF, or WICKLIFFE (John), the earliest reformer of religion from Popery, was born about the year 1324 in Yorkshire, near the river Tees, in a parish whence he takes his name. He was educated at Oxford, first as a commoner of Queen's college, and then at Merton college, peculiarly celebrated at that period for its learned members. His industry and talents soon raised him to distinction; and he is said to have committed to memory the most abstruse parts of Aristotle, and to have excelled in his acquaintance with the subtleties of the school divinity. He was also eminently skilled in civil and canon law, and in the law of the land. But the study which led to his future fame was that of the Scriptures; to which he added a diligent perusal of the Latin fathers, and of the writings of the English divines, Robert Groshead and Richard Fitz-Ralph. In his treatise "Of the Last Age of the Church," at the early period of the year 1356, he remonstrated against some Popish corruptions; and in 1360 he was active in opposing the encroachments of the Mendicant Friars, who interfered with the jurisdiction and statutes of the university, and took all opportunities of enticing the students from the colleges into their convents. In the following year, such was the credit he had acquired by his conduct and writings, he was appointed master of Baliol college, and was presented to a living in Lincolnshire. At this time he was held in such esteem by archbishop Simon Islip, that in 1365 he constituted him warden of Canterbury college, which he had just founded; but on occasion of a dispute between the regular and secular priests, Wickliffe and the three secular fellows were rejected; and on an appeal to Rome, the sentence against Wickliffe was confirmed in 1370. His reputation in the university was not at all diminished by his exclusion. In 1372 he took the degree of D.D., and read lectures, which gained him such applause, that whatever he said was regarded as an oracle. The impostures of the monks were the objects to which his first attacks were particularly directed; and the circumstances of the times favoured his design. The court of Rome was now enforcing by menaces its demands on king Edward III. of the homage and tribute to the see of Rome, which had been ingloriously stipulated by king John; and the parliament had determined to support the king in his refusal. A monk appeared as an advocate on behalf of the claims of Rome; and Wickliffe's reply caused him to be favourably regarded at court, and procured for him the patronage of the king's son, John of Gaunt, duke of Lancaster. In 1374 Wickliffe was joined in an embassy to Bruges, the object of which was to confer with the papal nuncios concerning the liberties of the English church, on which the usurpations of Rome had made unwarrantable encroachments. In the same year the king presented him to the valuable rectory of Lutterworth, in Leicestershire; and in the following year he was installed in a prebend of the collegiate church of Westbury, in Gloucestershire. Wickliffe, by his foreign mission, had an opportunity of acquainting himself with the corruption and tyranny of the court of Rome; and both his lectures and conversations were amplified with invectives against the pope. Whilst he defended the authority of the crown and the privileges of the nobles against all ecclesiastical encroachments, he censured vice and corruption

corruption in all ranks of society. This conduct, though it raised his reputation among the people, excited a host of enemies, who selected from his writings nineteen articles; which they deemed heretical, and which, as such, they transmitted to Gregory XI. In 1377 this pontiff returned three bulls addressed to the archbishop of Canterbury and the bishop of London, ordering the seizure and imprisonment of Wickliffe; or, if this measure failed, his citation to the court of Rome; and also a requisition to the king and government to assist in extirpating the errors which he had propagated. Edward died before the bulls arrived; and the duke of Lancaster, uncle to the young king, had great influence in the administration. When Wickliffe, therefore, was cited to appear at St. Paul's church before the two prelates, possessing plenitude of power, he thought it necessary to secure himself by the protection of that powerful patron. On the appointed day he appeared at St. Paul's, in the midst of a vast concourse of people, and accompanied by the duke of Lancaster, and lord Henry Percy, earl-marshal. The bishop of London was very indignant, and angry words passed between him and the two lords; so that the whole assembly was tumultuous, and nothing was done. Wickliffe afterwards appeared before the two prelates in Lambeth palace, and delivered an explanation of the articles objected against him. The Londoners, who were apprehensive that he might be severely treated, flocked in crowds to the palace, and a messenger from the queen forbade the delegates to proceed to a definitive sentence. Gregory soon after died, and his commission expiring with him, Wickliffe escaped, but not without a severe illness, which was the consequence of his anxiety and fatigue. His spirits, however, were unbroken, and he was firm in maintaining opinions which the friars, by all the efforts of intimidation, urged him to renounce.

Upon his recovery, he presented to the parliament, in 1379, a paper against the tyranny and usurpations of Rome; and he also drew up some free remarks on the papal supremacy and infallibility. But his most effectual attack on the corruption of religion was his translation of the Bible into English. This occupied many of the last years of his life, and remains a valuable relic of the age in which it was performed, and a permanent memorial of the talents and industry of the person by whom it was accomplished. By way of preparation for his Bible, he published a treatise "Of the Truth of the Scripture," in which, as well as in a prologue or preface to his translation, he held, long before any of our other reformers or advocates for the sufficiency of Scripture, that this is the law of Christ, and the faith of the church; that all truth is contained in it; and that every disputation which has not its origin thence is profane. "The truth of the faith," says he, "shines the more by how much the more it is known—nor are those heretics to be heard who fancy that seculars ought not to know the law of God, but that it is sufficient for them to know what priests and prelates tell them by word of mouth; for the Scripture is the faith of the church, and the more it is known in an orthodox sense the better; therefore, as secular men ought to know the faith, so it is to be taught men in whatsoever language is best known to them. Besides, since the truth of the faith is clearer and more exact in the Scripture than the priests know how to express it—it seems useful that the faithful should themselves search out and discover the sense of the faith, by having the Scriptures in a language which they understand.—The laws which the prelates make are not to be received as matters of faith; nor are we to believe their words or discourses any farther or otherwise than they are founded on the Scripture;"—with much more to the same purpose, and in the same admirable strain. In this preface, and several other publications and treatises still in manuscript, he reflected severely on the corruptions of the clergy, condemned the worship of saints and images, the doctrine of indulgences, pilgrimages to particular shrines, and confession; and also denied the corporal presence of Christ in the sacrament, inveighed against the wanton exercise of the papal power, and opposed the making of the belief of the pope's being head of the church an article of faith and salvation, censured the celibacy

of the clergy, forced vows of chastity, exposed various errors and irregularities in the hierarchy and discipline of the church, and earnestly exhorted all people to the study of the Scriptures.

In his lectures of 1381 he attacked the Popish doctrine of transubstantiation, concerning which he laid down this fundamental proposition; viz. that the substance of bread and wine still remained in the sacramental elements after their consecration, and that the host is only typically to be regarded as the body of Christ; and he deduced from it sixteen conclusions. This attack alarmed the church, which regarded transubstantiation as the most sacred tenet of the Romish religion, and the chancellor of Oxford pronounced a condemnation of these conclusions. Wickliffe appealed from this sentence to the king; but he found himself deserted by his protector, the duke of Lancaster, who had no further occasion for his services, or who could not avail himself for any political purpose of his theological discussions. Thus circumstanced, he found himself in danger; his resolution failed him, and he humbled himself by making a confession at Oxford, before the archbishop and six bishops, with other clergy, who had already condemned some of his tenets as erroneous and heretical. In this confession, he admitted the real presence of Christ's body in the sacrament, with some explanations and reasons which were not satisfactory to his persecutors. It has been said that he made a public recantation of the opinions with which he was charged; but of this no sufficient evidence appears. The next step in their proceedings against him was a royal letter, procured by the archbishop, addressed to the chancellor and proctors, and directing them to expel from the university and town of Oxford all who should harbour Wickliffe or his followers, or hold any communication with them. These proceedings obliged him to withdraw, and to retire to his rectory at Lutterworth, where he continued to preach reformation in religion, and finished his translation of the Scriptures. Some have said that king Richard banished him out of England; but if that were the case, it was only a temporary exile, and he returned in safety to Lutterworth. In 1383 he had a paralytic stroke, which furnished him with an apology for not appearing to a citation of pope Urban VI.; and this was succeeded by a second attack, which terminated his life on the last day of December, 1384. His remains, however, did not escape the vengeance of his enemies many years after his death; for the council of Constance in 1415, not content with condemning many propositions in his works, and declaring that he died an obstinate heretic, with impotent malignity ordered his bones to be dug up and thrown upon a dunghill. This sentence was executed in 1428, in consequence of a mandate from the pope, by Flemming, bishop of Lincoln, who caused his remains to be disinterred and burnt, and the ashes to be thrown into a brook. "Thus," says Fuller, the church historian, in a figurative strain justified by fact, "this brook hath conveyed his ashes into Avon, Avon into Severn, Severn into the narrow seas, they into the main ocean; and thus the ashes of Wickliffe are the emblem of his doctrine, which now is dispersed all the world over." His doctrine not only survived these impotent attempts to extinguish it, but was perpetuated and diffused by his followers, who were called Lollards; and "this germ of reformation," as one of his biographers says, "broke forth into complete expansion, when the season for that great change was fully come." Of his general character, it will be sufficient to say, "that he was confessedly learned for his age, and was an acute reasoner. In short, notwithstanding certain errors and imperfections, he may be regarded as a person of extraordinary merit and qualifications, who is entitled to honourable remembrance from every foe to ecclesiastical tyranny and imposture;" and we may add that he advanced principles which have not yet produced their full effect.

The number of tracts he wrote and published, both in Latin and English, is very considerable. From two large volumes of his works, entitled "Aletheia, i. e. Truth," and a third under the title of "Trialogus," John Huss is said to have

have derived most of his doctrines. We have a full and complete "History of the Life and Sufferings, and various Writings of Wickliffe," both printed and MS., published in 8vo., at London, in the year 1720, by Mr. John Lewis, who also published, in 1731, "Wickliffe's English Translation of the New Testament from the Latin Version, called the Vulgate." This translation is enriched with a learned preface by the editor, in which he enlarges upon the life, actions, and sufferings of this eminent reformer.—*Biog. Brit. Mosh. Eccl. Hist. Neal's Hist. of the Puritans. Gen. Biog.*

WICLIFFITE, *s.* One of the followers of the great religious reformer Wickliffe.—If two persons were met travelling on the road, it was much if one of them was not a *Wickliffite*. *Lewis.*

WICOMICICO, a river of the United States, in Maryland, which rises in Delaware, and falls into the Chesapeake, south of the Nanticoke.

WICOMICICO CHURCH, a post village of the United States, in Northumberland county, Virginia.

WICQUEFORT (Abraham), was born at Amsterdam in 1598, and having left his own country for France at an early age, he was nominated resident for the elector of Brandenburg at the French court, and held the office for thirty-two years. But being suspected by cardinal Mazarin of communicating secrets to his correspondents in Holland with regard to the amours of Lewis XIV., he was ordered, in 1658, to leave the kingdom; but in the mean time he was arrested, and confined in the Bastille. At length, in 1659, he was released and dismissed. However, in three months the cardinal recalled him, and settled on him a pension. On occasion of the war between France and Holland in 1672, he returned to his own country, and was protected by John de Witt, who employed him in writing a history of Holland to his own time. In 1676 he was arrested, and condemned to perpetual imprisonment, under an accusation of carrying on a secret correspondence with the enemies of the state; and after having been confined for three years, he made his escape by the contrivance of one of his daughters. He then sought refuge at the court of Zell, from which he returned to Holland in 1681, where he lived without molestation, but without recovering the places of which he had been deprived. In the following year, 1682, he died. The work on account of which Wicquefort is best known, is entitled "L'Ambassadeur et ses Fonctions," first printed at the Hague in 2 vols. 4to. 1681, and often reprinted. He holds in high estimation the privileges of the order to which he belonged, as we may infer from his censure of Cromwell's spirited act of justice in executing the brother of the Portuguese ambassador for a murder: nevertheless he inculcates sound morality with regard to the conduct of diplomatists in the countries to which they are sent. His other works are, "Mémoires touchant les Ambassadeurs et les Ministres;" one volume of his "History of the Dutch Republic," which appeared in French at the Hague in 1719, fol.; and translations into French of the accounts of different embassies, and also of voyages and travels.—*Moreri. Gen. Biog.*

WIDAWA, a town of Poland; 43 miles south east of Kalisch, with 900 inhabitants.

WIDCOMBE, a parish of England, in Somersetshire; 1½ mile south-east of Bath.

WIDDECOMBE IN THE MOOR, a parish of England, in Devonshire; 5½ miles north-west of Ashburton. Population 1151.

WIDDERN, a town of Germany, on the river Jaxt, with 1000 inhabitants.

WIDDIAL, a parish of England, in Hertfordshire; 6 miles from Royston.

WIDDIN. See *Vidin*.

WIDDINGTON, a parish of England, in Essex; 5 miles west-by-north of Thaxted.—2. A parish in the West Riding of Yorkshire; 8 miles south-east of Aldborough.

WIDDY. See *Witny*.

WIDE. *adj.* [*wide*, Saxon; *wijd*, Dutch.] Broad; extended far each way.

He wand'ring long a *wider* circle made,
And many-linguag'd nations he survey'd. *Pope.*

Broad to a certain degree: as, three inches *wide*.—Deviating; remote.—Many of the fathers were far *wide* from the understanding of this place. *Raleigh.*

WIDE, *adv.* At a distance. In this sense *wide* seems to be sometimes an adverb.—The Chinese, a people whose way of thinking seems to lie as *wide* of ours in Europe as their country does. *Temple*.—With great extent.

Of all these bounds enrich'd
With plenteous rivers, and *wide* skirted meads,
We make thee lady. *Shakspeare.*

WIDE BAY, a bay on the east coast of New Holland, between Double Island point and Indian Head.

WIDEHOPE, or **WITHUP**, a district of England, in the county of Cumberland, in Lorton parish; an extensive, mountainous, and woody tract, with several small hamlets, scattered about in different parts of it.

WIDEKINDI, or **WIDICHINDI** (John), a Swedish historian, was born in the province of Westmanland, about the year 1620, and studied at Upsal, where he delivered an oration in 1654, on occasion of queen Christina's accession to the throne; and by her recommendation he was appointed historiographer of the kingdom. In 1666 he proposed printing his "History of Gustavus Adolphus," and measures were taken for this purpose; but he died at Stockholm in 1671, before the work was executed. He possessed an excellent library, and was much respected by king Charles Gustavus, who called him his philosopher. The most important of his works, a catalogue of which is given in "Schefferi Svecia Litterata," is the "History of the Russian War," written both in Latin and Swedish, 1672, 4to. *Gen. Biog.*

WIDELY, *adv.* With great extent each way.—Any that considers how immense the intervals of the chaos are, in proportion to the bulk of the atoms, will hardly induce himself to believe, that particles so *widely* disseminated could ever throng one another to a compact texture. *Bentley*.—Remotely; far.—Let him exercise the freedom of his reason, and his mind will be strengthened, and the light which the remote parts of truth will give to one another, will so assist his judgment, that he will seldom be *widely* out. *Locke.*

To **WIDEN**, *v. a.* To make wide; to extend.

So now the gates are open; now prove good seconds;
'Tis for the followers, fortune *widens* them,
Not for the flyers. *Shakspeare.*

To **WIDEN**, *v. n.* To grow wide; to extend itself.

With her the temple ev'ry moment grew,
Upward the columns shoot, the roofs ascend,
And arches *widen*, and long isles extend. *Pope.*

WIDEN, a small town of Hungary, on the lake of Neusiedel; 29 miles south-south-east of Vienna.

WIDENESS, *s.* Breadth; large extent each way.

The rugged hair began to fall away;
The sweetness of her eyes did only stay,
Though not so large; her crooked horns decrease;
The *wideness* of her jaws and nostrils cease. *Dryden.*

Comparative breadth.—Within the same annual time, the centre of the earth is carried above fifty times as far round the orbis magnus, whose *wideness* we now assume to be 20,000 terrestrial diameters. *Bentley.*

WIDFORD, a parish of England, in the county of Gloucester; 2 miles east of Burford, in Oxfordshire.

WIDFORD, a parish of England, in Essex; 1½ mile south-west of Chelmsford.—2. A parish in Hertfordshire, on the little river Ash; 3½ miles east-by-north of Ware. Population 427.

WIDGEOON, *s.* [Serenius notices the Icel. *ugda*, *ygda*, certain birds named in the Edda.] A water-fowl not unlike a wild duck, but not so large.—Among the first sort we reckon creysers, curlews, and *widgeon*. *Carew.*

WIDLEY, a parish of England, in Southamptonshire, near Fareham.

WIDMER,

WIDMER, a hamlet of England, in the parish of Great Marlow, Buckinghamshire.

WIDMER-POOL, a parish of England, in Nottinghamshire; 9 miles south-south-east of Nottingham.

WIDNESS, a township of England, in Lancashire; 16 miles west-by-south of Warrington.

WIDNEY, a hamlet of England, in the parish of Donatt, Somersetshire.

WIDOW, *s.* [wiðpa, Saxon; *weduwe*, Dutch; *weddw*, Welsh; *vidua*, Lat.] A woman whose husband is dead.

To take the *widow*,

Exasperates, makes mad her sister Goneril. *Shakspeare.*

To WIDOW, *v. a.* To deprive of a husband.

In this city he

Hath *widow'd* and unchilded many a one,
Which to this hour bewail the injury. *Shakspeare.*

To endow with a widow-right.

For his possessions,

Although by confiscation they are ours,
We do instate and *widow* you withal,
To buy you a better husband. *Shakspeare.*

To strip of any thing good.

The *widow'd* isle in mourning
Dries up her tears. *Dryden.*

WIDOWER, *s.* One who has lost his wife.

The main consents are had, and here we'll stay
To see our *widower's* second marriage-day. *Shakspeare.*

WIDOWHOOD, *s.* The state of a widow.

Cherish thy hasten'd *widowhood* with the gold
Of matrimonial treason: so farewell. *Milton.*

Estate settled on a widow. *Not in use.*

For that dow'ry, I'll assure her of
Her *widowhood*, be it that she survives me,
In all my lands. *Shakspeare.*

WIDOWHU'NTER, *s.* One who courts widows for a jointure.—The *widowhunters* about town often afford them great diversion. *Addison.*

WIDOWMAKER, *s.* One who deprives women of their husbands.

It grieves my soul

That I must draw this metal from my side
To be a *widowmaker*. *Shakspeare.*

WIDOW-WAIL, *s.* A plant. *Miller.*

WIDRINGTON, a hamlet of England, in Northumberland; 8 miles north-east of Morpeth. Population 370.

WIDTH, *s.* Breadth; wideness. *A low word.*

Let thy vines in intervals be set,
Indulge their *width*, and add a roomy space,
That their extremest lines may scarce embrace. *Dryden.*

WIDWORTHY, a parish of England, in Devonshire; 3½ miles east-by-south of Honiton.

WIE, a river of Brazil, in the province of Sergippe, which falls into the Lixmai.

WIED, a small district, with the title of duchy, in the west of Germany, subject partly to Prussia, and partly to Nassau. It extends along the right bank of the Rhine, is traversed by the small river Wied, has an area of 170 square miles, and a population of 24,000, who are mostly Catholics.

WIEDA, a village of Germany, in the Duchy of Brunswick, on a small river of the same name. Population 1200.

WIEDENBRUCK, a town of Prussian Westphalia, on the Ems; 32 miles east-south-east of Osnabruck. Population 1800.

WIEDIKON, a village of Switzerland, west of the town of Zurich, on the river Sil.

WIEGSTADTL, a town of Austrian Silesia; 28 miles north-east of Olmutz. Population 1300.

WIEHE, a town of Prussian Saxony; 26 miles north-east of Erfurt. Population 1100.

VOL. XXIV. No. 1663.

WIEHL, a village of Germany, in Baden. Population 1100.

WIELAND (Christopher Martin), was the son of a Protestant clergyman at Biberach, in Swabia, where he was born in September, 1733. Educated by his father, he began at the early age of thirteen to distinguish himself by his Latin and German poems; and he pursued his education at Magdeburg and at Erfurt. Upon his return home he became affectionately attached to Sophia de Guterman, afterwards known by her works under the name of Mad. de la Roche. In the year 1750 he studied jurisprudence at Tubingen; but his time was chiefly devoted to the writing of verses, so that, in 1752, he published a didactic poem in six cantos, entitled "The Nature of Things;" "Ante-Ovid, or the Art of Love;" and "Moral Letters and Tales." He also began an epic poem, on the subject of Arminius, the first five cantos of which he sent to the famous Swiss poet Bodmer; and he was thus led to visit Switzerland, and to cultivate a friendship with this celebrated poet, and to reside for some time in his house at Zurich. In this retired and tranquil situation, he applied with great diligence to the study of the belles lettres, and acquainted himself with the principal modern languages, such as English, French, and Italian, to which he afterwards added the Spanish and Portuguese. He also read Plato with great attention, and wrote several works, among which were the "Trial of Abraham," and "Letters of the Dead." After a residence of seven or eight years in Switzerland, he quitted the country, having formed his taste on the models of Euripides, Xenophon, and Shaftsbury, whose writings he had diligently studied; and in 1758 he published his "Araspes and Panthea," a work which manifests the ascendancy which judgment and moral sentiment had acquired over his imagination. Upon his return in 1760 to his native city, he was appointed a director of the chancery, which office he held till the year 1769, reserving, however, some leisure moments for the composition of his philosophical romance, entitled "Agathon," and his beautiful didactic poem "Musarion." About this time he became intimately acquainted with Count Stadion, a nobleman who lived with splendour near Biberach, who had cultivated a taste for literature, and who possessed an excellent library. Wieland married his favourite daughter Charlotte to a bookseller at Zurich, who was a son of the celebrated poet, Solomon Gesner. In 1797 he visited his children at Zurich, and resided with his family in a romantic situation on the border of the lake, where he was visited by the most eminent literati of Switzerland. To the ex-monk Reinhold, who had escaped from Vienna, he was a generous patron, and gave to him one of his daughters in marriage. This monk was afterwards professor of philosophy at Kiel. He also supported another monk, who had fled to him from a Cistercian monastery in Swabia, during his residence at Jena, where he studied philosophy. Wieland had married in 1765 a person of good family at Augsburg, of whom he expresses himself in the highest terms of respect and affection, and by whom he had thirteen children; "sound," he says, "in body and mind; with their mother, they form the happiness of my life." In 1807 this venerable poet was elected a member of the floral order at Nuremberg; and in 1808, Buonaparte sent him the cross of the legion of honour. After the battle of Jena, he was protected by a special order of that conqueror. He died in January, 1813, in his 80th year. For the delineation of his talents and character by Küttner and others, and an account of his works, which were very numerous, we must refer to his article in the General Biography, observing that his original works have been published in thirty-six large 4to. volumes, and six supplementary volumes. *Leipsic*, 1794—1802.

To WIELD, *v. a.* [wealdan, Saxon, *to manage in the hand*.] To use with full command, as a thing not too heavy for the holder.

His looks are full of peaceful majesty,
His head by nature fram'd to wear a crown,
His hand to *wield* a sceptre, and himself
Likely in time to bless a regal throne. *Shakspeare.*

To handle; *in an ironical sense*.—Base Hungarian wight, wilt thou the spigot *wield*. *Shakspeare*.

WIE'LDLESS, *adj.* Unmanageable.

That with the weight of his own *wieldlesse* might
He falleth nigh to ground, and scarce recovereth flight.

Spenser.

WIE'LDY, *adj.* Manageable. *Dr. Johnson*.—Chaucer has once used it in the sense of *active*.

WIELICZKA, a town of Austrian Poland, in Galicia, circle of Bochnia. It is the seat of a salt and a mine office, and is remarkable for its large and productive salt mines. They are divided into three parts, and extend not only under the whole town, but to a considerable distance on each side, viz. 700 yards from north to south, and 2000 from east to west. They have ten entrances, and in one of these is a winding staircase of 470 steps. On entering the subterranean regions, the stranger is struck with the magnitude and beauty of the vaulted passages: he sees chapels, with altars, cut out of the saline rock, with crucifixes or images, and lamps continually burning before them. In another part he observes vast chambers, which serve as store-houses for the casks of salt, or for the forage of the horses which are employed in dragging loads of salt from the edges of the mine to the centre; 7 miles south-east of Cracow. Population 2200.

WIELONA, a small town of Russian Lithuania, in the government of Wilna, on the Niemen; 20 miles south of Rosienne.

WIELUN, a town of Prussian Poland; 65 miles east of Breslau. Population 2000.

WIENER HERBERG, a village of Lower Austria; 2 miles south-east of Vienna.

WIENERWALD (Forest of Vienna), a large forest of Lower Austria, extending from the Kahlenberg southward, to beyond Kaumberg. It separates and gives name to the two circles of the Upper and Lower Wienerwald, otherwise called the quarters above and below the forest of Vienna. The latter contains 1730 square miles, and 463,000 inhabitants, including Vienna. The circle above the Wienerwald contains 2000 square miles, and about 200,000 inhabitants. Its chief town is St. Polten.

WIEPRZ, a river of Poland, which joins the Vistula, near Stericza.

WIER (John), a physician, was born in 1515, at Grave on the Meuse; and being domesticated with the famous Cornelius Agrippa, adopted his opinions with regard to the occult sciences. After having studied at Paris and Orleans, he took the degree of M.D. about the year 1534. In the course of his travels he visited the court of the duke of Cleves, and was appointed his physician. He died at Tecklenburg, in Westphalia, in 1586. He was a man of considerable learning; and though participating in a great degree the credulity of the age, he incurred the enmity of the monks, by ascribing the sorcery, witchcraft, and magical practices, which they supported, to the operation of natural causes. The turn of his mind is discernible in his book "De Dæmonum Prestigiis et Incantationibus." In his treatise of medical observations he has given an account of the putrid sore throat, under the name of "Angina pestilentialis." Among his other writings are enumerated "De Iræ Morbo, et ejus Curatione Medica et Philosophica;" "Tractatus de Commentitiis Jëjuniis;" "De Tussi Epidemica, Anno 1580;" "De Varenis, Morbo endemio Westphalorum."—*Haller. Eloy.*

WIERINGEN, a small island of the Netherlands, in the Zuyder Zee, opposite to the coast of North Holland; 6 miles long, and 2 broad. Population about 1500.

WIERUM, a small seaport of the Netherlands, in Friesland; 6 miles north of Dokkum.

WIERUSZOW, a town of Poland, on the Proсна; 31 miles south of Kalisch. Population 1000.

WI'ERY, *adj.* Made of wire. *It were better written wiry*.

Your gown going off, such beauteous state reveals,
As when through flow'ry meads th' hill's shadow steals;

Off with that *wiery* coronet, and shew
The hairy diadem which on your head doth grow. *Donne*.

Drawn into wire.—Polymnia shall be drawn with her hair hanging loose about her shoulders, resembling *wiery* gold. *Peacham*. [From *wæp*, a pool.] Wet; wearish; moist. *Obsolete*.

Where but by chance a silver drop hath fall'n,
Ev'n to that drop ten thousand *wiery* friends
Do glew themselves in sociable grief.

Shakspeare.

WIESE, or LAUKA, a town of the Austrian states, in Moravia, on the river Iglau, with 800 inhabitants; 6 miles east of Iglau.

WIESECK, a village of Germany, in Hesse-Darmstadt. It has 1000 inhabitants.

WIESELBURG, or MOSONY, a small county of Hungary, bounded on the north by the Danube, and on the west by Lower Austria. Its area is about 740 square miles; its population 54,000, a mixture of Germans and Croats.

WIESELBURG, or MOSONY, the chief town of the above palatinate, is situated on a branch of the Danube; 21 miles south-south-east of Presburg. Lat. 47. 51. 3. N. long. 17. 15. 10. E. Population 2500.

WIESEN, CIRCLE OF THE, a district of the grand duchy of Baden, of which it forms the south-west corner, being bounded both on the south and west by the Rhine. It contains the south part of the Brisgau, and the whole district of Sausenburg, and has about 117,000 inhabitants. It is divided into 11 bailiwics.

WIESEN, a small river of Germany, which rises in the Black forest, and falls into the Rhine, opposite to Huningen.

WIESENBRONN, a small town of Germany, in Bavarian Franconia.

WIESENSTEIG, a town of Germany, in Wirtemberg; 18 miles north-west of Ulm. Population 1200.

WIESENT, a river of Bavaria, which falls into the Regnitz, at Forchheim.

WIESENTHAL, a village of Germany, in Baden; 4 miles east of Philippsburg. Population 900.

WIESENTHAL, UPPER, a town of Germany, in Saxony; 12 miles south-south-east of Schwarzenburg. Population 1500.—Lower Wiesenthal is a petty village near it.

WEISENTHEID, a town of Bavarian Franconia; 19 miles east of Wurzburg. Population 900.

WIESLOCH, a town of Germany, in Baden; 8 miles south of Heidelberg. Population 1900.

WIETHEN, a village of North America, Lat. 62. 30. N. long. 99. 50. W.

WIETLISBACH, a small town of Switzerland, in the canton of Bern; 6 miles east-north-east of Soleure.

WIETMARSEN, a large village of Hanover; 4 miles north of Northorn.

WIFE, *s.* Plural *wives*. [*wif*, Sax.; *wif*, Dutch; *wyf*, Icel. *mulier*; sic dicta à *wæfwa*, texere: *Kona kalldest wyf af wæfnandi*, *mulier adpellatur wyf à texendo*: *Edda. Serenius*.] A woman that has a husband.

There's no bottom, none

In my voluptuousness: your *wives*, your daughters,
Your matrons, and your maids could not fill up
The cistern of my lust.

Shakspeare.

It is used for a woman of low employment.

Strawberry *wives* lay two or three great strawberries at the mouth of their pot, and all the rest are little ones. *Bacon*.

WIFEHOOD, *s.* State and character of a wife.

She had neither manners, honesty, behaviour,
Wifehood, nor womanhood.

Beaum. and Fl.

WIFELESS, *adj.* Without a wife; unmarried. *Promt. Parv.*—And sixty yeres a *wifeless* man was he. *Chaucer*.

WIFELY, *adj.* Becoming a wife.

I met you

With all the tenderness of *wifely* love.

Dryden.

WIG, *s.* *Wig* being a termination in the names of men, signifies war, or else a heroic, from *wiga*, a word of that signification. *Gibson*.

WIG,

WIG, *s.* [contracted from *periwig*.] “Wigs were but little, if at all, worn in England, till the restoration of Charles the Second.” *Graves, Spir. Quixote*.—False hair worn on the head.

Triumphing Tories and desponding Whigs
Forget their feuds, and join to save their wigs. *Swift.*

A sort of cake. [*wegge*, Teut. Kilian.] *In the north, it is a bun or muffin. Ainsworth.*

WIG, a safe bay of Scotland, in Wigtonshire, in Loch Ryan, nearly opposite to the village of Cairn.

WIGAN, a borough and market town of England, in the county of Lancaster, situated near the small river Douglas. The town has a neat though irregular appearance; and has been lately much improved by the opening of two new streets, and the erection of several handsome buildings. An extensive trade is carried on in the manufacture of coarse home made linens, checks, calicoes, fustians, and other cotton goods. Here are also large brass and pewter works. The parish church, which is ancient beyond any traditional account, is commonly considered a handsome structure, composed of a nave, a spacious chancel, and two side aisles. Within the town is a chapel of the establishment; also five dissenting meetings, and two large Roman Catholic places of worship. A town-hall was built in 1721, at the joint expense of the Earl of Barrymore and Sir Roger Bradshaigh, the then representatives of the borough. A free school was erected, and liberally endowed, about the beginning of the last century, by voluntary contribution; and upwards of 30 years ago, the same liberality established a blue-coat school for 30 boys. A commodious work-house has been also built at the town's expense, where the necessitous and superannuated poor are comfortably accommodated; industry, in the more able, is furnished with the means; and the meritorious are encouraged and rewarded. A dispensary, built of stone, has been lately erected, and is supported by the benevolence of the town and its vicinity, where the poor, when properly recommended, have the benefit of the advice of an able and experienced physician, and are provided with medicines gratis. The best surgical assistance is administered in cases requiring it. At the north end of the town is a monumental pillar, erected in 1679, by Alexander Rigby, Esq., then sheriff of the county, to commemorate the valour and loyalty of Sir Thomas Tyldesley, who was slain on this spot in 1651, in the action wherein the earl of Derby was defeated by Lilburne. Wigan is a borough by prescription, and has had its privileges confirmed by the several charters of Henry III., Edward II., Edward III., Richard II., and Charles II. Its corporate body consists of a mayor, recorder, 12 aldermen, and 2 bailiffs. Two members are returned to parliament; and the right of election is vested in the free burgesses, in number about 200. The population in 1821, was 17,716; 39 miles south of Lancaster, and 196 north-west of London.

WIGBOROUGH, a hamlet of England, in Somersetshire.

WIGBOROUGH, GREAT and LITTLE, a parish and hamlet of England, in Essex; 7 miles south-south-west of Colchester.

WIGENHALL, ST. GERMAN, a parish of England, in Norfolk; 4 miles south-west of Lynn Regis. Population 490.

WIGENHALL, ST. MARY, a parish in the above county, half a mile south-west of the foregoing.

WIGENHALL, ST. MARY MAGDALEN, another parish in the same county; 5½ miles south-south-west of Lynn Regis. Population 424.

WIGENHALL, a parish in the above county, adjoining to the foregoing.

WIGGENHOLT, a parish of England, in Sussex; 7 miles north-north-east of Arundel.

WIGGESLEY, a hamlet of England, in Nottinghamshire; 8 miles east of Tuxford.

WIGGEY, a hamlet of England, in Surrey; 2 miles east-by-north of Reigate.

WIGGINGTON, a parish of England, in Hertfordshire;

1 mile south-east of Tring.—2. A parish in Oxfordshire; 5 miles west-north-west of Deddington.—3. A township in Staffordshire; 2 miles north of Tamworth. Population 664.—4. A parish in the West Riding of Yorkshire; 5 miles north of York.

WIGGLESWORTH, a township of England, West Riding of Yorkshire; 5½ miles south-south-west of Settle. Population 393.

WIGGOLD, a hamlet of England, in the parish of Cirencester, Gloucestershire.

WIGGONBY, a township of England, in Cumberland 4½ miles north-east of Wigton.

WIGHCOMICO, a short navigable river of the United States, in Maryland, which flows into the Potomac; 35 miles from its mouth.

WIGHILL, a parish of England, in Yorkshire, near the river Wharfe; 2½ miles north-by-west of Tadcaster.

WIGHOUGH, a hamlet of England, in Cheshire, adjoining to Malpas.

WIGHT, *s.* [wihht, Sax.] A person; a being. *Now used only in irony or contempt.*

Beshrew the witch! with venomous wight she stays,
Tedious as hell; but flies the grasps of love,
With wings more momentary swift than thought.

Shakspeare.

WIGHT, *adj.* [*wight* signifies *strong*. *Gibson.* See WIGHT as an initial. But our wight seems to be from the Su. Goth. *wig*, *agilis*, *alacer*.] Swift; nimble; not out of use, as Dr. Johnson pronounces it; but in some parts of the north still used for active, swift. *Grose* notices *weet* or *wite* thus used also in the south.

He was so wimble and so wight,
From bough to bough he leaped light,
And oft the pumies latched.

Spenser.

WIGHT. An initial in the names of men, signifies strong; nimble; lusty; being purely Saxon. *Gibson.*

WIGHT, ISLE OF, an island of England, lying on the coast of Hampshire, from which it is separated by a channel varying in breadth from 2 to 7 miles. From the eastern to the western angle it measures nearly 23 miles, and from the northern to the southern about 13. Its superficies is supposed to include 105,000 acres, of which about 75,000 are arable, and 20,000 are in pasturage. Through the middle of it, in the longest direction, extends a range of high hills, affording excellent pasturage for sheep, and commanding views over every part of the isle, with the ocean on the south side, and on the north the beautiful coasts of Hampshire. The face of the country is very diversified; bold hills of various elevations, intersected by rich and highly cultivated vales, the swelling promontory, and the lowly glen, appear in quick succession, to animate and give interest to the prospects. The land around the coast is, in some parts, very high, particularly on the south, or back of the island, as it is commonly termed, exceeding at St. Catherine's 700 feet above the sea. Here the cliffs are very steep, and vast fragments of rock, which the waves have undermined, lie scattered along the shore. On the northern side, the ground slopes to the water in easy declivities, excepting towards the Needles, or western point, where the rocks are bare, broken, and precipitous.

The height of the cliffs, of which the Needles form the extreme point, is in some places 600 feet above the level of the sea, and when viewed from the distance of about a quarter of a mile, have a very sublime and stupendous effect. These cliffs are frequented by immense numbers of marine birds, as puffins, razor-bills, will-cocks, gulls, cormorants, Cornish-choughs, daws, starlings, and wild pigeons; some of which come, at stated times, to lay their eggs and breed, while others remain there all the year. The cliffs are in some places perpendicular; in others they project and hang over, in a tremendous manner; the several strata form many shelves; these serve as lodgements for the birds, where they sit in thick rows, and discover themselves by their motions and flight, though not individually visible. Here are many caverns

caverns and deep chasms, that seem to enter a great way into the rocks; and in many places the issuing of springs forms small cascades of rippling water down to the sea. The country people take the birds that harbour in these rocks, and their eggs, by the perilous experiment of descending by ropes fixed to iron crows, driven into the ground. Thus suspended, they with sticks beat down the birds as they fly out of their holes. The soils are very various, but the prevailing kind is a strong, loamy earth, well adapted for agricultural purposes, and extremely fertile. The quantity of grain annually raised here was formerly computed to amount to seven or eight times the quantity necessary for all the inhabitants. The sorts of grain chiefly cultivated are wheat, barley, oats, beans, and pease; turnips, clover, trefoil, vetches, rye-grass, and potatoes, are also grown here. The rotation of crops varies according to the qualities of the soil. The meadow lands are extremely rich, and produce from one to three tons of fine hay per acre. The grain is in general sown broad cast; but the drill system has been introduced of late years, and found to answer exceedingly well in the light and sandy soils. The manures are lime, marl, and the produce of the farmyard: wheat is generally sown in October, and cut in August. The elevated tracts are mostly appropriated to pasturing sheep; the number annually shorn is about 40,000; the wool is extremely fine, and in much repute; the breed in general use is the Dorsetshire; about 5000 lambs are sold annually. The cows are principally of the Devonshire and the Alderney breed, though blended with other kinds; the butter is very good; but the cheese, which is made of the skim-milk, bears the appropriate name of the Isle of Wight Rock; the calves are remarkably fine. The horses are in general large; and as the farmers value themselves on the strength and beauty of their teams, great pains are taken to improve them. The breed of hogs is somewhat peculiar; they are large and tall, and make excellent bacon. The climate is extremely salubrious, and highly favourable to vegetation; its genial qualities, and near approximation in mildness to more southern regions, may be instanced by the profusion of genial myrtles, and by a vine plantation having been established at Mr. Pelham's marine cottage, near Steep Hill. The central parts of the isle are subject to frequent rains; the high range of hills proving a constant source of attraction to the vapours, and in the winter months involving all beneath them in gloom and humidity. The general fertility, however, is so little affected, and the vegetation is so abundant, that this island has often been styled the Garden of England; an appellation, perhaps, that is partly suggested to the mind by the innumerable plants and flowers which grow everywhere in wild luxuriance. All the higher parts of the isle are composed of an immense mass of calcareous matter, of a chalky nature, incumbent on schistus, which runs under the whole isle, and appears, at low water mark, on the coast near Mottiston. This becomes so indurated by exposure to the air, as to make very good whetstones. The lime-stone is burnt for manure; and in the pits where it is dug for that purpose, are found numerous echini, sharks' teeth, and ammoniæ. These fossils are particularly abundant in the range of cliffs which forms the southern shore; together with bivalve and turbinated shells of various descriptions: the cornua ammonis are of all sizes, from one inch to a foot and a half in diameter. A stratum of coal discovers itself at the foot of Bimbridge Cliff, and runs through the southern part of the isle, appearing again at Warden Ledge, in Freshwater parish. On the north side of this stratum lies a vein of white sand, and another of fuller's earth: and on the south side is another of red ochre. The coal is reported to be of good quality; the upper part of the stratum is about three feet wide; it dips to the northward. A shaft was sunk by the late Sir Robert Worsley, at Bimbridge, to ascertain its depth; but the vein was there so thin, that it was judged insufficient to defray the expense; and the undertaking was abandoned. Freestones of several descriptions are found here, but none of superior quality; though that obtained in the quarries near Quarr Abbey, was, some ages ago, in much request; but the superior nature of the Port-

land stone has long destroyed its reputation. Red and yellow ochres are particularly observable in Alum bay, to the north of the Needles, where their mingled strata variegates the cliffs. In this bay, native alum is found in large quantities, and in other respects a considerable field is open for the investigation of the mineralogist. Here also, and at Freshwater, are immense beds of micaceous or silvery sand, great quantities of which are annually shipped off for the glass and china manufactories of London, Bristol, and Worcester. Small masses of native sulphur are frequently picked up on different parts of the shore, as well as copperas stones; the latter are so extremely abundant on the south coast, that several small vessels are employed in freighting them to London, for the purpose of extracting the copperas. Argilla apyra, or pipe-clay, is likewise very plentiful in different parts of the isle. Several chalybeate springs have been found in different parts of the island. One of them, at Sand rock, under Chalk Cliff, according to the recent analysis of Dr. Marcet, contains an unusual proportion of alum and of iron, held in solution by the sulphuric acid, and has been reported by Dr. Lempriere, an army physician, who gave the water an extensive trial at the dépôt and invalid hospital at Parkhurst, to be most eminently useful in chronic cases of debility. About half a mile from this, at Pitland, is a spring, impregnated with sulphur: and at Shanklin is a spring whose waters are slightly impregnated with iron. The springs of clear water are very numerous, and in general extremely pure and transparent, from the natural percolation which they undergo through the lime-stone strata. The principal rivers are the Medina, the Yar, and the Wooten. The Medina, anciently called the Mede, rises near the bottom of St. Catherine's Down, and flowing directly northward, divides the island into two equal parts. Gradually widening in its course, it passes to the east of Newport, and in Cowes harbour unites its waters with the ocean. Numerous smaller streams also exist; and various creeks and bays run up from the sea. Timber, which in the time of Charles II., was so plentiful that, it is said, a squirrel might travel on the tops of the trees for many leagues together, is now much reduced in supplying the dock-yards at Portsmouth; and even Parkhurst or Carisbrooke forest, which includes about 3,000 acres of good land, is almost destitute of trees of any value. The woods of Swainston are of considerable extent; and those of Wooten and Quarr cover a superficies of nearly 1,100 acres; the oak and the elm are the most flourishing. Game is very plentiful, though not so abundant as formerly, owing to the great havoc made of late years by the numerous soldiers stationed here. Foxes, badgers, and polecats, are unknown in the island; though vipers exist in great plenty, and are caught in large numbers for medicinal purposes. Domestic fowls and poultry are bred here in considerable quantities, for the supply of the outward bound shipping. Great variety of fish is found on the coast, and in considerable abundance; those of the crustaceous kind are particularly numerous on the southern shores. The lobster and crab are of uncommon size, and extremely fine; some of the former are upwards of six pounds in weight; the latter is so abundant on a particular part of the coast, that a neighbouring village has obtained the name of Crab-Niton from this circumstance. The Isle of Wight prawns and cockles are very celebrated; the sand-eel is also very plentiful; the cuttle-fish is occasionally taken. The trade of the Isle of Wight is flourishing; the harbour of Cowes is particularly convenient for shipping and unshipping merchandise. The chief imports are coals, timber, deals, iron, wine, hemp, and fruits: the principal exports are wheat, flour, barley, malt, and salt. The chief manufactures are those of starch, hair-powder, and salt; the making of woollens, sacks, &c. has been carried to some extent in the house of industry; and lately a considerable lace manufactory has been established near Newport. The Isle of Wight is divided into two hundreds, called East and West Medina; 30 parishes; three boroughs, Newport, Newtown, and Yarmouth; the whole containing 5,055 houses, and 31,611 inhabitants, viz., 15,402 males, and 16,209 females; of whom

3309 families were returned as being employed in various trades, and 2460 in agriculture. Newport, containing more than 4000 inhabitants, is the principal town, and is distinguished for the regularity, width, and cleanliness of its streets, now lighted with gas, and its public edifices, particularly its market-place and reading institution; in the erection of both of which buildings, great taste has been displayed. Its shops are numerous, and well set off with every necessary article, at reasonable prices. Its market, which is held on Saturday, is abundantly supplied with provisions; and altogether there are few country towns so neat or so cheerful, or which possess so many recommendations, as that of Newport. The towns of Cowes and Hyde, which are also upon an extensive scale, from their local fascinations, have of late years become watering places of great resort; and as regular packets pass and re-pass twice, and in summer three times a day, between the two last towns and Southampton and Portsmouth, and to the westward, between Yarmouth and Lympington, the Isle of Wight is now rendered as accessible as most parts of the kingdom. West Cowes, which is its principal sea-port, is situated in long. 1. 17. W. and in lat. 50. 46. N.; and lies 12 miles south-by-east from Southampton, the same distance west-south-west of Portsmouth, and 86 miles south-west of London.

WIGHTLY, *adv.* Swiftly; nimbly.

Her was her, while it was day-light,
But now her is a most wretched wight;
For day that was *wightly* past,
And now at last the night doth hast.

Spenser.

WIGHTON, a parish of England, in Norfolk; 2 miles north-by-east of Little Walsingham. Population 433.

WIGLAND, a township of England, in Cheshire; 4 miles north-west of Whitchurch, Salop.

WIGMORE, a parish of England, in Herefordshire; 10 miles north-west of Leominster.

WIGRAM'S ISLAND, a small island on the north coast of New Holland, at the entrance into the gulf of Carpentaria, on the west shore.

WIGRY, a village of Poland, in the palatinate of Podlachia, situated on an island in an inland lake.

WIGSTON, GREAT, a parish of England, in Leicestershire; 3½ miles south-south-east of Leicester. Population 1,901.

WIGSTON, LITTLE, a hamlet of England, in Leicestershire; 6 miles north-west of Lutterworth.

WIGTOFF, a parish of England, in Lincolnshire; 7 miles south-west of Boston. Population 555.

WIGTON, a county in the south-west of Scotland, bounded on the east by Kirkcudbrightshire, on the south and west by the Irish channel, and on the north by Ayrshire; lying between 54. 38. and 55. 4. N. lat., and between 4. 16. and 5. 6. W. long.; and containing 451½ square miles, or 288,960 English acres. It is of an irregular form, deeply indented with bays, and is 23, 25, and 29 miles from north to south, and about 30 from east to west. It may be divided, according to the situation of its principal towns, into the three districts of Wigton, Whithorn, and Stranraer. Wigton, the eastern division, is watered by the river Cree, and several small streams, which descend from the mountains of Carrick. Whithorn, the south-east division, is of a triangular form, bounded by the bays of Wigton and Glenluce; towards the south, it terminates in a promontory called Burrowhead, near which lies the small island of Whithorn. Stranraer, also called the Ryndes or Rhinnes of Galloway, extends 29 miles from north to south, and is nearly separated from the rest of the county by Glenluce bay and Loch Ryan. The Mull of Galloway is the south, and the Corsewall, or Fairland point, the north, extremity of the peninsula. This county has a southern exposure, and its waters run southward, nearly parallel to one another. The surface of the county is diversified by numerous hills, none of which are supposed to rise more than 1000 or 1100 feet above the level of the sea. The richest lands lie near the coast. On the banks of the Cree, and

Vol. XXIV. No. 1663.

along the head of Wigton bay, there is a level tract, two miles long, and one and a half broad, which bears all the marks of having been once covered by the sea. It is much lower than the adjoining district; and the soil consists of a kind of sea sleet condensed, mixed with shells, and of great depth. After the sea had retired, this tract must have been covered with trees, the trunks of which are found in great numbers over the whole of it, covered with moss to the depth of from 5 to 10 feet. The rising grounds in the east of the county, through the parish of Wigton, and the lower part of Penningham, are for the most part arable; and, though hilly, are of a smooth surface, strong soil, and absorbent subsoil. The Rhinnes, with the exception of the greatest part of Portpatrick, is in general a very arable district. The hills along the whole of this peninsula rise to a considerable height; and seem, as if intended by nature, to form a strong barrier against the westerly winds. From a retentive subsoil they are often also spongy and wet, particularly on the western side of that part of the peninsula which extends along the bay of Luce. On the other extremity of the peninsula, even where the hills rise to the same height, and have a smoother surface, the subsoil is frequently absorbent; consequently they are better adapted for tillage.

The northern territory, called the Moors, is bleak and hilly, extending over three-fourths of the county, and containing only a few detached spots of arable land. The rivers in this county are of little importance. The Cree forms a considerable part of the eastern boundary. The Bladenoch issues from Loch Macbeary, which contains several islets; and, after a course of 24 miles, it falls into Wigton bay. The Tarrif, Luce, and other streams, are of little note. The coasts are deeply indented by navigable bays and inlets of the sea. Wigton bay and Luce bay advance far northward into the county. The former is a frith, navigable for about 15 miles. It is 3 miles broad, six miles from its entrance, and then gradually diminishes as it extends northward, dividing this county from the stewardry of Kirkcudbright. In several places of the bay there is good anchorage; in particular, a little below Creetown, where a ship of 500 tons may ride in safety. The bay of Luce contains several lesser bays, some of which might be converted into convenient harbours. The Mull of Galloway is the south point of Scotland, between Luce bay and the Irish sea. This county, as well as most parts of Scotland, was anciently covered with forests; but these have long ago been demolished; and proprietors find the renewal of them a difficult task, in places not sheltered from the influence of the sea. Some districts contain slate quarries, and marble, with promising appearances of lead, copper, and coal. This county contains 17 parishes, 5166 inhabited houses, 5863 families, and 26,891 inhabitants, of whom 12,205 are males, and 14,686 females. No part of it is more than 13 miles from the sea coast.

WIGTON, a parish of Scotland, in the above county, lying on the west side of the bay to which it gives name. It is of an irregular figure, approaching to an oblong square, extending 5½ miles in length, and 4 in breadth. Population 1711.

WIGTON, a royal burgh of Scotland, in the above parish, and capital of that district of Galloway to which it gives name. It is a small town, pleasantly situated on the side of a hill, near the mouth of the river Bladenoch. It is a place of considerable antiquity; and indeed few of the houses are of recent erection. It probably was a place of some consequence during the reign of Robert Bruce, who, it is thought, made it a royal burgh. It is a port of the custom-house, comprehending Wigtonshire, from the Mull of Galloway to the mouth of the river Cree. The town is governed by a provost, two bailies, and 15 councillors; and, with Whithorn, Stranraer, and New Galloway, sends a member to parliament. It is said to be uncommonly healthful, and instances of longevity are frequent; 11 miles north of Whithorn, and 105 south-west of Edinburgh.

WIGTON, a market town and parish of England, in Cumberland, situated 10½ miles from Carlisle, and 305 from London. This town is said to have been burned by the

Scots, when they plundered the abbey of Holme-Cultrum, in 1322. The van of the duke of Hamilton's army was quartered in and about Wigton in 1648. The market is by prescription, and appears to have been always held, as it is at present, on Tuesday. John de Wigton proved his right to it in the reign of Edward I, and to a fair for three days at Lady-day. The market is a very considerable one of corn, butchers' meat, and other provisions. On St. Thomas' day, December 21, in every year, there is an unusually large market for butchers' meat, apples, and honey, for the purposes of Christmas cheer. On Martinmas Tuesday, a large quantity of beef is brought to the market, and bought by the country people chiefly, to be salted for winter consumption. The old charter fair is held April 5, and is a great mart for black cattle, stallions, Yorkshire cloth, hardware, &c. There is a large and noted horse fair on the 20th of February. There was a free chapel near Wigton, attached to the hospital of St. Leonard, the lands belonging to which were granted by king Edward VI., to Thomas Dalston and William Denton. This hospital is supposed to have been at a place now called Spital, nearly a mile east of the town, now the property of Sir Wastell Briscoe, bart. of Crofton Hall. In the year 1723 an hospital for six widows of Protestant clergymen (who had enjoyed benefices) of the county of Cumberland, or such as had served two years as curates, was founded here by the executors of the reverend John Thomlinson, rector of Rothbury, in Northumberland. A free grammar school was also founded at Wigton, by this benevolent clergyman, in 1730, who having received 200*l.* collected by the inhabitants, gave a rent charge of 19*l.* 6*s.* 4*d.* per annum, out of his lands at Haughton. Dr. Thomlinson built the school-house, to which is attached a good house and garden, for the head master. Mr. Allison and Mr. Thomlinson have shewn their liberality as patrons of learning, by a handsome bequest to the school in the years 1792 and 1798.

The causes which have contributed to increase the population of Wigton, are the increase of manufactories, viz. for printed cottons, ginghams, checks, calicoes, &c. and the inclosure of extensive common lands, within the last 10 years. Eminent agriculturists consider the recent inclosures of land, (the chief produce of which is corn) for a circuit of 10 miles round Wigton, as deserving the appellation of the Granary of the county. In 1788, a new and elegant church was built. A handsome Sunday school, capable of containing 400 children, was built by voluntary subscription in 1820; a lasting monument of the charitable regard of the inhabitants for the best interests of the rising generation. There are three good inns, the Queen's Head, King's Arms, and the George, not inferior to any in the north of England, for comfortable accommodation and reasonable charges. The streets are clean and neat in general, and are now undergoing a complete and thorough repair, which, when finished, will be such an improvement to their appearance as will amply remunerate the proprietors of houses for the great expense incurred. There are some well built houses in the place. The river Wiza bounds the west and north side of the town, from which some fields, containing a rich alluvial soil, extend, by a gentle declivity, their green surface to the margin of the river, and form a beautiful landscape. The salubrious temperature of the air here is highly favourable to longevity. One mile south of Wigton is Old Carlisle, a considerable Roman station, well deserving the attention of every antiquarian. Horsley supposes that Olenacum was the name of this station, though, from the river Wiza, which runs near it, and the modern name of Wigton, only a mile from it, he feels inclined to call it Virosidum.

WIGTON, a township of England, West Riding of Yorkshire; 6 miles north-by-east of Leeds.

WIGTON BAY, a fine safe bay in Scotland, of considerable extent, running northward from the Solway frith into the interior of Galloway. It affords safe places of anchorage in many parts, and possesses several good harbours, particularly at the isle of Whithorn, Wigton, Garliestown, Creetown, and Gatehouse.

WIHICZ, or BIHICZ, a small town of European Turkey, in Bosnia, situated on an island in the river Unna. It was formerly fortified; 5 miles north-west of Ripach.

WIKE, a township of England, West Riding of Yorkshire; 4 miles south-by-west of Bradford.—2. Another township in the same Riding; 7 miles north-north-east of Leeds.

WIKINISKY CREEK, a river of the United States, in Pennsylvania, which runs west into the Susquehanna; 12 or 15 miles above the Juniatta.

WIKINISKY MOUNTAIN, a mountain of the United States, in Dauphine county, Pennsylvania, south of Wikinisky Creek.

WILBARSTON, a parish of England, in Northamptonshire; 4 miles south-west of Rockingham. Population 599.

WILBERFORCE, a parish of England, East Riding of Yorkshire; 5½ miles west-north-west of Pocklington.

WILBERFORCE, CAPE, a clifty cape on the north coast of New Holland, at the west entrance into the gulf of Carpentaria. Lat. 11. 52. S. long. 136. 33. E.

WILBERTON, a parish of England, in the isle of Ely, Cambridgeshire; 5½ miles south-west of Ely.

WILBRAHAM, or WILBURGHAM, GREAT, a parish of England, in Cambridgeshire; 7 miles east-north-east of Cambridge.

WILBRAHAM, or WILBURGHAM, LITTLE, another parish in the above county, adjoining to the foregoing.

WILBRAHAM, a township of the United States, in Hampden county, Massachusetts; 10 miles south-east of Springfield, and 77 west-south-west of Boston. Population 1776.

WILBY, a parish of England, in Norfolk; 3 miles north-east of East Harling.—2. A parish in Northamptonshire; 2 miles south-west of Wellingborough.—3. A parish in Suffolk; 3 miles east-south-east of Eye. Population 376.

WILCHINGEN, a small town of Switzerland, in the canton of Schaffhausen, district of Neukirch. Iron mines are wrought in the neighbourhood.

WILCOT, a parish of England, in Wiltshire; 1½ mile west-north-west of Persey. Population 566.

WILCOT, a village of England, in Oxfordshire, on the Akeman-street road, south of Charlbury. Here are vestiges of a Roman officina, for making bricks, tiles, and stucco. It was lately a spreading tumulus, consisting of fragments of Roman bricks and cement, and probably concealed pocaustic ducts, and other subterraneous works.

WILD, *adj.* [wīlb, Saxon; *wild*, Dutch.] Not tame; not domestic.

For I am lie, am born to tame you, Kate,
And bring you from a *wild* cat to a kate,
Conformable as other household kates. *Shakspeare.*

Propagated by nature; not cultivated.—Whatever will make a *wild* tree a garden tree, will make a garden tree to have less core or stone. *Bacon.*—Desart; uninhabited.—The wild beast where he wons in forest *wild.* *Milton.*—Savage; uncivilized. *Used of persons, or practices.*

Affairs that walk,
As they say spirits do, at midnight, have
In them a *wilder* nature than the business
That seeks dispatch by day. *Shakspeare.*

Turbulent; tempestuous; irregular.
His passions and his virtues lie confus'd,
And mixt together in so *wild* a tumult,
That the whole man is quite disfigur'd in him. *Addison.*

Licentious; ungoverned.
The barbarous dissonance
Of that *wild* rout that tore the Thracian bard. *Milton.*

Inconstant; mutable; fickle.
In the ruling passion, there alone
The *wild* are constant, and the cunning known. *Pope.*

Inordinate; loose. *Other*

Other bars he lays before me,
My riots past, my *wild* societies. *Shakspeare.*
Uncouth; strange.

What are these,
So wither'd, and so *wild* in their attire,
That look not like th' inhabitants o' the earth,
And yet are on't. *Shakspeare.*

Done or made without any consistent order or plan.
With mountains, as with weapons arm'd; they make
Wild work in heaven. *Milton.*

Merely imaginary.—As universal as these appear to be, an effectual remedy might be applied: I am not at present upon a *wild* speculative project, but such a one as may be easily put in execution. *Swift.*

WILD, *s.* A desert; a tract uncultivated and uninhabited.
We sometimes
Who dwell this *wild*, constrain'd by want come forth
To town or village nigh. *Milton.*

You rais'd these hallow'd walls: the desert smil'd,
And paradise was open'd in the *wild*. *Pope.*

WILD Basil, *s.* [*acinus*, Lat.] A plant. *Miller.*

WILD Cucumber, *s.* [*elaterium*, Lat.] A plant.—The branches are somewhat like those of the cucumber; but have no tendrils; the fruit is prickly, and when ripe bursts with great elasticity, and abounds with fetid juice. *Miller.*

WILD Olive, *s.* [*oleagnus*, Lat., from *ελαια*, Gr., *oliva*, and *αγρος*, *viter.*] This plant hath leaves like those of the chaste tree, and a fruit like an olive. *Miller.*

WILD Service, *s.* [*eratagus*, Lat.] A plant. *Miller.*

WILDA, a market town of the Austrian states, in Lower Styria, on the Murr; 13 miles south-south-east of Gratz.

WILDAU; or *WILDEN*, a large village of the Austrian states, in Tyrol, about a mile south of Innsbruck, on the river Sil.

WILDBAD, a neatly built small town of Germany, in Wirtemberg, on the Enz; 27 miles west of Stutgard. Population 1500.

WILDBERG, a small town of Germany, in Wirtemberg, on the river Nagold; 21 miles west-south-west of Stutgard. Population 1500.

WILDBOAR CLOUGH, a township of England, in Cheshire.

WILDE (James), a Swedish historian, was born in Courland in 1679, and educated at Riga; and having quitted that city in 1695, he sought farther improvement in several German academies, graduating M. A. at Griefswald. At the age of 21, such was his proficiency in various branches of literature, he was appointed co-rector of the cathedral school at Riga, and soon after teacher of politics, history, and eloquence, in the royal gymnasium of that place. Qualified by his talents and acquirements for a higher rank in the department of instruction, he was invited, in 1703, to be professor of history in the academy of Pernau; but declining this office, he was, in the following year, nominated by Charles XII. to fill the chair of Latin eloquence and poetry, which he occupied for five years. He was a philosopher, and a theologian, and often preached. His memory was singularly retentive; and this served him in various works which he composed after having lost his sight in 1741. Many of his works were lost at the capture of Pernau. He published at Frankfort, in 1717, "Diatriba de Jure et Judice Legatorum à Stephano Cassio;" "Sueciæ Historia Pragmatica, quæ vulgo jus publicum dicitur, &c." Holm. 1731, 4to.; "The Foundation, Nature, Origin, and Antiquity of the Swedish Laws, with an Account of the Changes and Alterations which have been made in them," ibid. 1786, 4to.; "Puffendorf's Introduction to the History of Sweden, with Additions, Proofs, and Notes," by J. Wilde; "I. Part," ibid. 1738, 4to.; "II. Part," ibid. 1743, 4to.; "Preparatio hodegetica ad Introductionem Puffendorffii in Svethici status Historiam, &c." ibid. 1743, 4to.—*Gen. Biog.*

WILDEMANN, a town of Hanover, in the Upper Hartz;

26 miles north-north-east of Gottingen. It has 1000 inhabitants.

WILDEN, a parish of England, in Bedfordshire; 5 miles north-east of Bedford.

WILDEN GRANGE, a township of England, North Riding of Yorkshire; 5½ miles north-by west of Easingwold.

WILDENBERG, a village of the Prussian province of Cleves and Berg; 35 miles east of Cologne. Population 1500.

WILDENFELS, a town of Germany, in Saxony; 6 miles east-south-east of Zwickau. It has 1000 inhabitants.

WILDENHAUL, or *WILDHAUS*, a village and parish of Switzerland, in the canton of St. Gall, near the source of the Thur. The celebrated Swiss reformer Ubrich Zwinglius, was born here in 1484; 8 miles south of Appenzell.

WILDENS (John), was born at Antwerp in 1584. He became an admired painter of landscapes, but under whom he acquired the art is unknown. He appears to have been a diligent observer of nature, and to have studied much in the open air; as his studies of forests, fields, &c. are numerous. When he had obtained considerable reputation, his talents introduced him to the notice of Rubens, who employed him to assist in executing the landscape parts of back-grounds, which he did with so great felicity, that there appears no dissimilarity in styles in the pictures on which they both took their respective parts. Two of his best pictures are in the chapel of St. Joseph at Antwerp, embellished with figures by Lang Jan: the subject of one is the Flight into Egypt, and of the other a reposito. He died in 1644, aged sixty.

WILDENSCHWERT, a town of Bohemia, on the river called the Still Adler; 10 miles east-by-north of Hohenmauth. Population 2200.

WILDENSTEIN, a small town of Germany, in Baden, near the Danube; 7 miles east-north-east of Mosskirch.

To WILDER, *v. a.* To lose or puzzle in an unknown or pathless tract.

Oh thou! who freest me from my doubtful state,
Long lost and *wilder'd* in the maze of fate,
Be present still. *Pope.*

WILDERNESS, *s.* A desert; a tract of solitude and savageness.

O my poor kingdom, sick with civil blows!
When that my care could not withhold thy riots,
What wilt thou do when riot is thy care?
O, thou wilt be a *wilderness* again,
Peopled with wolves thy old inhabitants! *Shakspeare.*

The state of being wild or disorderly. *Not in use.*
The paths and bowers, doubt not, but our joint hands
Will keep from *wilderness* with ease. *Milton.*

WILDERNESS, a post village of the United States, in Spottsylvania county, Virginia.

WILDERVANK, a town of the Netherlands, province of Groningen; 9 miles south-south-west of Winschoten. Population 2700.

WILDESHAUSEN, a town of Germany, in the duchy of Oldenburg, on the Hunte; 19 miles south-west of Bremen. Population 1800.

WILDFIRE, *s.* A composition of inflammable materials, easy to take fire, and hard to be extinguished.—When thou rann'st up Gadshill in the night to catch my horse, I did think thou had'st been an ignis fatuus, or a ball of *wildfire*. *Shakspeare.*

WILDGOOSECHASE, *s.* A pursuit of something as unlikely to be caught as the wildgoose.—If our wits run the *wildgoosechase*, I have done; for thou hast more of the wildgoose in one of thy wits, than I have in my whole five. *Shakspeare.*

WILDING, *s.* [*wildelinghe*, Dutch.] A wild sour apple.
Ten ruddy *wildings* in the wood I found,
And stood on tip-toes, reaching from the ground. *Dryden.*

WILDLY, *adv.* Without cultivation.—That which grows *wildly*

wildly of itself, is worth nothing. *More*.—Without tameness; with ferity; with disorder; with perturbation or distraction.

Young mothers *wildly* stare with fear oppress,
And strain their helpless infants to their breast. *Dryden*.

Without attention; without judgment; heedlessly.

As the unthought accident is guilty
Of what we *wildly* do, so we profess
Ourselves to be the slaves of chance, and flies
Of every wind that blows. *Shakspeare*.

Capriciously; irrationally.—Who is there so *wildly* sceptical as to question, whether the sun shall rise in the east? *Wilkins*.—Irregularly.

She, *wildly* wanton, wears by night away
The sign of all our labours done by day. *Dryden*.

WILDNESS, s. Rudeness; disorder like that of uncultivated ground.—The heath which was the third part of our plot, I wish to be framed, as much as may be, to a natural *wildness*. *Bacon*.—Inordinate vivacity; irregularity of manners.

He is giv'n

To sports, to *wildness*, and much company. *Shakspeare*.

Savageness; brutality.—He came in like a wild man; but such a *wildness* as shew'd his eye-sight had tamed him, full of withered leaves, which though they fell not, still threatened falling. *Sidney*.—Ferity; the state of an animal untamed; contrary to *tameness*.—Uncultivated state.

Their *wildness* lose, and quitting nature's part,
Obey the rules and discipline of art. *Dryden*.

Deviation from a settled course; irregularity.—A delirium is but a short *wildness* of the imagination; a settled irregularity of fancy is distraction and madness. *Watts*.—Alienation of mind.

Ophelia, I wish

That your good beauties be the happy cause
Of Hamlet's *wildness*; so shall I hope your virtues
May bring him to his wonted way again. *Shakspeare*.

WILDSCHITZ, a village of Bohemia, in the circle of Bitschow. Population 900.

WILDSTEIN, UPPER and LOWER, two villages of Bohemia; 7 miles north of Egra, with 1000 inhabitants.

WILDSWORTH, a hamlet of England, in Lincolnshire; 5 miles north-by-east of Gainsborough.

WILDUNGEN, LOWER, a town of Germany, in the county of Waldeck, surrounded with an old wall; 6 miles south-south-east of Waldeck. Population 1200.

WILDUNGEN, OLD, a town of the county of Waldeck. Population 900.

WILE, s. [pile, Sax.; *wiel*, Icel.] A deceit; a fraud; a trick; a stratagem; a practice artful, sly, and insidious.

My sentence is for open war; of *wiles*

More unexpert, I boast not; them let those

Contrive who need. *Milton*.

To **WILE**, v. a. [*wiela*, Icel. *pižlan*, Sax.] To deceive; to impose upon; to beguile.

So perfect in that art was Paridell,

That he Malbecco's halfe eye did *wile*,

His halfe eye he *wiled* wondrous well. *Spenser*.

WILES, CAPE, a steep head of land on the south coast of New Holland. Lat. 34. 57. S. long. 135. 33½. E.

WILFORD, a parish of England; 1½ mile from Nottingham. Population 494.

WILFUL, adj. Stubborn; contumacious; perverse; inflexible.—The *wilful* never want woe. *Proverb*.—Done or suffered by design.

Thou to me

Art all things under heaven, all places thou,

Who for my *wilful* crime are banish'd hence. *Milton*.

The silent stranger stood amaz'd to see

Contempt of wealth, and *wilful* poverty, *Dryden*.

WILFULLY, adv. Obstinate; stubbornly.—The mother, who being determinately, lest I should say of a great lady *wilfully*, bent to marry her to Demagoras, tried all ways which a witty and hard hearted mother could devise. *Sidney*.—By design; on purpose.

This let him know;
Lest, *wilfully* offending, he pretend
Surprisal. *Milton*.

WILFULNESS, s. Obstinacy; stubbornness; perverseness.

Never hydra-headed *wilfulness*

So soon did lose his seat, and all at once,

As in this king. *Shakspeare*.

WILHAMSTED, or **WILSHAMSTEAD**, a parish of England, in Bedfordshire; 4 miles south-by-east of Bedford. Population 597.

WILHELMSBAD, a village, with a well frequented mineral spring; about a mile from Hanau, in the west of Germany.

WILHELMSBURG, an island situated in the Elbe, not far from Hamburg, of which it is considered the key.

WILHELMSDORF, formerly **NIDER AALBACH**, a populous village of the Bavarian states, in the principality of Bayreuth.

WILHELMSHOHE, a village of Germany, electorate of Hesse; about 2 miles from Cassel.

WILHELMSTEIN, a small but strong fort of Germany; 19 miles west-north-west of Hanover.

WILHELMSTHAL, or **NEUSTADTEL**, a small town of Prussian Silesia; 18 miles south-by-east of Glatz.

WILHERMSDORF, a market town of Germany, in Bavarian Franconia, on the river Zenn.

WILLY, adv. By stratagem; fraudulently.—They did work *wilily*, and went and made as if they had been ambassadors. *Josh*.

WILINESS, s. Cunning; guile.—She supplied the weakness of force by *wiliness* of art, and advantage of treaty. *Howell*.

WILK, s. [peale, Sax.] A kind of periwinkle; a sea-snail.—The scallop cordial judg'd, the dainty *wilk* and limp. *Drayton*.

WILKES (John), was born in London in 1727, and finished his studies at the university of Leyden. Soon after his return to England, he married a Miss Mead, who was a lady of large fortune, and settled at Aylesbury. This lady, though highly respectable both in her character and connections, and belonging to a dissenting family as well as himself, was older than he, and in other respects an unsuitable wife, so that the attachment was originally formed, on his part, from lucrative motives: one daughter was the fruit of this connection. Mr. Wilkes, thus furnished with the means of profusion, lived in an expensive style, and being little anxious about domestic happiness, associated with the gay and licentious, to whose habits and manners his principles and character were sacrificed. Urged by his partial friends, who thought him qualified for public life, he offered himself, in 1754, as a candidate for the town of Berwick, but his views were disappointed. In this and in several other instances, he counteracted the inclinations and wishes of his wife, so that their continued connection was a source of disquietude, and they determined to separate. In 1757 he was returned as a member for the borough of Aylesbury, the consequence of which was an increase of expenditure, that involved him in pecuniary embarrassments, and led him to dishonourable practices, and particularly to an attempt of freeing himself from the obligation of paying his wife's annuity, in which he failed of success. His parliamentary patron was earl Temple, by whose influence he was chosen representative for Aylesbury; and from whose interest he expected to obtain some place under government, which the perplexity of his circumstances rendered particularly desirable. But he was once and again disappointed; and he ascribed his failure to the interference of lord Bute. In 1762 he connected himself, as a political writer,

ter, with lord Temple and Mr. Pitt, and defended them, whilst he exposed the ministry, on occasion of the rupture with Spain, in a pamphlet entitled "Observations on the Papers relative to the Rupture with Spain." This publication was followed in 1763 by an ironical dedication to lord Bute, of Ben Jonson's "Fall of Mortimer," in which he indulged unrestrained levity against the "favourite," as he was called, and his antipathy to the Scottish nation; which was further manifested in a periodical paper called "the North Briton," commenced in 1762, and intended to counteract "the Briton," which Smollet conducted in defence of lord Bute's administration. The North Briton, however, was written with a spirit so consonant to the sentiments of the public at that period, that it probably contributed to the resignation of that nobleman in April, 1763. The 45th number of this periodical work was published on the 23d of April, and contained so severe and sarcastic a comment on the king's speech, that his ministers, under the sanction of the crown-lawyers, determined upon a prosecution: and the home secretary of state, lord Halifax, issued a "general warrant;" *i. e.* a warrant in which no particular names were specified, for the apprehension of the authors, printers, and publishers of that paper. As soon as it was discovered that Wilkes had given orders for the printing, he was taken into custody, and brought before the two secretaries of state. Perfectly self-possessed, and avowing the illegality of his arrest, he refused to answer any interrogatories; and a habeas corpus which had been sued out for him being evaded, he was closely confined in the Tower. However, he was soon after brought by habeas corpus before the court of common pleas, when lord chief justice Pratt declared the opinion of that court against the legality of his commitment, so that he was discharged amidst the acclamations of the audience and of the populace. In the course of these proceedings he was deprived of his commission as colonel, by the king's order; and his patron, lord Temple, lost his post of lord-lieutenant of the county. This nobleman, at his own expense, availed himself of the legal decision against general warrants, and commenced actions against the king's messengers, the secretaries, the under secretary, and the solicitor of the treasury; in all which the prosecutors obtained damages, which were paid by the crown, in consequence of an express order of council. Thus the doctrine of the illegality of such warrants was established, and for this accession to the cause of liberty the public were indebted to John Wilkes, lord Temple, and lord chief justice Pratt, afterwards lord Camden. Wilkes, not satisfied with this triumph, proceeded, against the advice of his friends, to set up a press in his own house, and to reprint the North Briton; for which he was again prosecuted to conviction. Having withdrawn to France in 1763, he was expelled from the house of commons, because he did not appear to answer the charges that were produced against him. The next attack that was directed against him was occasioned by his printing an indecent and profane piece, called "Essay on Woman," and said to have been written by Mr. Potter, son of the archbishop of the same name; and as some scandalous reflections on a bishop were introduced in this piece, complaint of breach of privilege was made in the house of lords; and on a prosecution, he was found guilty of both the crimes of blasphemy and libel. By his continued absence, he incurred the penalty of outlawry. Upon a change of ministry he returned to England, and delivered himself to custody; and confiding in his popularity, he offered himself as a candidate to represent the city of London; but failing in this object, he was immediately elected for the county of Middlesex. Although his sentence of outlawry was reversed as illegal, he was condemned for his two libels to an imprisonment of 22 months, and a fine of 1000*l.* In 1769 he was charged with being the author of a pamphlet relating to the riots, occasioned by his imprisonment, and expelled from the house; and being immediately re-elected, he was declared incapable of a seat in the house during the existing parliament. He now became popular as the martyr of liberty, and large sums were collected towards the payment of his debts. He was again re-

elected, and his election was declared void. At the next election, the court-candidate, colonel Luttrell, whose votes were about a fourth of those of Mr. Wilkes, was declared the sitting member. This measure caused dissatisfaction and complaint through the country, and produced petitions for the dissolution of parliament. Wilkes, though excluded from parliament, was chosen an alderman of the city of London; and in the exercise of his office as a magistrate, he resisted with his usual spirit exactions of authority which he considered as illegal; and actually liberated one of the printers of newspapers in which the speeches of members of parliament were detailed, and who had been arrested by royal proclamation. Two others were released by lord mayor Crosby and alderman Oliver, who being members of the house were committed to the Tower. Wilkes was ordered to attend at the bar of the house; but in a letter to the speaker, he objected, that in the order for attendance, no notice was taken of his being a member of the house, and his attendance in his place had not been desired, which forms, he said, were essential: he also demanded his seat, and then he would give a full account and justification of his conduct. The house, sensible of the difficulty to which it had subjected itself, saved its authority by adjourning for the day on which Wilkes was ordered to attend. In 1772 Wilkes was chosen one of the sheriffs for London and Middlesex, and in 1774 lord mayor of London. Having conducted himself with propriety and reputation in his public offices, he was re-elected in 1776 a representative for the county of Middlesex; and was allowed to take his seat without opposition. In parliament, he opposed the measures that occasioned the American war; and on the accession of the Rockingham administration, he carried his motion for rescinding the decision of the house of commons, which gave Luttrell a seat by a minority of votes. In 1779 he succeeded in his application for the office of chamberlain in the city of London, and retained it during the remainder of his life. Tired of political conflicts, the latter years of his life passed off without much notice, so that, to adopt his own expression, he was an "extinguished volcano;" and he expired at the house of his daughter in 1797, in the 73d year of his age. His private history affords no memorial that is either amusing or instructive. The early errors of his conduct cast a shade over his character. His literary talents and attainments, devoted as he was to pleasure, and engaged in business, never attracted much notice; though as a companion he knew how to render himself agreeable. Although his patriotism might possibly originate in disappointed views and expectations, he was consistent and steady in maintaining the cause to which he was attached; and he was, either intentionally or incidentally, and by an intrepidity and self-possession which he possessed in an eminent degree, the instrument of gaining some important advantages to public and private liberty. *Atm. Mem. of Wilkes. Ann. Reg. Gen. Biog.*

WILKES, a county of the United States, in the north-west part of North Carolina. Population 9054, besides 1194 slaves.

WILKES, a post town of the United States, and capital of Wilkes county, North Carolina; 50 miles west of German-town.

WILKES, a township of the United States, in Gallia county, Ohio. Population 187.

WILKES, a county of the United States, in the north-west part of Georgia. Population 14,887; slaves 7284. Chief town, Washington.

WILKESBARRE, a post town of the United States, and capital of Luzerne county, Pennsylvania, on the Susquehanna. A bridge is building across the river. The country around abounds in coal; 115 miles north-north-west of Philadelphia. Population 1225. Lat. 41. 12. N. long. 75. 55. W.

WILKESBY, a parish of England, in Lincolnshire; 5 miles south-south-east of Horncastle.

WILKESLEY, a township of England, in Cheshire; 8 miles south-by-west of Nantwich.

WILKINS (David), a learned antiquary, was born in

1685, and in early life more than once made the tour of Europe, acquiring a knowledge of most modern languages. In 1715 he was appointed by archbishop Wake keeper of the Lambeth library, of which he made a catalogue, and for his three years' labour in this way he was recompensed with several preferments, such as the rectories of Hadley and Monk's Ely, the archdeaconry of Suffolk, and a canonry of Canterbury. Among his principal publications we may reckon "Novum Testamentum Copticum," Oxon, 1716, 4to.; an edition of "Leges Saxonicae ecclesiasticae et civiles," with many valuable additions, 1721, fol.; "Joannis Seldeni Opera omnia," 1726, 3 vols. fol.; "Pentateuchus Copticus," 1731, 4to.; "Concilia Magnae Britanniae," 4 vols. fol. 1736; and a learned preface to Bishop Tanner's "Britannico-Hibernica." He married the eldest daughter of Thomas lord Fairfax, settled in Scotland, and died in 1745, in his 60th year.—*Nichols's Lit. Anecd. Gen. Biog.*

WILKINS (John), D. D., an English prelate, was born near Daventry, in Northamptonshire, in 1624, and finished his education at Magdalen-hall, Oxford, where he graduated M. A. He afterwards took orders, and became chaplain, first to lord Say, and then to Charles, count palatine of the Rhine. At the commencement of the civil war he joined the parliament, took the solemn league and covenant, and became warden of Wadham college. In 1649 he graduated D. D., and in 1656 married the sister of Oliver Cromwell. In 1659 he was nominated head of Trinity college, Cambridge; but being ejected on the restoration of king Charles II., he became preacher to the society of Gray's Inn, London, and rector of St. Lawrence, Jewry; about which time he was introduced into the Royal Society as fellow and one of the council, and advanced to the see of Chester. He was distinguished by his moderation, and was reproached on this account by his enemies, who represented him as wavering in his religious principles. His character is thus delineated by Dr. Burnet: "He was a man of as great a mind, as true a judgement, as eminent virtues, and of as good a soul, as any I ever knew; and though he married Cromwell's sister, yet he made no other use of that alliance but to do good offices, and to cover the university of Oxford from the sourness of Owen and Goodwin. At Cambridge he joined with those who studied to propagate better thoughts, to take men off from being in parties, or from narrow notions, from superstitious conceits, and fierceness about opinions. He was also a great observer and promoter of experimental philosophy, which was then a new thing, and much looked after. He was naturally ambitious, but was the wisest clergyman I ever knew. He was a lover of mankind, and delighted in doing good." He also possessed, according to this historian, "a courage which could stand against a current, and against all the reproaches with which ill-natured clergymen studied to reproach him." His principal works are the following: *viz.* "The Discovery of a New World; or, a Discourse tending to prove that it is probable there may be another habitable World in the Moon," London, 1638, 4to., written when he was only twenty-four years of age; "Discourse concerning the Possibility of a Passage to the World in the Moon;" "Discourse concerning a new Planet, tending to prove that it is probable our Earth is one of the Planets," *ibid.* 1640, 8vo.; "Mercury; or, the Secret Messenger: shewing how a man may with privacy and speed communicate his thoughts to a friend at any distance," *ibid.* 1641, 8vo.; "Mathematical Magic; or, the Wonders that may be performed by Mechanical Geometry," in two books, *ibid.* 1648 and 1680, 8vo. These latter five, composing his mathematical works, were printed at London in one volume, 8vo. 1708. "Essay towards a real Character and a philosophical Language," *ibid.* 1668, fol.; "Of the Principles and Duties of Natural Religion," two books, *ibid.* 1675, 8vo. published by Dr. Tillotson. Also, "Sermons preached on several Occasions," and some others. Life prefixed to his Philosophical and Mathematical Works.

WILKINSON, a county of the United States, in the south-west part of Georgia. Population 2154, besides 318 slaves.

WILKINSON, a county of the United States, in the south-west corner of Mississippi. Population 7275. Chief town, Woodville.

WILKINSON, a fort of the United States, in Hancock county, Georgia, on the Oconee, a little below Milledgeville.

WILKINSONVILLE, a town of the United States, in Randolph county, Illinois, on the Ohio, about half way between Fort Massac and the mouth of the Ohio.

WILKINSONVILLE, a post village of the United States, in Chesterfield county, Virginia.

WILKINTHORPE, a hamlet of England, in the parish of Horsington, Somersetshire.

WILKOWISZKEN, a town of Poland; 31 miles east of Gumbinnen, with 1800 inhabitants, part of whom are Jews.

WILL, *s.* [pilla, Saxon; *wille*, Dutch; *wilja*, M. Goth. vox antiquissima, plurimisque linguis usitata. *Serenius.*]—That power by which we desire, and purpose; *velleity*.—What freedom the *will* naturally, under this corrupt state, hath, I do not consider. *Hammond.*—Choice; arbitrary determination.

Will holds the scepter in the soul,

And on the passions of the heart doth reign.

Davies.

Discretion; choice.—Go then the guilty at thy *will* chastize. *Pope.*—Command; direction.—At his first sight the mountains are shaken, and at his *will* the south wind bloweth. *Eccles.*—Disposition; inclination; desire.

I make bold to press upon you with so little preparation.—

You're welcome; what's your *will*?

Shakspeare.

Power; government.—Deliver me not over unto the *will* of mine enemies. *Psalms.*—Divine determination.—I would give a thousand furlongs of sea for an acre of barren ground. The *wills* above be done; but I would fain die a dry death. *Shakspeare.*—Testament; disposition of a dying man's effects.

Another branch of their revenue still

Remains, beyond their boundless right to kill,

Their father yet alive, impow'rd to make a *will*.

Dryden.

GOOD-will. Favour; kindness.

I'll to the doctor, he hath my *good-will*,

And none but he to marry with Nan Page.

Shakspeare.

GOOD-will. Right intention.—Some preach Christ of envy, and some of *good-will*. *Phil.*—ILL-will. Malice; malignity.

WILL with a *whisp*, *s.* [*Ignis fatuus*, Lat.] Jack with a lantern. *Will with the whisp* is a luminous appearance of a round figure, in bigness like the flame of a candle; but sometimes broader, and like a bundle of twigs set on fire. It sometimes gives a brighter light than that of a wax-candle; at other times more obscure, and of a purple colour. When viewed near at hand, it shines less than at a distance. They wander about in the air, not far from the surface of the earth; and are more frequent in places that are unctuous, mouldy, marshy, and abounding with reeds. They commonly appear in summer, and at the beginning of autumn, and are generally at the height of about six feet from the ground. Now they dilate themselves, and now contract. Now they go on like waves, and rain as it were sparks of fire; but they burn nothing. They follow those that run away, and fly from those that follow them. Some that have been catched were observed to consist of a shining, viscous, and gelatinous matter, like the spawn of frogs, not hot or burning, but only shining; so that the matter seems to be phosphorus, prepared and raised from putrified plants or carcasses by the heat of the sun; which is condensed by the cold of the evening, and then shines. *Muschenbroek.*

Will-a-wisp misleads night-faring clowns,

O'er hills and sinking bogs.

Gay.

To WILL, *v. a.* [*wiljan*, Gothic; *pillan*, Saxon; *willen*, Dutch.] To desire that any thing should be, or be done; or not be, or not be done.—To *will*, is to bend our souls to the haying or doing of that which they see to be good. *Hooker.*

Let

Let Richard be restor'd to his blood,
As *will* the rest; so *willeth* Winchester. *Shakspeare.*

To be inclined or resolved to have.

She's too rough for me;
There, there, Hortensio, *will* you any wife? *Shakspeare.*

To command; to direct.

How rarely does it meet with this time's guise,
When man was *willed* to love his enemies? *Shakspeare.*

It has a loose and slight signification.—Let the circumstances of life be what, or where they *will*, a man should never neglect improvement. *Watts.*—It is one of the signs of the future tense; of which it is difficult to show or limit the signification.—*I will come.* I am determined to come; importing choice.—*Thou wilt come.* It must be so that thou must come, importing necessity; or it shall be that thou shalt come, importing choice.—*Wilt thou come?* Hast thou determined to come? importing choice.—*He will come.* He is resolved to come; or it must be that he must come, importing either choice or necessity.—*It will come.* It must so be that it must come; importing necessity. The plural follows the analogy of the singular.

To WILL, *v. n.* To dispose of effects by will.—The which *willed* in his testament. *Brand.*

WILL'S COVE, a creek on the north-east coast of the island of St. Christopher, to the south-west of Muddy point.

WILL'S CREEK, a small river of North America, which falls into the Muskingum, a tributary stream of the Ohio.

WILL'S CREEK, a river of the United States, which rises in Pennsylvania, and runs south by west into the Potomac, at Cumberland, in Maryland.

WILLAERT (Adrian), the disciple of John Mouton, and master of Zarlino, has long been placed at the head of the Venetian school of counterpoint by the Italians themselves. He was born at Bruges in Flanders.

Zarlino (P. iii. p. 268.) assigns to Adriano the invention of pieces for two or more choirs; and Piccitoni (Guida Armonica) says, that he was the first who made the bases in compositions of eight parts, move in unisons or octaves; particularly when divided into two choirs, and performed at a distance from each other, as then they had occasion for a powerful guide. The dexterity and resources of this author, in the construction of canons, are truly wonderful, as is, indeed, his total want of melody; for it is scarcely possible to arrange musical sounds, diatonically, with less air or meaning, in the single parts. But there are many avenues through which a musician may travel to the temple of Fame; and he that pursues the track which the learned have marked out, will perhaps not find it the most circuitous and tedious; at least theorists, who are the most likely to record the adventures of passengers on that road, will be the readiest to give him a cast. A learned and elaborate style conceals the want of genius and invention, more than the free and fanciful productions of the present times.

He lived to a great age, and filled a very high musical station; maestro di capella of St. Mark's church at Venice. His works and scholars were very numerous; and among those to whom he communicated the principles of his art, there were several who afterwards arrived at great eminence; such as Cipriano Rore, Zarlino, and Costanzo Porta. In the title of a book, published at Venice, 1549, there are "Fantasie," or "Ricercari," composed dallo eccellentissimo Adrian Vuigliart, and Cipriano Rore, suo discepolo. P. Martini, in his Saggio di Contrappunto, P. ii. p. 266, calls Adrian Willaert the master of Costanzo Porta. *Burney.*

WILLAFANS, a small town of France, department of the Doubs; 14 miles south-east of Besançon. Population 1000.

WILLAMANTIC, a river of the United States, in Connecticut. It is a principal branch of the Shetucket, which it joins north of Lebanon.

WILLAND, a parish of England, in Devonshire; 2½ miles north-north-east of Columpton.

WILLANMEZ'S ISLE, a small island off the north coast of New Britain. It is high in the centre, low at the sides, and wooded. This island is supposed to be inhabited. Lat. 5. 15. S. long. 147. 39. E.

WILLASTON, a township of England, in the parish of Wybunbury, Cheshire.

WILLASTON, or WOOLLASTON, a township in the above county; 3 miles east of Great Neston.

WILLAWAKY, an Indian town of the United States, on the north-west coast of Lake Michigan. Lat. 47. 45. N. long. 87. 10. W.

WILLCRICK, a parish of England, in Monmouthshire; 4 miles east-south-east of Caerleon.

WILLEBADESSEN, a town of Prussian Westphalia, in the government of Minden, on the Nette; 13 miles east-south-east of Paderborn, with 1200 inhabitants.

WILLEBROCKE, an inland town of the Netherlands, situated on the river Ruppel, and the canal of Mechlin; 15 miles north of Brussels. It contains 1700 inhabitants.

WILLEMANTIC, or WILLEMANSSET, in the United States, rapids in Connecticut river, Massachusetts; about a mile below South Hadley canal. They are avoided by opening a channel, a mile in length, on the western shore.

WILLEMBERG, or WIELBARK, a town of East Prussia; 79 miles north of Warsaw. Population 1400.

WILLEN, or WYLLIEN, a parish of England, in Buckinghamshire; 2 miles south of Newport Pagnell.

WILLENHALL, a township of England, in Warwickshire; 2½ miles south-east of Coventry.—2. A township in Staffordshire; 3 miles west of Walsall. Population 3523.

WILLEQUENGAUGUM, a lake in the United States, on the east side of Maine, at the sources of the St. Croix.

WILLER, *s.* One that wills.—Cast a glance on two considerations. 1. What the will is, to which 2d, who the *willer* is, to whom we must submit. *Barrow.*

WILLERBY, a township of England, East Riding of Yorkshire; 6 miles south-by-west of Scarborough.—2. Another township in the same Riding; 5½ miles west-north-west of Kingston-upon-Hull.

WILLERSEY, a parish of England, in Gloucestershire; 3 miles west of Chipping Campden.—2. A parish of England, in Herefordshire; 8 miles west-south-west of Weobley.

WILLESBOROUGH, a parish of England, in Kent, near the river Stour; 2 miles east-south-east of Ashford. Population 435.

WILLESDEN, or WILSDON, a parish of England, in Middlesex; 8 miles north-west of St. Paul's, London. Population 671.

WILLESLEY, a parish of England, in Leicestershire; 2½ miles south-west of Ashby-de-la-Zouch.

WILLET, a township of the United States, in Courtland county, New York.

WILLET'S BAY, a bay on the north-west coast of the island of St. Christopher, about a mile to the south-west of Dieppe bay.

WILLEY, a township of England, in Herefordshire; 2 miles north of Presteign, Radnor.—2. A parish in Salop; 4 miles north-by-west of Bridgnorth.—3. A parish in Warwickshire; 7 miles north-by-west of Rugby.

WILGOTTHEIM, a village of France, in Alsace, with 1800 inhabitants.

WILLHALL, a hamlet of England, in the parish of Alton, Southamptonshire.

WILLHAMPSTEAD, a parish of England, in Bedfordshire; 3½ miles from Bedford.

WILLI and *Vili*, among the English Saxons, as *viele* at this day among the Germans, signified many. So *Willielmus* is the defender of many; *Wilfred*, peace to many; which are answered in sense and signification by Polymachus, Polycrates, and Polyphilus. *Gibson's Camden.*

WILLIAM of Nassau, prince of Orange, and founder of the Dutch republic, was born in Germany in 1533, and descended from Lutheran parents, though, being introduced into the service of Mary queen of Hungary, and afterwards of Charles V., he conformed to the Catholic religion. See HOLLAND.

WILLIAM of Wykeham, an English prelate, was born in 1324,

1324, at Wykeham, in Hampshire, and by the liberality of a patron, educated at Winchester school, and afterwards recommended to Edyngdon, bishop of Winchester, who introduced him into the service of King Edward III. about his 23d year. Acquiring extraordinary skill in architecture, he was appointed in 1356 clerk of the king's works in two manors, and surveyor of the royal works at the castle and in the park of Windsor. The king was so highly satisfied with his conduct in these similar departments, that he recompensed him by several preferments, civil and ecclesiastical. In 1359 he was nominated chief warden and surveyor of the royal castles of Windsor, Leeds, Dover, and Hadlam, and the several other castles, manors, and parks. Whilst he had only the clerical tonsure, he enjoyed many ecclesiastical dignities; and, in order to his further advancement in the church, he was ordained priest in 1362. In the following year he was made warden and justiciary of the royal forests south of Trent, and in 1364 keeper of the privy-seal. He was also chief of the privy-council, and governor of the great council; and besides other civil preferments which he enjoyed, he succeeded Edyngdon, in 1366, as bishop of Winchester, which paved the way for his elevation to the post of high-chancellor in 1367, of which latter dignity, however, he was divested in 1370. Thus possessing ample means of munificence in a state of celibacy, and a liberal spirit, his profession as an architect led him to repair and erect numerous buildings in his see at an expense of no less than 20,000 marks. He also directed his attention to the improvement and proper discipline of the religious houses comprehended within his diocese. For the better education of his clergy, he laid the foundation of a college in Oxford, which was to be supplied with students from a seminary at Winchester. He was interrupted, however, in his liberal designs of general utility by an impeachment for misconduct in the administration of public affairs, occasioned by the influence of the Duke of Lancaster, who had conceived a prejudice against him; and, in consequence of this impeachment, his temporalities were seized to the king's use, and he was banished from court. The clergy, however, interfered, and the people regarded him as a sufferer from the duke's exorbitant power; so that a tumult ensued, that procured the restoration of his temporalities, and his recovery of the royal favour, a little while before the king's death. During the turbulent reign of Richard II., Wykeham conducted himself with caution, and succeeded in the establishment of his two colleges. For that at Oxford he obtained a patent in 1379, and it was completed in 1386. It is now known by the name of the New college. His college or school at Winchester was finished in 1393. He also undertook the repair of the cathedral, which was a Saxon edifice of the eleventh century, and in the course of ten years rebuilt it in the Gothic style. In 1384 he was induced, against his inclination, to accept the office of high-chancellor, which he resigned again in 1391, after having restored the public tranquillity. When the king recovered his authority, he procured a parliament in 1397, which impeached several of the commissioners, who had almost divested him of his authority, of high treason; but Wykeham, who was one of them, escaped with a forced loan of 1000*l*. He attended the first parliament of Henry IV. in 1399, which deposed Richard, but was not present at the council which adjudged him to perpetual imprisonment. As his health declined, he was disabled from performing the duties of his office; and therefore nominated coadjutors in his bishopric, settled all his temporal and spiritual concerns, and with tranquillity waited his dismissal from the world. This happened in September, 1404, when he had completed his 80th year. His remains were interred in his own chapel or oratory in Winchester cathedral, where a tomb of white marble was erected to his memory.—*Biog. Brit.*

WILLIAM, POINT, a cape on the west coast of North America, and south point of entrance into Bellingham's bay. Lat. 48. 37. N. long. 237. 43. E.

WILLIAM, FORT, a fortress of Scotland, situated at the eastern extremity of Loch Linnhe, where it receives the river Lochy. In the year 1745 it stood a siege of five weeks. It

is, however, by no means a place of strength. It is garrisoned by a governor, fort-major, and a company of soldiers; 74 miles north of Inverary, 29½ south-west of Fort Augustus, and 17 east of Strontian village.

WILLIAM'S RIVER, a river of the United States, in Vermont, which rises in Chester, and runs into the Connecticut, 3 miles north of Bellows Falls.

WILLIAMS (Daniel), D. D. an eminent non-conformist divine, was born at Wrexham, in Denbighshire, about the year 1643 or 1644. The disadvantages of his early education were counterbalanced by the natural vigour of his mind, and by future application. Devoting himself to the ministry among Protestant dissenters, he was one of the first who had resolution to engage in it, after the privations and sufferings which followed the Act of Uniformity in 1662. At the age of nineteen years he was admitted a preacher among the Presbyterians, and for several years officiated occasionally in several parts of England. Being here in danger of persecution, he accepted an invitation to become chaplain to the countess of Meath in Ireland, where dissenters enjoyed a greater degree of liberty; and some time afterwards he became pastor to a respectable congregation in Wood-street, Dublin. Here he continued for nearly twenty years, exercising his ministry with acceptance and usefulness, and conducting himself so as to maintain harmony with his brethren in the ministry, and to secure respect and esteem from the Irish Protestants in general. During his residence in Dublin, he married a lady of an honourable family, with a considerable estate. Towards the close of the reign of James II., his opposition to popery rendered his situation in Ireland unpleasant to him, and he therefore came over to England in 1687, and settled in London. With the famous Richard Baxter he cultivated an intimate acquaintance; and at his death, in 1691, he was chosen to succeed him at the Merchants' Tuesday lecture in Pinners'-hall. Some of his fellow-lecturers advanced what he conceived to be Antinomian tenets; and these dangerous notions he thought it to be his duty to oppose. Hence arose a suspicion of his orthodoxy, and an attempt to exclude him from the lecture. Their design was frustrated by a majority of the subscribers; but as their opposition was inveterate, it was thought most advisable to separate, and to establish another Tuesday lecture at Salters'-hall. Three of the most respectable of the old lecturers, viz. Dr. Bates, Mr. Howe, and Mr. Alsop, seceded with Mr. Williams.

Upon the publication of the works of Mr. Crisp, who avowed himself the champion of Antinomianism, Mr. Williams undertook to refute them; and in 1692 published his "Gospel Truth stated and vindicated, &c." 8vo.; a work which, though now almost forgotten, was deservedly approved by the principal London ministers of that period; and as it is distinguished by great clearness and strength of argument, as well as a truly Christian temper, it served to check the pernicious errors which were then industriously circulated.

In the year 1701 Mr. Williams, after having been for some time a widower, married a second wife of considerable fortune and distinguished worth, who survived him.

During the reign of queen Anne he exerted himself, though ineffectually, in opposing the bills against occasional conformity, and for imposing the sacramental test upon the dissenters in Ireland. Soon after the accession of George I., the health of Dr. Williams began to decline; and at length an asthmatic disorder terminated his life on January 26, 1715-16, in the 73d year of his age.

"He had been blessed by nature," says his biographer, "with a strong and vigorous constitution, and possessed a sound, penetrating judgment, and great strength of memory. The subjects of his pulpit performances were always practical and useful; his sentiments solid, pertinent, and distinguished by an uncommon variety; and his manner of enforcing them powerful and impressive. He was remarkable for his boldness and courage in avowing and defending what he conceived to be truth of importance, and 'pursued what he thought right with a blunt integrity and unshaken resolution.' At the same time his candour towards those who differed

differed from him, his kind treatment of persons who had endeavoured to injure his own reputation, and his conscientious, tender regard for that of others, were prominent features in his character.

“By his last will, besides liberal benefactions to numerous benevolent and charitable institutions in London and Dublin, he provided for the support of an itinerant preacher to the native Irish, of two persons to preach to the Indians in North America, and of several charity-schools in England and Wales. He directed that a certain fixed sum, from the income of his estates, should be appropriated to the assistance of poor ministers, the widows of poor ministers, students for the ministry, and to other benevolent purposes. He also left estates to the university of Glasgow, which at present furnish handsome exhibitions to six students for the ministry among Protestant dissenters in South Britain, who are to be nominated by his trustees. The last grand bequest in his will was for the establishment of a library in London, for the benefit of the public. Having formed this design, he purchased Dr. Bates's curious collection of books, which he added to his own, and directed his trustees to provide a proper building for their reception. Such an edifice was erected by them in Red-Cross Street, Cripplegate, where the library was opened in 1729, and admission to it is easily obtained by persons of every description, without any exception, upon application to one of the trustees. Since it was first established, very considerable additions have been made to it by legacies, as well as gifts of money and books; and it now contains upwards of 16,000 volumes, many of which are very valuable and rare, in the various departments of literature and science. The founder's works were collected together, and printed at different periods, in 6 vols. 8vo.; the last consisting of Latin versions of several of his tracts, which he directed to be published in that language for the use of foreigners.”—*Memoir prefixed to his Works.*

WILLIAMSBOROUGH, a township of the United States, in Burlington county, New Jersey. Population 619.

WILLIAMSBOROUGH, a post town of the United States, and capital of Granville county, North Carolina, on a creek which falls into the Roanoke; 36 miles north of Raleigh, 48 north-east of Hillsborough, and 56 north-west of Halifax.

WILLIAMSBURG, a post township of the United States, in Hampshire county, Massachusetts; 100 miles west of Boston. Population 1122.

WILLIAMSBURG, a post township of the United States, in Huntingdon county, Pennsylvania.—2. A post township of Talbot county, Maryland; 5 miles north-east of Easton.

WILLIAMSBURG, a post town of the United States, and capital of Clermont county; 30 miles east-north-east of Cincinnati.

WILLIAMSBURG, a borough of the United States, in James county, Virginia. It is situated between two rivulets, one of which flows into York, and the other into James river. It is regularly laid out, and was formerly the metropolis of the state; 12 miles west of Yorktown, and 55 east-by-south of Richmond. Lat. 37. 16. N. long. 76. 55. W. Population 1500.

WILLIAMSBURG, a post town of the United States, in Mason county, Kentucky.

WILLIAMSBURG, a district of the United States, in the north-east part of South Carolina. Population 6871, besides 4518 slaves.—2. A post town and capital of Williamsburg district; 72 miles north-north-east of Charleston.—3. A village of Jackson county, Tennessee, on the north side of the Cumberland, about 15 miles east-north-east of Carthage. Six miles north-east of this village there is a valuable salt spring, where large quantities of salt are made.

WILLIAMSBURG, or **JONESTOWN**, a post township of the United States, in Dauphin county, Pennsylvania, at the junction of the Swatara and Little Swatara; 23 miles east-north-east of Harrisburg.

WILLIAMSCOT, or **WILLESCOT**, a hamlet of England, in Oxfordshire; 3½ miles north-north-east of Banbury.

VOL. XXIV. No. 1664.

WILLIAMSFIELD, a post town of the United States, in Ashtabula county, Ohio.

WILLIAMSON, a post township of the United States, in Ontario county, New York, on the south side of Lake Ontario; 20 miles north of Canandaigua. Population 1139.

WILLIAMSON, a county of the United States, in West Tennessee. Population 13,153, besides 3985 slaves.

WILLIAMSPORT, a borough of the United States, and capital of Lycoming county, Pennsylvania, on the west branch of the Susquehanna; 38 miles above Northumberland. Population 344.

WILLIAMSPORT, a post township of the United States, in Washington county, Maryland, on the Potomac; 6 miles west of Elizabeth town.

WILLIAMSTADT, a town of the Netherlands, in North Brabant, on the arm of the sea called the Hollards-diep. It is strongly fortified, and has a good harbour. It was built in 1584, by order of William I., prince of Orange. In 1793, it was besieged by the French, but without success; 12 miles south-west of Dort. Population 1300.

WILLIAMSTHORPE, a hamlet of England, in the parish of North Wingfield, Derbyshire.

WILLIAMSTON, a post town of the United States, and capital of Martin county, North Carolina, on the Roanoke; 50 miles south-east of Halifax. Population 300.

WILLIAMSTOWN, a post township of the United States, in Orange county, Vermont. Population 1353.

WILLIAMSTOWN, a post township of the United States, in Berkshire county, Massachusetts, in the north-west corner of the state. William's college, which was founded in 1793, and is a respectable and flourishing seminary, is situated within this township; 135 miles west-by-north of Boston. Lat. 42. 38. N. long. 73. 15. W. Population 1843.

WILLIAMSTOWN, a post township of the United States, in Oswego county, New York. Population 563.—2. A township of Montgomery county, Pennsylvania. Population 1243.—3. A post township of Lancaster county, Pennsylvania.

WILLIAMSVILLE, a post village of the United States, in Buffalo county, New York; 11 miles north-east of Buffalo.—2. A post village of Person county, North Carolina.

WILLICHIA [so named by Mutis, in honour of *Christ. Lud. Willich*, physician at Nordheim], in Botany, a genus of the class triandria, order monogynia.—Generic Character. Calyx: perianth one-leafed, four-cleft, permanent; segments ovate, acute, spreading. Corolla one-petalled, wheel-shaped, twice as long as the calyx; tube scarcely any; border four-cleft, flat; segments roundish, convex. Stamina: filaments three, inserted into the divisions of the border, except the lowest, and shorter than it. Anthers roundish, erect, two-celled. Pistil: germ superior, roundish, compressed. Style filiform, length of the stamens, declined at the lowest division of the border. Stigma blunt. Pericarp: capsule roundish, compressed with a sharp edge, two-celled, two-valved; partition opposite. Seeds many, roundish, minute. Receptacle globular of two hemispheres.—*Essential Character.* Calyx four-cleft. Corolla four-cleft. Capsule two-celled, many-seeded.

Willichia repens.—Root annual, fibrous. Stem creeping, filiform, branched, herbaceous, hirsute, about two feet high. Leaves alternate, petioled, somewhat remote, orbicular, subpeltate, crenate, an inch long, hirsute, reddish beneath. Petioles very long, hirsute, thick. Peduncles axillary, in pairs, one-flowered, filiform, hirsute, length of the petioles. Flowers small, rose-coloured, with an hirsute calyx.—Found in Mexico.

WILLIEN, a parish of England, in Hertfordshire; 3 miles east-by-north of Hitchin.

WILLIG, a large village of the Prussian province of Cleves and Berg, near Crevelt.

WILLING, *adj.* Inclined to any thing; consenting; not disposed to refuse.

Some other able, and as *willing*, pays

The rigid satisfaction.

Milton.
Pleased;

Pleased; desirous.—He stoop'd with weary wings and *willing* feet. *Milton*—Favourable; well disposed to any thing.—As many as were *willing* hearted brought bracelets and ear-rings. *Ex.*—Ready; complying.—We've *willing* dames enough. *Shakspeare*.—Chosen.

They're held with his melodious harmony,
In *willing* chains, and sweet captivity.

Milton.

Spontaneous.

Forbear, if thou hast pity,
These groans proceed not from a senseless plant,
No spouts of blood run *willing* from a tree.

Dryden.

Consenting.—How can hearts not free serve *willing* ?
Milton.

WILLING'S CREEK, a river of the United States, in Mississippi, which runs into the Mississippi. Lat. 30. 49. N. long. 91. 21. W.

WILLINGALE, DOE, or WILLINGEHALL DE OU, a parish of England, in Essex; $4\frac{1}{2}$ miles north-east of Chippling Ongar.

WILLINGALE, SPAIN, or WILLINGEHALL DE ISPANIA, another parish in the above county, adjoining the foregoing.

WILLINGBOROUGH, a post township of the United States, in Susquehanna county, Pennsylvania. Population 351.—2. A township of Burlington county, New Jersey, on the Delaware.

WILLINGDON, a parish of England, in Sussex; 2 miles north-by-west of East Bourne.

WILLINGHAM, or WIVELINGHAM, a parish of England, in Cambridgeshire; $8\frac{1}{2}$ miles north-west of Cambridge. Population 972.

WILLINGHAM, a hamlet of England, in Cambridgeshire; $5\frac{1}{2}$ miles south-by-east of Newmarket.—2. A parish in Lincolnshire; 6 miles south-east of Gainsborough.—3. A parish in Suffolk; $4\frac{1}{2}$ miles south of Beccles.

WILLINGHAM, CHERRY, a parish of England, in Lincolnshire; 3 miles east-by-north of Lincoln.

WILLINGHAM, NORTH, a parish in the above county; 4 miles east-by-south of Market Raisen.

WILLINGHAM, SOUTH, another parish in Lincolnshire; 5 miles east-north-east of Wragby.

WILLINGLY, *adv.* With one's own consent; without dislike; without reluctance.

I dare not make myself so guilty,
To give up *willingly* that noble title
Your master wed me to.

Shakspeare.

By one's own desire.—The condition of that people is not so much to be envied as some would *willingly* represent it. *Addison.*

WILLINGNESS, *s.* Consent; freedom from reluctance; ready compliance.

For never yet a generous mind did gain;
We yield on parley; but are storm'd in vain;
Constraint, in all things, makes the pleasure less,
Sweet is the love which comes with *willingness*.

Dryden.

WILLINGTON, a parish of England, in Bedfordshire; 4 miles east of Bedford.—2. A township in Cheshire; 3 miles north-north-west of Tarporley.—3. A parish in Derbyshire; 7 miles south-west of Derby.—4. A township in Durham; 4 miles north of Bishop Auckland.—5. A township in Northumberland; 3 miles west-by-north of North Shields.—6. A township in Warwickshire, near Shipston-upon-Stour.—7. A township of the United States, in Tolland county, Connecticut; 7 miles east of Tolland. Population 1161.—8. A post village of Abbeville district, South Carolina; 5 miles east-south-east of Vienna. Here is an academy.

WILLINK, a post township of the United States, in Niagara county, New York, on the east end of Lake Erie; 15 miles south of Buffalo. Population 2028.

WILLIS (Brown), an eminent antiquary, the grandson of Dr. Willis, a celebrated physician, was born at Blandford in 1682, and was removed from Westminster-school in the

year 1690 to Oxford, where he was admitted a gentleman-commoner of Christ-church; and after leaving the university he prosecuted his studies for three years under Dr. Wotton. When he came into possession of the family estate, he was returned, in 1705, as a representative for the town of Buckingham. In 1715 and 1716 he published two parts of a work, intitled "Notitia Parliamentaria; or a History of the Counties, Cities, and Boroughs in England and Wales, with Lists of all the Knights, Citizens, and Burgesses," 8vo., to which, in 1750, he added a third part, being an appendage to the journals of the house of commons, then printed. On the revival of the Society of Antiquaries in 1717, he was chosen a member; and he sustained his reputation as an antiquary by various writings, among which are, "Surveys of the Four Welsh Cathedrals;" "History of the United Parliamentary Abbeys and Conventional Cathedral Churches;" "Survey of the Cathedrals of England, with Parochiale Anglicanum," 3 vols. 4to.; "History and Antiquities of Buckingham." In 1723 he received, in consideration of his literary merit, from the university of Oxford, the degree of A. M. by diploma. He possessed a fine cabinet of English coins, which in 1741 he presented to the university of Oxford; the university, in consideration of his family, liberally paying for those of gold by weight, and conferring upon him the degree of LL. D. He died in 1760, in the 78th year of his age. *Biog. Brit.*

WILLIS (Thomas), an eminent physician, was born in 1621-2, at Great Bedwin, in Wiltshire; and in 1636 admitted into Christ-church college, Oxford, where he took the usual degree with a view to the clerical profession. But he changed his purpose, and studied physic, taking his bachelor's degree in 1646, and commencing medical practice at Oxford. He distinguished himself by his steady attachment to the church of England, and also by his love of science, so that he became one of the first members of that philosophical society at Oxford, which laid the foundation of the Royal Society of London. As a chemist, which was the character under which he was ambitious of excelling, he published, in 1659, a work intitled "Diatribæ duæ; prior agit de Fermentatione, altera de Febribus. His accessit Dissertatio epistolica de Urinis." The recompence of his attachment to the cause of episcopacy and loyalty was the Sedelian professorship of natural philosophy at Oxford, conferred upon him after the Restoration, by the recommendation of archbishop Sheldon, soon after which he received the degree of doctor. Upon the establishment of the Royal Society, he was one of its first members. In the year 1664, when he is said to have discovered, and brought into use, the mineral water of Astrop in Northamptonshire, he published his "Cerebri Anatome; cui accessit Nervorum Descriptio et Usus." This work, on which his reputation principally depends, was followed, in 1667, by his "Pathologia Cerebri et Nervosi Generis, in qua agit de Morbis convulsivis, et de Scorbuto." Before this year he was settled in London, and being nominated a physician in ordinary to the king, was advancing to the first rank in practice. His next publication was intitled "Affectio-num quæ dicuntur Hystericæ et Hypochondriacæ Pathologia Spasmodica, vindicata contra responsionem epistolarem Nath. Highmori. Cui accesserunt Exercitationes Medico-Physicæ de Sanguinis Accensione, et Motu Musculari," 1670. On occasion of the loss of his wife, a daughter of dean Fell, he amused himself by writing his work "De Anima Brutorum quæ Hominis Vitalis ac Sensitiva est; Exercitationes duæ," 1672, in which he considers the soul of brutes as the same with the vital principle in man, corporeal in its nature and perishing with the body. After his second marriage, he began to print, in 1673, his "Pharmaceutice Rationalis, sive Diatriba de Medicamentorum Operationibus in Humano Corpore;" but he did not live to publish this work, as he was carried off by a pleurisy in 1675, at the premature age of 54, in the full vigour of his faculties and zenith of his reputation. Dr. Willis had no powers for appearing with advantage and brilliancy in society; but he was intent on science and practice, frugal, pious, and charitable. His works engaged great attention

attention on their first publication; but in consequence of modern improvements, they have sunk in the public estimation, though they are not altogether neglected. They are written in a rich and elegant Latin style.—*Haller. Biog. Brit.*

WILLIS' CREEK, a river of the United States, in Virginia, which runs into the James river. Lat. 37. 40. N. long. 78. 18. W.

WILLIS MOUNTAIN, a mountain of the United States, in Buckingham county, Virginia; 42 miles south of Charlottesville.

WILLISAU, a town of Switzerland, in the canton of Lucerne, on the Wigger; 15 miles west of Lucerne. Population 700.

WILLISHAM, a parish of England, in Suffolk; 3 miles south-south-west of Needham.

WILLISTON, a post township of the United States, in Chittenden county, Vermont; 8 miles east-south-east of Burlington. Population 1195.

WILLISTOWN, a township of the United States, in Chester county, Pennsylvania. Population 1175.

WILLTOFT, a township of England, in Yorkshire; 5 miles north-by-west of Howden.

WILLTON, a hamlet of England, in Somersetshire, near Wiveliscombe.

WILLMANSTRAND, or **LAPPERANDA**, a small town of European Russia, in Finland, almost completely surrounded by the lake called Lapwesi; 120 miles north-west of Petersburg.

WILLOUGHBY, a village and parish of England, in Warwickshire, situated on the Grand Junction canal, near the conflux of the rivers Leame and Avon. Many Roman antiquities have been dug up in the neighbourhood. Fair on Whit-Monday and Tuesday; 14 miles south-east of Coventry, and 77 north-west of London.—2. A parish of England, in Lincolnshire; 3 miles south-south-east of Alford. Population 456.

WILLOUGHBY, CAPE, the eastern point of Kangaroo island, on the south coast of New Holland. Lat. 35. 48. S. long. 138. 13. E.

WILLOUGHBY LAKE, a lake of the United States, in Essex county, Vermont.

WILLOUGHBY, SOUTH, a parish of England, in Lincolnshire; 5 miles north-west of Folkingham.

WILLOUGHBY, SILK, another parish in the same county, near Sleaford.

WILLOUGHBY, WATERLESS or **WATER-LEYS**, a parish of England, in Leicestershire; 5½ miles north-north-east of Lutterworth.

WILLOUGHBY ON THE WOLDS, a village and parish of England, on the south borders of Nottinghamshire, near the Fosse-way, supposed to have been formerly a Roman station; 11 miles south-south-east of Nottingham.

WILLOUGHTON, a parish of England, in Lincolnshire; 8 miles east-by-north of Gainsborough.

WILLOW, *s.* [*pelie*, Saxon; *salix*, Lat.; *gwilou*, Welsh.] A tree: of the boughs of which a garland was said to be worn by forlorn lovers.—It hath amentaceous flowers consisting of several stamina, which are collected into a spike, but are barren. The embryos are produced upon different trees from the male flowers, and afterwards become a fruit or husk, shaped like a cone, opening in two parts, and containing downy seeds. *Miller.*

In such a night

Stood Dido with a *willow* in her hand

Upon the wild sea-banks.

Shakspeare.

WILLOW GROVE, a post village of the United States, in Montgomery county, Pennsylvania.—2. Of Sumpter district, South Carolina.

WILLOWBECK, a small river of England, in Yorkshire, which runs into the Swale.

WILLOWED, *adj.* Abounding with willows.

Lo, thy streams are stain'd with gore,

Many a brave and noble captain

Floats along thy *willow'd* shore.

Bp. Percy.

WILLOWISH, *adj.* Resembling the colour of willow.—Make his body with greenish coloured crewel, or *willowish* colour. *Walton.*

WILLOW-WEED, *s.* [*lysimachia*, Lat.] A plant.

WILLOW-WORT, *s.* A plant. *Miller.*

WILLOWY, *adj.* Abounding with willows.

Ye brown o'er-arching groves,

That contemplation loves,

Where *willowy* Camus lingers with delight!

Gray.

WILLS, a township of the United States, in Guernsey county, Ohio. Population 659.

WILLSBOROUGH, a post township of the United States in Essex county, New York, on Lake Champlain, south of Chesterfield. Population 663.

WILLSTEDT, a small town of Germany, in Baden, near the Kintzig. Population 1200.

WILLSWORTHY, a hamlet of England, in Devonshire; 7 miles north-east of Tavistock.

WILLOUGHBEIA [so named in memory of *Francis Willughby*, Esq. F.R.S., the friend and pupil of Ray], in Botany, a genus of the class pentandria, order monogynia, natural order of contortæ apocineæ (*Juss.*)—Generic Character. Calyx: perianth one-leaved, five-parted, acute, fleshy, very small. Corolla one-petalled, salver-shaped; tube wider at the base, cylindrical; border five-parted, flat; segments oblique, acute, more gibbous on one side, waved, imbricate at the base. Stamina: filaments five, very short, inserted into the tube above the base. Anthers sagittate. Pistil: germ roundish, superior. Style four-cornered. Stigma thick, ovate-headed, striated, two-cusped, placed on a flat ring. Pericarp: berry ovate, one or two-celled. Seeds numerous, angular, nestling in pulp, or fastened to the partition.—*Essential Character.* Contorted. Corolla salver-shaped. Stigma headed. Fruit a one or two-celled berry or pumpkin.

1. *Willughbeia acida*.—Stem erect, flowers axillary, fruit two-celled. This is a tree seven or eight feet in height, and seven or eight inches in diameter, with a gray bark and a white loose wood; it spreads at top into many straight knotted branches. Leaves opposite, ovate, smooth, on short, half-embracing petioles.—Native of Cayenne and Guiana.

2. *Willughbeia scandens*.—Stem climbing, racemes tendrill-shaped, fruit one-celled.—Native of Guiana.

WILLOUGHBY (Francis), was born in 1635 of a good family in Lincolnshire, and educated in Trinity college, Cambridge, under the tuition and in habits of friendly intercourse with the excellent philosopher and natural historian, John Ray. They were intimate associates, and made a foreign tour together in the years 1663 and 1664. To birds and fishes Willughby paid particular attention, and he formed a rich museum of animal and fossile productions. In 1668 he married the daughter of Sir Henry Bernard, and his family residence at Middleton, in Warwickshire, was the place of Ray's frequent resort, where he and his host prosecuted their philosophical experiments and observations, the result of which they communicated to the Royal Society, of which they were both members. This instructive and pleasant intercourse was, however, prematurely interrupted by the death of Willughby in 1672, at the age of 37. His confidence in Mr. Ray was manifested by appointing him one of his executors, and committing to him the charge of educating his two infant sons, bequeathing to him an annuity for life as a compensation. Ray ascribes to him, without any trace of adulation, singular moral excellence and high mental endowments. His posthumous work, published under the inspection of Mr. Ray, was entitled "*Francisci Willughbeii Arm. Ornithologiæ Libri tres; in quibus Aves omnes hactenus cognitæ, in methodum naturis suis convenientem reductæ, accuratè describuntur. Descriptiones iconibus elegantissimis et vivarum avium simillimis æri incisus illustrantur. Totum opus recognovit, digessit, supplevit Johannes Raius.*" Lond. fol. This work was also translated into English by Ray, and published in 1671 with large additions,

ditions. Mr. Ray also collected and arranged Willughby's papers on Ichthyology. He added the two first books, and with the assistance of the Royal Society published them in 1686 under the following title: "Fran. Willughbeii Arm. de Historia Piscium, Libr. quatuor, jussu et sumptu Soc. Regiæ Lond. editi. Totum opus recognovit, coaptavit, supplavit librum etiam primum et secundum integros adject J. Raius." Oxon. fol. The papers of Willughby in the Phil. Trans. relate to vegetation, plants, and insects. The collection of Ray contains some of his letters. *Biog. Brit. Pulteney's Sketches of Botany.*

WILLY, a river of England, in Wiltshire, which rises near Warminster, and being joined by the Nadder, runs into the Upper Avon, near Salisbury.

WILMINGTON, a parish of England, in Kent, near Dartford. Population 646.

WILMINGTON, a parish of England, in Sussex; $4\frac{1}{2}$ miles south-west of Haylsam.

WILMINGTON, a post township of the United States, in Windham county, Vermont; 21 miles east of Bennington. Population 1193.—2. A township of Middlesex county, Massachusetts; 16 miles north of Boston. Population 716.

WILMINGTON, a borough of the United States, and port of entry, in Newcastle county, Delaware, between the Brandywine and Christiana creeks, one mile above their confluence, and two west of the Delaware.

The Christiana is navigable as far as Wilmington, for vessels drawing 14 feet of water.

On the Brandywine, separated at a little distance from the body of the town, there is a village of about 100 houses, nearly one-half of which are included within the borough; and 14 flour-mills, the finest collection in the United States. The Brandywine and the Christiana, with their branches, afford a great number of excellent seats for mills and manufactories; 5 miles north-north-east of Newcastle, 28 south-west of Philadelphia, and 70 north-east of Baltimore. Lat. 39. 43. N. long. 77. 34. W. Population 4416.—2. A post town of the United States, and capital of Clinton county, Ohio; 50 miles west of Chillicothe, and 54 north-east of Cincinnati.—3. A post township of the United States, in Fluvanna county, Virginia.—4. A post town and port of entry of the United States, and capital of New Hanover county, North Carolina, on the east side of Cape Fear river, just below the confluence of the north-east and north-west branches, about 35 miles from the sea; 90 miles south-east of Fayetteville. Lat. 34. 11. N. long. 78. 10. W.—4. An island of the United States, near the coast of Georgia, at the mouth of the Savannah. Lat. 32. N. long. 81. 6. W.

WILMOT (John), earl of Rochester, was the son of Henry, earl of Rochester, an eminent loyalist in the reign of Charles I., and was born in 1647, at Ditchley, in Oxfordshire. In 1659 he was entered at Wadham college, Oxford, and afterwards travelled into France and Italy under a tutor, who is said to have reclaimed him from his early licentiousness; but upon his return to the profligate court of Charles II., in which he was a gentleman of the bed-chamber, he relapsed into his former intemperance. In 1665 he went to sea, and, as it is said, behaved with great intrepidity in the attack of a castle at Bergen, in Norway, which character for courage he also maintained when he afterwards served under Sir Edward Spragge. In some of his domestic adventures, however, he forfeited this kind of reputation. Welcomed in all companies on account of his wit and vivacity, he became habitually intemperate, insomuch that, on a subsequent review of his conduct, he acknowledged that for five successive years he was never free from the inflaming effects of wine. His various adventures, in his real, or in a disguised character, have furnished many anecdotes, that have been circulated in conversation, or in books of mere amusement, but which are not worth recording in graver publications. His wit furnished in the societies which he frequented a kind of apology for his profaneness and licentiousness; and as for his poetical compositions, they were for the most part lampoons or amatory effusions, the titles of which would stain the page of biography. "In all his works, (says Dr. Johnson,

meaning probably those which can be read), there is sprightliness and vigour, and every where may be found tokens of a mind which study might have carried to excellence." The justice of Walpole's sentence, in his "Catalogue of Noble Authors," will be generally allowed: "Lord Rochester's poems have much more obscenity than wit, more wit than poetry, more poetry than politeness." His course of debauchery was of no long duration; for soon after the age of 30 he sunk into a state of debility and disease, which induced him to study physic, and this study permitted him to reflect on the course of his past life, the irremediable effects of which he learnt from experience. Towards the close of his short life, he became acquainted with bishop Burnet, who convinced him of the truth both of natural and revealed religion, and his mind was then impressed to such a degree, that he is said to have become a sincere penitent. His life terminated in July, 1680, soon after he had commenced his 33d year. He left a son and two daughters.

WILMOT, a township of the United States, in Hillsborough county, New Hampshire; 29 miles north-west of Concord.

WILMOTSHAM, a hamlet of England, in the parish of Stoke Pero, Somersetshire.

WILMSLOW, or WIMBOLDSHEY, a parish of England, in Cheshire; 7 miles north-west of Macclesfield.

WILMSTORF, OLD, a village of Prussian Silesia, in the county of Glatz, with 900 inhabitants.

WILNA, an extensive province or government of the north-west of European Russia, containing the north part of Lithuania. It extends from 53. 40. to 56. 15. of N. lat.; has an area of 2300 square miles; and a population of 1,000,000. These are composed of Lithuanians, Poles, Lettonians, and descendants of German settlers: the prevailing creeds are those of the Catholics or of the Greek church. The surface, similar to that of Poland and the adjacent part of Russia, is in general flat, covered in various districts with wood, in others with marshes and lakes. The winter partakes of the severity of the Russian climate; the heat of summer is greater than in England. The towns are small, and thinly scattered. The inhabitants live in the country, employed in tillage, grazing, or hunting. The trade, such as it is, is carried on by the Jews. The principal rivers are the Niemen, the Vilia, the Pripez, and the Narew. See *Samogitia* and *Lithuania*.—2. A city of Russian Lithuania, the chief town formerly of a palatinate, at present of a province or government. It is situated in a hilly country, and occupies several eminences near the river Vilia or Vilna. Its circuit is nearly four miles; its population, amounting in 1788, to 21,000, is now nearly 30,000. Like other towns in Poland and Russia, it is built chiefly of wood, very deficient in cleanliness, and exhibits a striking contrast of wretchedness in some buildings, and tawdry magnificence in others. The inhabitants are a mixture of Catholics, Jews, and followers of the Greek church; but all live in harmony as far as regards religious feelings. The trade of the place consists in the export of corn, hemp, flax, honey, wax, and other products of the surrounding country. These are sent by the Vilia and the Niemen (into which the former falls), to Königsberg or Memel; and the trade is managed entirely by Jews. Wilna is the see of a Greek metropolitan and a Catholic bishop. Its university, established in 1570, was new modelled by the Russian government in 1803. The objects of tuition are the classics, the natural and moral sciences, literature, and, in some degree, the fine arts. The number of professors is 32; the number of assistants, 12. Connected with the establishment is an observatory and several libraries. The farther appendages of a seat of learning, such as the cabinet of natural history, the chemical laboratory, the botanical garden, the collection of animals, are as yet in their infancy. The collection of minerals is more complete. The university possesses several important privileges; in particular, a jurisdiction over the establishments for education through a large tract of country. Its regular income is 60000*l.* a year; a limited number of students are maintained at the expense of the crown. There are in Wilna also a gymnasium or classical school, a seminary for

for the education of the Catholic clergy, another for those of the Greek church, and an institution for youths of good family; 400 miles south-south-west of Petersburg, and 195 east of Königsberg. Lat. 54. 41. 2. N. long. 25. 17. 27. E.—3. A post township of the United States, in Jefferson county, New York.

WILNE, GREAT and LITTLE, adjoining townships of England, in Derbyshire; 7½ miles south-east of Derby.

WILNECOTE, a parish of England, in Warwickshire; 2½ miles south-east of Tamworth. Population 502.

WILNIS, or WILLIS, a village of the Netherlands, in the province of Utrecht, with 800 inhabitants; 7 miles north of Woerden.

WILPESHIRE, a township of England, in Lancashire, near Blackburn.

WILSDEN, a township of England, West Riding of Yorkshire; 4 miles south-east of Keighley. Population 1121.

WILSDORF, a town of Germany, in Saxony; 9 miles west of Dresden. Population 1300.

WILSFORD, or WIVELSFORD, a parish of England, in Lincolnshire; 4 miles west-south-west of Sleaford.—2. A parish of Wiltshire; 2 miles south-west of Amesbury.

WILSICK, a hamlet of England, West Riding of Yorkshire; 6½ miles south-by-west of Doncaster.

WILSNACK, a town of Prussia, in the province of Brandenburg; 63 miles west-north-west of Berlin. Population 1400.

WILSOME, *adj.* Obstinate; stubborn. A forgotten old word, but as proper as *humoursome*, and the like. It is in the Prompt. Parv. which has also *wilsomeness* or *wylsomenesse* for obstinacy.

WILSON (Richard), the most eminent landscape-painter of the English school, was the son of a clergyman, and was born at Pineges, in Montgomeryshire, in 1714.

Having received from his father a good classical education, in the course of which he had evinced a decided disposition for drawing, he was sent to London at the age of 15, and placed as a disciple with an obscure portrait-painter, named Wright. After a lapse of six years, he commenced professor, and, under the patronage of Dr. Hayter, bishop of Norwich, he soon afterwards had the honour to paint portraits of his late majesty and his brother, the duke of York; both at that time under the tuition of the bishop. He continued to practise portrait-painting some time in London, but with no great success, and at length went to Italy to cultivate his taste. Even there he continued to practise it, still unacquainted with the genuine bias of his genius, although occasionally exercising his talents and employing his time in studies of landscape. At Venice Wilson painted a portrait of the late Mr. Lock, of Norbury-park, one of the most creditable of his performances in that branch of the art; and it was there that accident opened his eyes to his own peculiar gratifications, and led him into that path, by pursuing which he has obtained a name among the worthiest in art.

As a matter of relaxation and amusement, he had painted a landscape, which being seen by Zuccarelli, so warmly excited that eminent artist's admiration, that he advised Wilson to pursue that line of art exclusively. From this time it is believed that he abandoned portraiture, and followed the judicious advice of a rival artist; and soon after he left Venice in company with Mr. Lock, and travelling slowly to Rome, made numerous studies on the way, which are still preserved at Norbury-park. On his arrival at Rome, the advice of Zuccarelli was confirmed by Vernet and Mengs, both then in high repute. So much were they delighted with Wilson's landscapes, that they each offered to exchange a picture with him; a proposal far too flattering for refusal. This liberality, as commendable as it is unusual, was followed by Vernet in the handsomest manner, as he hung the picture by the Englishman, in his exhibition-room, and recommended him to the particular attention of the cognoscenti.

His progress in landscape-painting must have been very rapid; indeed it must have had the character of being almost

intuitive, since he obtained a very great degree of reputation during his stay in Italy, and painted many pictures there of known celebrity. He travelled with the late earl of Dartmouth to Naples, and made a number of very fine drawings for that nobleman, now preserved by his grandson; and for him also he painted two pictures, one a very fine one, a view of Rome, which has been beautifully engraved by Middiman. He was also employed by the late duke of Bridgewater to paint a landscape with the story of Niobe; but his grace had the bad taste to employ Placido Constanza to repaint the figures. To preserve his reputation, Wilson painted another of the same subject, and both are now in England. He returned from Italy in 1755, and occupied apartments over the north piazza of Covent-Garden. He had merited, and here he also obtained celebrity, and for a while employment. Many of his principal performances appear to have been painted about this time, most of which are known by the fine prints engraved from them by Woollett and others; in which the grandeur, breadth, and purity of composition in mass and in line, contend for admiration with the talents conspicuous in the engravings.

Hitherto the life of Wilson was honoured as his talents deserved; the remainder of it exhibited a gradual declension, not so much of power as of patronage. 'Tis true he was often too free in his pencil, and too much mannered in his style; repeating himself, perhaps, till it became irksome: 'tis said, also, that he was not of the most tractable humour, and was low in his pursuits and associations. Whencever it arose, he was doomed to undergo indifference and neglect, and consequently the inconveniences of lowness of purse. Sometimes he was employed to paint views of gentlemen's seats, but probably the occupation suited the artist as little as the result gratified the patron. Wilson's view of nature was far too broad for suitable adaptation to such a purpose, and consequently there are not many pictures of this class to be met with which have proceeded from his pencil. The great characteristic of his works is grandeur, resulting from breadth, purity, and simplicity, united in fullness of colour and mellowness of touch. He was perfectly original in feeling and execution, more grand in general conception than Claude, though infinitely less perfect in detail; and far from travelling through his career in art, with so even a pace as his great predecessor and only rival in the more exalted style of landscape-painting before our time. Now a third shines in the same hemisphere; and Claude and Wilson find no ill-suited associate in the name of Turner.

At the institution of the Royal Academy, Wilson was chosen one of the founders; and after the death of Hayman he was made librarian. That station he retained till his death, which happened in May, 1782, in the 68th year of his age.

WILSON (Thomas), an English prelate, was born in 1663, at Burton-in-Wirral, Cheshire, and finished his education in Dublin college, where he took his degree of arts. In 1689, he was ordained priest, and in 1692 became domestic chaplain to the Earl of Derby, and attended his son, lord Strange, who was his pupil, on a tour to the continent. Upon the death of the young gentleman he returned to England, and in recompence of his faithful services, was nominated to the bishopric of the Isle of Man, by the earl of Derby, who then possessed the sovereignty of the island. The nomination was approved by king William, and he was consecrated in January, 1697-8, having received at Lambeth the degree of LL.D. The revenue of the bishopric did not amount to more than 300*l.* a year; but by some collateral advantages the bishop was enabled to exercise hospitality and charity, to repair his ruined palace, and to found a new chapel at Castletown. He also established parochial libraries, which he furnished with religious books, among which was a small tract, the first that was ever printed in the Manks language. He improved the agriculture of the island by introducing into it corn, horses, cattle, and sheep, from England; and he studied physic with a view of administering to the relief and comfort of the islanders. He published eccle-

siastical constitutions which were so much approved, that lord chancellor King said of them, that "if the ancient discipline of the church were lost, it might be found in all its purity in the Isle of Man." Bishop Wilson, chiefly with a view to the interest of religion and morality, was anxious to maintain a due regard to episcopal authority, and this anxiety led him in two instances to exceed the bounds of prudence and propriety. When some copies of the "Independent Whig" had found their way into the island, he ordered them to be seized, apprehending that they inculcated sentiments hostile to Christianity and the established church. He also involved himself in difficulties and incurred reproach by excluding from the communion the wife of the governor, on account of an act of defamation, for which she refused to ask pardon of the injured party. This led to a serious altercation with the governor, who fined both the bishop and his two vicars-general, for suspending his chaplain for disobedience in admitting the wife to communion, and who arrested them for refusing to pay the fine. Accordingly they were kept close prisoners in the castle for nine weeks, till the bishop, by application to the council in England, obtained their release. The pious and mild-tempered bishop afterwards declined prosecuting the governor for damages. From his piety and attachment to the church, he was honoured in 1707, with the degree of D.D. from the university of Oxford, in full convocation, and in which he was afterwards aggregated at Cambridge.

Such was the bishop's zeal for doing good, that he would not quit the sphere assigned him for this purpose, though he was offered an English bishopric; in reference to which circumstance queen Caroline, directing her attention to Wilson, among a number of other prelates who happened to be at court at the same time with him, said to them, "Here, my lords, comes a bishop whose errand is not to apply for a translation, nor would he part with his spouse because she is poor." His character was in such estimation with the French minister, that he procured an order that no French privateer should commit ravages on the Isle of Man. In this retired situation his life was prolonged to his 93d year, when he calmly expired in March, 1755, leaving one surviving son, known in the political world as rector of St. Stephen's, Walbrook, and patron of the celebrated historian, Mrs. Macaulay. After his death a collection of his works was published in two vols. 4to. 1781. His notes to Crutwell's Bible, which was published under the bishop's name, in three vols. 4to. 1785, are of little value. The translation of the New Testament into the Manks language, which he had undertaken, was completed by his successor, Dr. Mark Hillesley.—*Biog. Brit. Life prefixed to his Works. Gen. Biog.*

WILSON (Dr. John), a native of Feversham, in Kent, was a gentleman of Charles the First's chapel, and servant in ordinary to his majesty, in the character of chamber-musician. His instrument was the lute, upon which he is said to have excelled all the Englishmen of his time; and, according to Ant. Wood, his royal master was so pleased with his talents, and had even such a personal regard for him, that he not only listened to him with the greatest attention, but frequently condescended to lean or lay his hand on his shoulder, while he was playing.

The compositions of Dr. Wilson will certainly not bear a severe scrutiny either as to genius or knowledge. It is, however, not easy to account for the ignorance in counterpoint which is discoverable in many lutenists of these times; for having harmony under their fingers, as much as the performers on keyed instruments, it facilitates their study, and should render them deeper contrapuntists than the generality of flute-players, whose flimsy compositions are proverbial.

On the surrender of the garrison of the city of Oxford, 1646, Dr. Wilson left the university, and was received into the family of sir William Walter, of Sarsden, in Oxfordshire; but, in 1656, he was constituted music-professor, and had lodging assigned him in Baliol college, where, being assisted by some of the royalists, he lived very comfortably,

exciting in the university, according to A. Wood, such a love of music, as in a great measure accounts for that flourishing state in which it has long subsisted there, and for those numerous private music-meetings, of which this writer, in his own life, has given such an amusing relation. At the Restoration, Dr. Wilson was appointed chamber-musician to Charles II.; and, on the death of Henry Lawes, 1662, was again received into the chapel-royal, when, quitting the university, he resided constantly in London, till the time of his decease, at near 78 years of age, in 1673.—*Burney.*

WILSON, a township of the United States, in Niagara county, New York.

WILSON, a county of the United States, in West Tennessee, on the south side of the Cumberland. Population 11,952, slaves 2297.

WILSON, POINT, a cape on the west coast of North America, in the gulf of Georgia. Lat. 48. 10. N. long. 237. 31. E.

WILSON'S PROMONTORY, a remarkable projecting headland, being a lofty cape of granite, about 20 miles long and from 5 to 14 in breadth, and the southernmost point of the island of New Holland. Lat. 39. 11½. S. long. 146. 24. E.

WILSONTOWN, a village of Scotland, in Lanarkshire, in the parish of Carnwath; 23½ miles south-west of Edinburgh, and 8½ east of Lanark, erected by Messrs. Wilsons of London, to accommodate the workmen at their extensive iron foundry at this place.

WILSONVILLE, a township of the United States, in Wayne county, Pennsylvania, in the Lexawacsein; 120 miles north of Philadelphia.

WILSTER, a town of Denmark, in Holstein, near the Elbe. It has a small trade in corn and cattle, and several distilleries. The surrounding district is, from it, called Wilstermarsch; 34 miles north-west of Hamburg. Population about 1600.

WILSTER, a river of Holstein, which is properly a branch of, or separation from, the river called Cudensee. It falls into the Stor, and is navigable for small craft.

WILSTHORPE, a township of England, in Lincolnshire; 5 miles north-west of Market Deeping.—2. A hamlet in the East Riding of Yorkshire; 3 miles north-by-west of Bridlington.

WILSTON, or WILLESTHORPE, a hamlet of England, in Hertfordshire; 2 miles north-west of Tring.

WILSTON, a hamlet of England, in Leicestershire; 6½ miles north-east of Ashby-de-la-Zouch.

WILTHEN, a large village of Germany, in Saxony, situated on the borders of Lusatia, to the south of Bautzen; the scene of a battle between the French and allies, in May, 1813.

WILTON, a parish of Scotland, in Roxburghshire, lying on the banks of the Teviot, and containing 5000 acres. Population 1307.

WILTON, a borough and market town of England, in the county of Wilts, is situated in a broad and fertile valley, near the confluence of the rivers Nadder and Wily. It is a town of great antiquity, and is supposed by some writers to have been the chief seat of the British prince Carvilius, and afterwards to have constituted the capital of the West Saxon dominions. It was undoubtedly a place of consequence antecedent to the Norman conquest, and appears to have been favoured at different times by the Saxon princes. It continued for many ages after the conquest, famous for its monastic institutions, and particularly for its abbey, which was founded in 773, by Wulstan, earl of Wiltshire. This was dissolved by Henry VIII., and no portion of its buildings are now standing, though they were at one time of considerable extent and grandeur. At the free school 25 boys are clothed, educated, and allowed ten pounds when put out as apprentices. Wilton, though decayed in extent and population, as well as in importance, still retains many of its ancient privileges. It is a borough both by prescription and by charter, and is governed by a corporation of its own, consisting of a mayor, recorder, five aldermen, three capital burgesses, and eleven

eleven common-council men, with a town-clerk and other officers, as fixed by the last charter granted in the reign of Henry VIII. Wilton sends two members to parliament, and has regularly done so since the 23d year of Edward I. It is the county town of Wiltshire, and is consequently the place of assembly for the election of knights of the shire. The county courts of justice are sometimes held here. During the time of the Saxons, Wilton was the see of a bishop, created by Edward the Elder, out of the diocese of Sherborne. It has now a market on Wednesday, and its fairs are on the 4th May for cattle and sheep, and 12th September for sheep and horses. Adjoining the town is Wilton-house, the splendid and interesting seat of the earls of Pembroke. The park is extensive, finely wooded, and adorned with a lake, triumphal arches, a Palladian bridge, and other architectural ornaments; $3\frac{1}{2}$ miles west-by-north of Salisbury, and 85 west-south-west of London. Population of the borough and parish 1963.—2. A parish of England, in Norfolk; 9 miles south-by-east of Stoke Ferry.—3. A parish in Somersetshire, about 1 mile south-west of Taunton.—4. A township in the North Riding of Yorkshire; 4 miles north-west of Guisborough.—5. A township in the East Riding of Yorkshire; 4 miles east-by-south of Pickering.—6. A post township of the United States, in Kennebeck county, Maine, 200 miles north-north-east of Boston.—7. A post township of Hillsborough county, New Hampshire; 40 miles south-south-west of Concord. Population 1017.—8. A township of Fairfield county, Connecticut; 7 miles north of Norfolk. Here is an academy.—9. A township of Saratoga county, New York.

WILTON BISHOP'S, a township of England, East Riding of Yorkshire; 4 miles north-by-west of Pocklington. Population 454.

WILTOUN, a post village of the United States, in Fairfield county, Connecticut.—2. Of Williamsburg district, South Carolina.—3. A village of Charleston district, South Carolina; 27 miles west-south-west of Charleston.

WILTSHIRE, an inland county of England, bounded on the north and north-west by Gloucestershire; on the south-west by Dorsetshire; on the south and east by Hampshire; and on the north-east by the county of Berks. Its form is nearly oval; and concerning its extent and superficial area, various statements are made by different writers, some estimating its length at 39 miles from north to south, and 30 in breadth from east to west; while others, apparently on better grounds, give it 54 miles of length, and 34 of breadth. The superficial area, according to the same authority, is 1372 square miles, or 878,000 acres, of which about 160,000 are supposed to be arable, and 270,000 to be fit for pasture. Wiltshire may be said to be naturally divided into two portions, by an irregular range of hills, which extends transversely through the greater part of the county, in a direction inclining from the north-east to the south-west. These districts are usually denominated South and North Wiltshire, and differ very materially from each other, not only in appearance, but in almost every distinguishing quality. South Wiltshire, which claims priority of notice, on account of its superior extent, forms the western division of a vast tract of chalk hills, comprising a considerable part of Hampshire, and having for its boundaries the rich lands of Berkshire, and the extreme verge of the Marlborough hills on the north; the broken ground of Somersetshire on the west; the New Forest of Hampshire on the south; and the heaths of Surrey and Sussex, together with the West Downs of the latter county, on the east. This portion of Wiltshire presents to the eye, when surveyed from a distance, the appearance of a large elevated plain. On a nearer inspection, however, it appears to be indented by numerous, and frequently extensive vallies, and to display an almost continual series of gentle eminences, with now and then a bolder height rising above the others, but never to a mountainous elevation. In some parts the hills assume the form of rotund knolls, and are separated by smoothly sided hollows, which vary considerably both in depth and extent. At other places they range along for a short distance in connected ridges, shewing on

one side of the range rather a rapid declivity, from the top of which, on the other side, the hills sink in irregular gradation till at length they frequently shelve into a perfect flat. The whole of this district, generally speaking, is separated into two divisions, the one called Marlborough Downs, and the other Salisbury Downs, or Plain. Both these portions, however, are characterised by precisely the same generic features, excepting, perhaps, that the eminences in the former are more abrupt and elevated than in the latter. Around Stonehenge, the greatest level prevails, and the face of the country here flows in the most gentle manner, and exhibits a tamer aspect than even the high wolds of Yorkshire. Throughout this whole extent, the surface is usually smooth and naked; but nevertheless beautiful. Many of the scenes are grand; and at particular seasons, or under the influence of peculiar effects of sky, cannot fail to delight the artist. The principal vallies in this division of the county lie along the banks of the rivers, the most remarkable of which diverge like irregular radii from the country around Salisbury and Wilton. These display rich meadow and corn lands, interspersed with seats and villages, and finely covered, at intervals, with plantations of wood.

North Wiltshire differs completely from the southern division of the county in its general appearance. Instead of a constant series of "chalky waves," the aspect of this district, which extends from the verge of the Downs to the hills of Gloucestershire, is nearly that of a perfect flat, the few deviations from the ordinary level being for the most part so gradual, as scarcely to be perceptible on a cursory view. The country here, moreover, is so extremely close, and well wooded, that when viewed from any of the surrounding hills, it appears like one vast plantation of trees. If examined in detail, however, it is found also to contain many extensive tracts of rich pasture land, situated on the banks of the Lower Avon and the Thames, and of such smaller streams as flow into the one or the other of these rivers. It likewise comprises a number of corn fields, exhibits some very fine scenery of the milder kind, and is abundantly supplied with towns and villages. The soil of this county is various, both in the southern and in the northern districts. In the former, however, a much greater uniformity of disposition is observable than in the latter. All the higher land, on the sides of the hills, from which the flints have been washed off, exhibits very commonly a chalky loam, or rather a dissolved chalk. A flinty loam chiefly forms the soil of the lower grounds of these summits; and in the centre of the vallies, which are watered by rivulets, the soil is usually composed of a deep black earth, covering a bed of broken flints; but in some of the more extensive vales there are veins of peat, formed by black earth, without any mixture of flints. The white land prevails most near the sources of the rivulets, where the hills are steepest; and the flinty loams near the junction of the rivulets, where the country is flattest. On those hills, the sides of which are much washed, the soil is of course extremely thin and weak; and, on the contrary, the level tops, which have been little, if at all washed, frequently possess a very strong and deep soil. Some stiff clays and clayey loams are discovered in different spots on the skirts of this district; and its interior is intersected by several stripes of a sandy soil, following the course of the veins of sand-stone already mentioned. One stripe, which is very narrow, but very fertile, entering the county in the vicinity of Mere, runs by Maiden-Bradley, Warminster, Westbury, and Lavington, towards Devizes, where it meets and unites with a wider and still more fertile tract of similar soil, which stretches through the vale of Pewsey, and terminates at Burbage. From Shaftesbury, in Dorsetshire, another stripe proceeds by Donhead, Ansty, Swallowcliffe, and Fovant, till it is stopped by the high ground in Burcomb field. This vein is likewise met at or near Fovant, by the range of sand hills coming from West Knoyle, by Stop-Beacon and Ridge. In North Wiltshire, the soil, covering the extensive tracts of corne-grate, under strata, is chiefly a calcareous loam of a reddish colour, and contains a considerable mixture of irregular

gular flat stones. This loam differs much in quality, according to its comparative distance from the rock, and to the absence or presence of an intervening layer of cold blue clay; which, particularly when situated near the surface, renders the soil much less fertile than when it lies upon the pure warm stone, as is the case with all the land extending from Chippenham southward through Melksham and Trowbridge, except where the veins of gravel above mentioned interrupt the course of the rock. In that event, however, the soil is not deteriorated; but, on the contrary, is much improved. Of the sand veins in this district, one runs from Rodburn, by Seagry, Draycot, and Sutton-Benger, to Langley-Burrel, near Chippenham; and another from Charlcot, through Bremhill, to Branham. Detached masses of the same soil are likewise seen at Rowde and Seend; and there is a third very narrow stripe of it stretching also from Charlcot towards Swindon. Another soil in North Wiltshire, which seems to demand particular notice, is that extending over the greater part of Brandon Forest: it is a cold iron clay of the very worst quality; so that the ground here was never so well applied as when in its original state of woodland. The climate of this county is not characterised by any very peculiar quality, except that the air in South Wiltshire, as on all open downs, is generally cold and sharp. Hence that district, though highly favourable to the health both of men and beasts, is not very congenial to agricultural purposes. In North Wiltshire the climate is much milder than in the south parts; but is nevertheless likewise cold; at least winter lingers here longer than might be supposed; a consequence most probably of the chilly retentive nature of the under soil throughout the greater part of it.

With regard to agriculture, the southern district may almost be regarded as one vast sheep farm. Fallowing is in very general use; and the chief manure is the produce of the sheep-fold. The most general crops on the high white lands are wheat and barley, and on the grounds, in the vallies, green crops for the winter maintenance of the sheep and cattle. Potatoes are likewise planted in considerable quantities on the sandy veins which run through the county in this division. On the meadow lands, irrigation is practised perhaps more extensively here than in any county of England, and with signal advantages. Indeed, water meadows are indispensable appendages to a South Wiltshire farm; as without them it would be almost impossible to pursue the present system of sheep breeding, which is certainly more profitable to the farmer, to his landlord, and to the country at large, than any other mode of agriculture that could be substituted in its stead. The distinguishing feature of the agriculture of North Wiltshire is the pasturage or grazing system. Great numbers of cows are therefore kept in that district, and a considerable part of them are likewise reared in it. The cheese of North Wiltshire has long been deservedly famed; though for some time after it became the staple commodity here, it was sold in the London market as the manufacture of Gloucestershire. Now, however, much of it is well known under the appellation of the "North Wiltshire," and is very generally esteemed superior to the cheese of the adjoining county, being equally rich as the best sort of the vale of Berkeley, and free from that degree of pungency, or sharpness, which is so offensive to some palates. In all things relative to the dairy, indeed, the inhabitants of this district probably excel those of any part of England, and evince that the quality of its produce depends fully as much on proper management as on any peculiarity of situation, soil, or climate; as it is well known that few tracts of country vary more, in these circumstances, than the different portions of North Wiltshire; and yet the cheese is almost equally good throughout its whole extent. But though the principal part of the pasture lands in this district is devoted to the purposes of the dairy, a considerable portion of them is also appropriated to grazing cattle for sale. Pigs are also reared in vast numbers in different parts of the county, and particularly constitute essential appendages to the dairy farms of its northern division. Many of these animals are sold alive to the

butchers, for the supply of the neighbouring towns with pork; but the far greater proportion of them are killed by the farmers themselves, and cured as bacon. The last article of Wiltshire produce is no less celebrated than its cheese, at least when the pig has been principally bred on the wley and ofal of the dairy; and has received a mixture of barley-meal as fattening food.

Chalk undoubtedly forms the chief part of the substructure of all that extensive assemblage of hills which constitute the Downs. On the western side of the county, bordering on Somersetshire, are many freestone quarries, where vast quantities of fine stone are obtained. The quarries at Box, near Bath, are as famous as any in the vicinity of that city. The principal rivers in Wiltshire are the Thames, the Upper and Lower Avon, the Bourn, the Wily, the Nadder, and the Kennet. The canals which intersect the county of Wilts are the Thames and Severn canal. The Kennet and Avon canal, intended to connect the navigation of these two rivers.

The manufactures of Wiltshire are various, and of great extent. Salisbury is noted for its flannels and fancy woollens; and, besides, carries on a considerable manufactory of cutlery and steel goods, which are probably superior in workmanship to any in the kingdom.

Wiltshire abounds in the most curious and interesting remains of antiquity. Of these the most remarkable are the stupendous monuments at Avebury and Stonehenge, both of which are commonly regarded as Druidical temples. Next to these immense temples, because resembling them in relative magnitude, though totally dissimilar in kind, the Wansdyke may properly claim attention. Of nearly equal antiquity to the monuments already named, are the artificial hillocks, or mounds of earth, called Barrows or Tumuli, which abound in this county. There are three Roman stations mentioned as being situated in this county, besides various Roman roads, and numerous encampments, and other entrenched earthen works.

Wiltshire is comprehended in the western circuit, and sends thirty-four members to parliament, viz.: two knights of the shire, two citizens for Salisbury, and two burgesses for each of the following boroughs: Chippenham, Calne, Cricklade, Devizes, Heytesbury, Hindon, Downton, Great Bedwin, Marlborough, Malmesbury, Ludgershall, Westbury, Wilton, Wooton-Basset, and Old Sarum. Wiltshire is divided into 28 hundreds, viz.: Alderbury, Amesbury, Bradford, Branch and Dole, Calne, Cawden, Chalk, Chippenham, Damerham North and South, Downton, Dunworth, Elstob and Everley, Frustfield, Heytesbury, Highworth, Kingsbridge, Kinwardstone, Malmesbury, Mere, Melksham, Pottern and Canning, Ramsbury, Selkley, Swanborough, Underditch, Warminster, Westbury, and Whorlesdown. The county contains one city, Salisbury; 15 boroughs, and 8 other market towns, viz.: Amesbury, Bradford, Highworth, Market Lavington, Mere, Swindon, Trowbridge, and Warminster; the whole containing 304 parishes, 2946 houses, inhabited by 185,107 persons, viz.: 87,388 males, and 97,727 females, of whom 39,422 were returned as being employed in trade, handicrafts, and manufactures, and 53,517 in agriculture.

WILTZ, a town of the Netherlands, in the duchy of Luxemburg; 12 miles east of Bastogne. Population 2000.

WILY, *adj.* Cunning; sly; full of stratagem; fraudulent; insidious; subtle; mischievously artful.

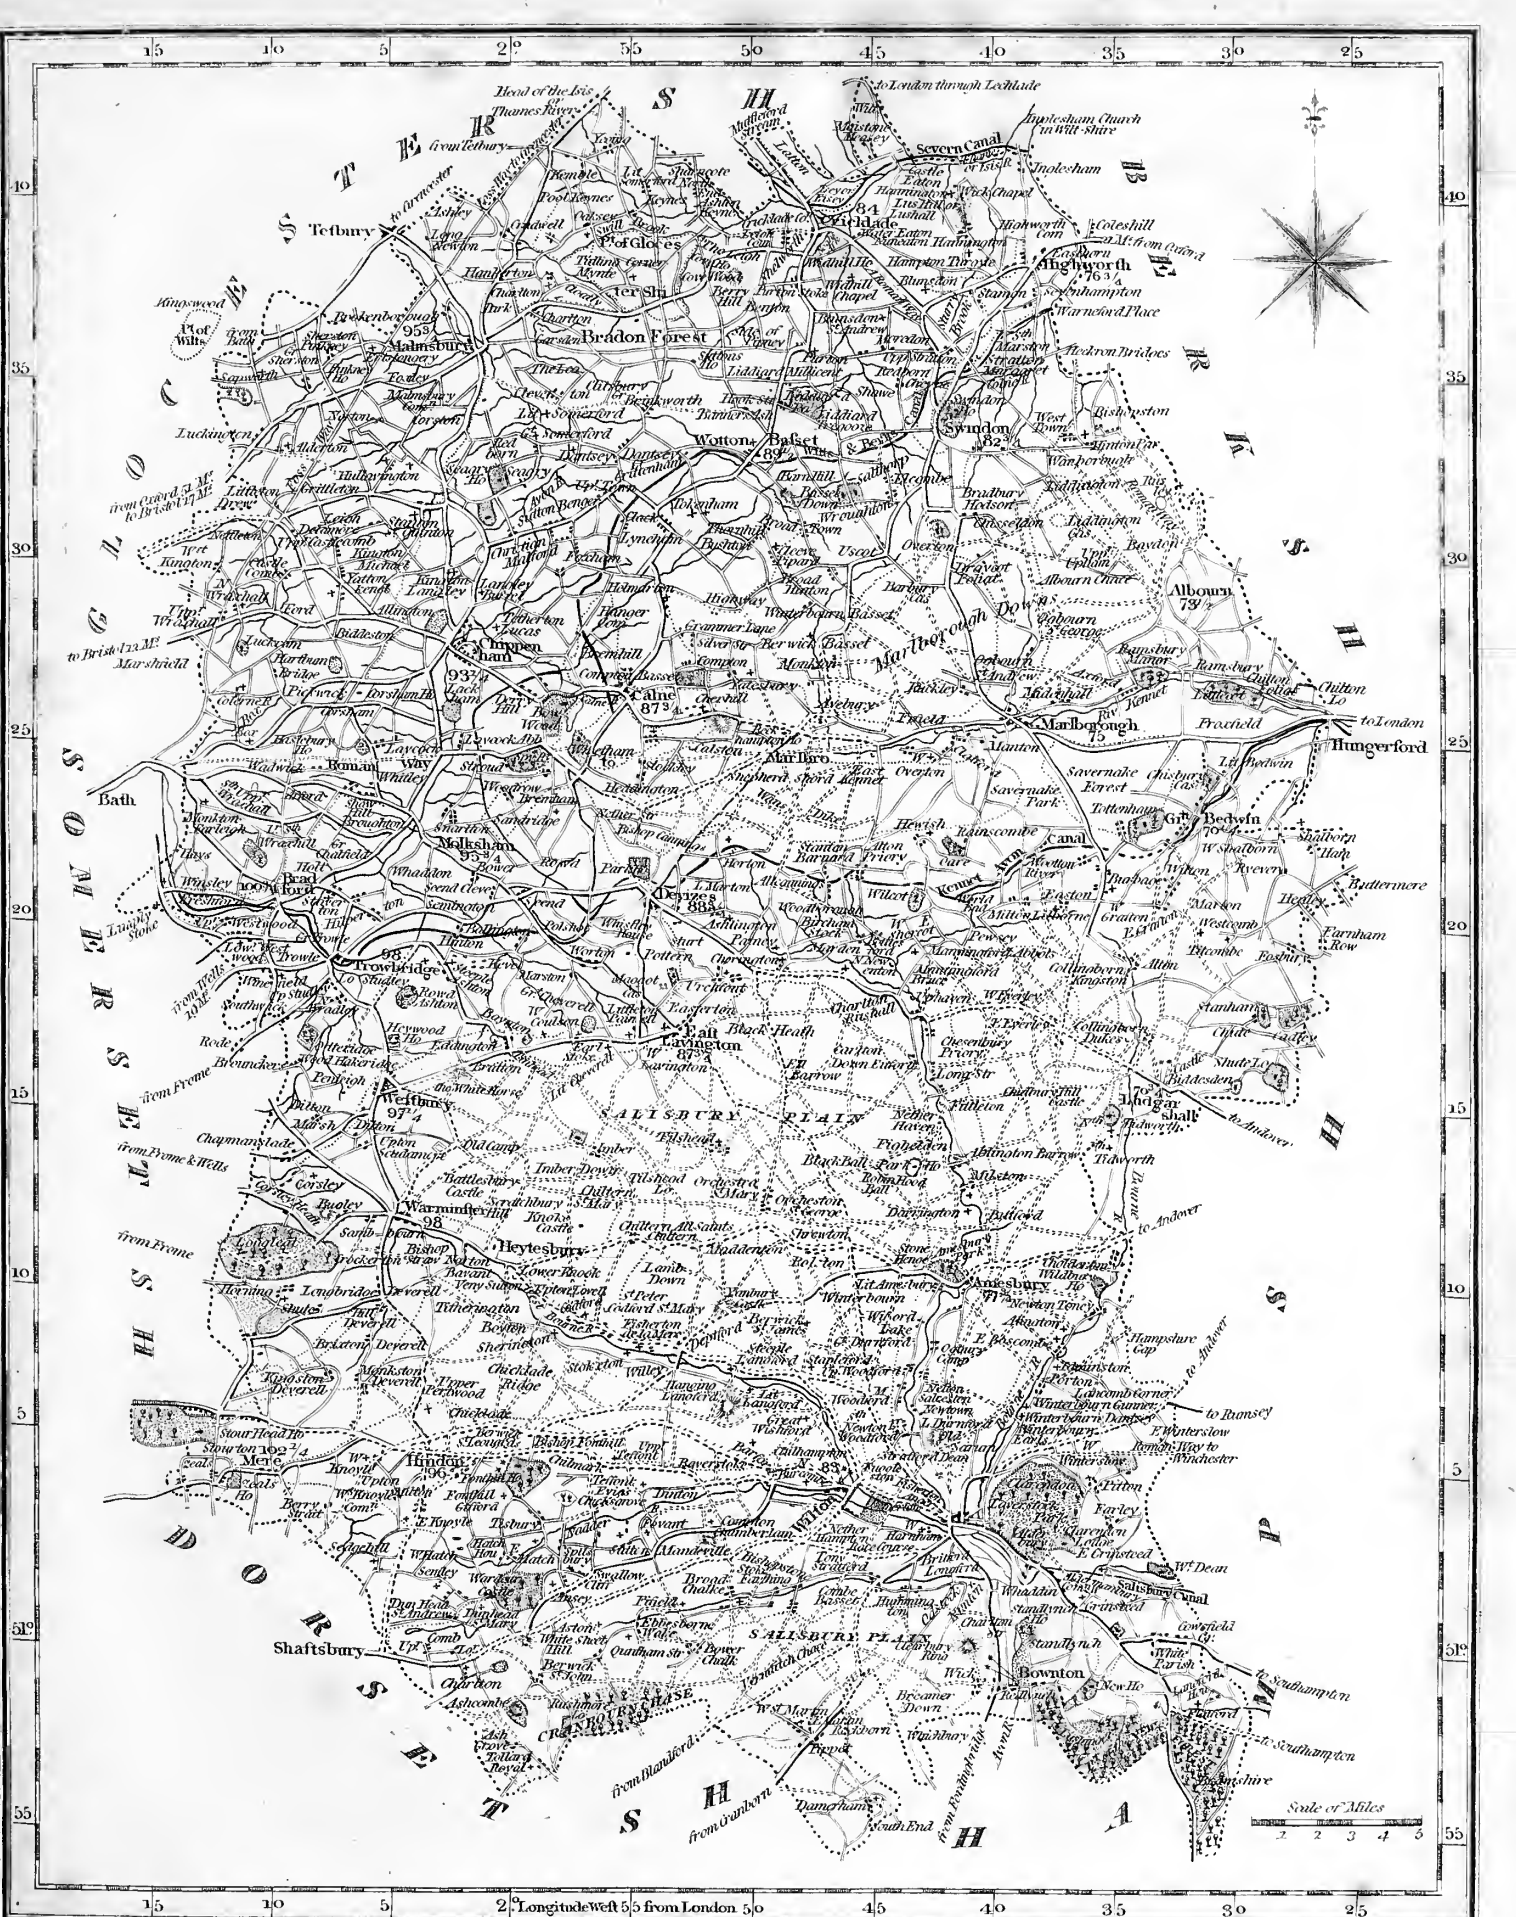

In the *wily* snake
Whatever slights, none would suspicions mark
As from his wit, and native subtily
Proceeding. *Milton.*

WILY, a parish of England, in Wiltshire; 7 miles east-north-east of Hindon.

WIMBISH, a parish of England, in Essex; 4 miles east-south-east of Saffron Walden. Population 769.

WIMBLE, *adj.* Active; nimble; shifting to and fro.
He was so *wimble* and so *wight*,
From bough to bough he leaped light,
And oft the pumies latched. *Spenser.*

WIMBLE,

WILTSHIRE.

Engraved for the Encyclopedia Londinensis, 1823.

WIMBLE, *s.* [*wimpel*, old Dutch, from *wemelen*, to bore.] An instrument with which holes are bored.

At harvest-home, trembling to approach
The little barrel which he fears to broach,
He 'ssays the *wimble*, often draws it back,
And deals to thirsty servants but a smack.

Dryden.

To WIMBLE, *v. a.* To bore.—The soldier *wimbled* a hole into the coffin that was largest, probably fancying there was something well worthy his adventure. *Sir T. Herbert.*

WIMBLETON, a township of England, North Riding of Yorkshire, near Helmsley.—2. A village and parish of England, in the county of Surrey, and in the vicinity of the metropolis, noted for the numerous elegant villas and mansions which it contains. Wimbleton church is a new building, in the Grecian style, erected in 1788, at the sole expense of the inhabitants. In the village are some copper mills, a manufactory for printing calicoes, and another of japanned ware. Wimbleton common, which joins to that of Putney, is about a mile square, and though formerly famous for robberies, has now many handsome residences around it. Earl Spencer has a handsome mansion here: the original house was built by the son of the lord treasurer Burleigh in 1588, and afterwards rebuilt by Sarah, duchess of Marlborough; but it was burnt down in 1785. The park and grounds are laid out in great taste, containing an area of 1200 acres. Wimbleton Lodge is an elegant modern structure. Among other villas which skirt the common, is that of the late John Horne Tooke, where that celebrated character closed his career in March, 1812. At the south-west corner is a circular encampment, with a single ditch, including a space of seven acres. This, by Camden and others, is supposed to have been the spot where a battle was fought between Ceaulin, king of the West Saxons, and Ethelbert, king of Kent, in which the latter was defeated. This battle, according to historical report, was fought at Wibadune, in the year 568. Population 1914.

WIMBLETON, POINT, a cape on the west coast of North America, at the extremity of a peninsula, between two arms of Cross Sound. Lat. 58. 19. N. long. 223. 56. E.

WIMBLEHILL, a hamlet of England, in the parish of Ashill, Somersetshire.

WIMBLINGTON, a hamlet of England, in Cambridge-shire; 4 miles south of March. Population 679.

WIMBOLDERLEY, a township of England, in Cheshire, parish of Middlewich.

WIMBORNE-MINSTER, a market town of England, in Dorsetshire, of very high antiquity, and celebrated for its beautiful collegiate church. It is situated between the rivers Stour and Allen, over each of which it has a bridge, on a dry gravelly soil, in one of the most delightful vales in the kingdom. It was called by the Romans *Vindogladia*, or *Ventageladia*, alluding to its situation on a river; and is supposed to have formed a station to the camp at Badbury. The later appellation of Wimborne, or Wimbourne, is Saxon, being derived from Bourne, a brook or running water, and Wim, a little river which flows on the north and east sides of the town. The term Minster is added from the church, to distinguish it from other places of the name of Wimbourne. The church is deserving of particular notice. Some are of opinion that it is of the heaviest and earliest species of Saxon architecture, and that its form sufficiently attests its antiquity; while others are of opinion that the eastern tower, and most part of the church, was built soon after the conquest. Many parts are apparently of the Saxon age, particularly the semi-circular arches on the eastern tower, the false windows in the south transept, and several others. This edifice is built in the form of a cross, with two quadrangular towers; one of them standing on the middle of the roof, and the other at the west end. The former was adorned anciently with a spire, said to have been of an extraordinary height. The whole building is divided in the manner of a cathedral, and consists of a chancel, nave, choir, and side aisles; a transept or cross aisle, and three porches. Its length, from east to west, is 180

Vol. XXIV. No. 1664.

feet. The ascent to the chancel is by a flight of twelve steps, in two divisions, six to the stalls, and six to the chancel, which give it a very noble and grand appearance. Both chancel and choir are supported by eight pillars, over which are five windows on the north, all open, and only three on the south side, but all much smaller than those of the nave. The choir has seven stalls on each side, besides two at the upper end; the whole covered with canopies of carved oak. On the south side of the altar are four large niches or stalls, handsomely purfled; one of which has a holy-water basin on a pillar: and at the west end is a handsome organ. The nave is supported on each side by six massy pillars, of an irregular form; above which are pointed arches, with zig-zag mouldings; the whole enlightened by a similar number of windows, apparently of a much later fashion. In this church numerous royal and noble personages have been buried, most of whom were anciently commemorated by suitable monuments. Of these, many are destroyed by time, and more by violence. King Ethelred, who was slain in battle by the Danes, is said to have been buried here, and his tomb is pointed out on the north side of the altar. There is a tything or liberty within the town, styled the Borough, in which a court is held at Michaelmas yearly, the privilege of H. Bankes, Esq. It is a court,leet and court baron; twelve jurymen sworn, who appoint two bailiffs of the Borough, and they are sworn in, in the same manner as constables at other courts. They have no power out of the tything. They have nothing to do with that part called the town. Market on Friday; and its fairs are the Friday before Good Friday, and the 14th September; 26 miles east-north-east of Dorchester, and 100 south-west-by-west of London. Population 3560.

WIMBORNE, ALL SAINTS and ST. GILES, two united parishes of England, in the county of Dorset, situated on the river Allen. Population 386.

WIMBOTSHAM, a parish of England, in Norfolk, near Market Downham.

WIMESWOLD, a parish of England, in Leicestershire; 5 miles north-east of Loughborough.

WIMMA, a river of Germany, in Hanover, and the duchy of Luneburg, which rises near Harburg, and after traversing the duchy of Bremen, runs into the Weser.

WIMMENTHAL, a large village of Germany, in Wirtemberg, near Heilbronn.

WIMMERBY, a town of Sweden, in the province of Smaland; 62 miles north of Calmar. Population 1000.

WIMMINGTON, a parish of England, in Bedfordshire; 12 miles from Bedford.

WIMMIS, a small town and castle of Switzerland, in the canton of Bern; 18 miles south of Bern.

WIMPFEN, a town of Germany, in Hesse-Darmstadt; 65 miles north of Heilbronn. Population 2000.

WIMPLE, *s.* [*guimple*, Fr.] A hood; a veil.

So fair and fresh, as freshest flower in May,

For she had laid her mournful stole aside,

And widow-like sad *wimple* thrown away.

Spenser.

WIMPLE, *s.* [*piplion*, Lat.] A plant.

To WIMPLE, *v. a.* [*wimpelen*, Teut., to veil.] To draw down as a hood or veil.

The same did hide,

Under a veil that *wimpled* was full low.

Spenser.

WIMPOLE, or WIMPLE, a parish of England, in Cambridgeshire; 4½ miles south-east of Caxton.

WIMPSTOW, a hamlet of England, in Warwickshire; 4½ miles south-by-east of Stratford-upon-Avon.

WIN, whether initial or final in the names of men, may either denote a masculine temper, from *win*, which signifies *war*, *strength*, &c., or else the general love and esteem he hath among the people, from the Saxon *wine*, i. e. *dear*, *beloved*. In the names of places it implies a battle fought there. *Gibson.*

To WIN, *v. a.* pret. *wan* and *won*; part. pass. *won*. To gain by conquest.

Follow cheerful to the trembling town ;
Press but an entrance, and presume it *won*.

Dryden.

To gain the victory in a contest.

Thy well breath'd horse
Impels the flying car, and *wins* the course.

Dryden.

To gain something withheld, or something valuable.—
When you see my son, tell him, that his sword can never
win the honour that he loses. *Shakspeare*.—To obtain ; to
allure to kindness or compliance.

Devilish Macbeth

By many of these trains hath sought to *win* me. *Shakspeare*.

To gain by play.—He had given a disagreeable vote in
parliament, for which reason not a man would have so much
correspondence with him as to *win* his money. *Addison*.—
To gain by persuasion.

They *win* great numbers to receive
With joy the tidings brought from heaven.

Milton.

To gain by courtship.

She's beautiful ; and therefore to be woo'd :
She is a woman, therefore to be *won*.

Shakspeare.

To WIN, *v. n.* To gain the victory.

Nor is it ought but just,
That he who in debate of truth hath *won*,
Should *win* in arms.

Milton.

To gain influence or favour.—You have a softness and be-
neficence *winning* on the hearts of others. *Dryden*.—To
gain ground.—The rabble will in time *win* upon power.
Shakspeare.—To be conqueror or gainer at play.

Charles, I will play no more to-night ;
My mind's not on't, you are too hard for me.
—Sir, I did never *win* of you before.

—But little, Charles ;
Nor shall not when my fancy's on my play. *Shakspeare*.

WINANDERMERE, or WINDERMERE, a parish of Eng-
land, in the county of Westmoreland, which takes its name
from the famous lake of Windermere, and comprehends the
three townships of Applebeck, Troutbeck, and Windermill-
beck. The lake of Windermere, which is the most exten-
sive in England, is situated at the foot of the Furness fells,
and forms the boundary line between the counties of West-
moreland and Lancashire, from Brathbridge to the river by
which Eastwaite water is discharged into the lake; the
whole of which to the south of this point being in Lanca-
shire, and the whole to the north in Westmoreland. It is
distinguished by the variety of beautiful prospects which it
exhibits. It is about 15 miles in length from north to south,
and about one mile broad at an average, although in many
places it is not more than 500 yards. The greatest depth is
about 220 feet, opposite Ecclefrigg crag. It is famous for its
fine char, and abounds also with trout, perch, pike, and eels.
This lake is frequently intersected by promontories, which
render its shores very winding ; and it is spotted with islands.
Among these, the Holme, or Great island, on an oblong tract
of about 30 acres, with a good house on it, crosses the lake
in an oblique line, surrounded by a number of inferior isles,
finely formed and wooded. They make together a kind of
archipelago. In navigating it upward, from the Great island,
the extremity appears singularly grand, its parts neat and
picturesque ; and the view of the surrounding scenery, from
Cove to Kirkston, is astonishingly sublime and beautiful.

WINBROUGH, a hill of Scotland, in Roxburghshire.

WINCANTON, a market town and parish of England,
in the county of Somerset, situated on the declivity of a hill,
which commands a beautiful prospect of the adjacent
country. It is a place of considerable antiquity, and was
the scene of many actions and encounters between the Britons,
Saxons, and Danes. It has a church, with a square tower
and 6 bells, and a neat market-house. Great part of the
town was destroyed by fire in the month of April, 1747.
The inhabitants carry on a considerable trade in the manu-
facture of ticks and dowlas, serges, and stockings, and also

in cheese, great quantities of which are brought hither from
the neighbouring towns, and disposed of to dealers from
London. Market on Wednesday, and two annual fairs ;
24 miles south of Bath, and 108 west-by-south of London.
Population 1850.

To WINCE, *v. n.* [*gwingo*, Welsh.] To kick as impa-
tient of a rider, or of pain.

I will sit as quiet as a lamb,

I will not stir, nor *wince*, nor speak a word. *Shakspeare*.

WINCEBY, a parish of England, in Lincolnshire ; 4
miles east-by-south of Horncastle.

WINCER, *s.* A kicking beast ; one wincing as a beast.
—A slovenly *wincer* of a confutation. *Milton*.

WINCH, *s.* [*guincher*, French, to twist.] A windlass ;
something held in the hand by which a wheel or cylinder is
turned.—Put a *winch* with the wheel. *Mortimer*.

To WINCH, *v. a.* [The same with *wince*, or perhaps
from *guincher*, French, to twist ; *winch* signifying some-
times to writhe or contort the body.] To kick with impa-
tience ; to shrink from any uneasiness.

We who have free souls,
It touches not, let the gall'd jade *winch* ;

Shakspeare.

WINCH, *s.* A kick of a beast impatient of the rider or
of pain.—The mule, frightened by that terrible blow, ran away
as fast as it could about the fields, and within two or three
winces overthrew him to the ground. *Shelton*.

WINCH, EAST, a parish of England, in Norfolk ; 6
miles south-east-by-east of Lynn Regis.

WINCH, WEST, another parish of England, in the above
county, situated near the river Yar ; 3 miles south of Lynn
Regis.

WINCHAM, or WINSHAM, a hamlet of England, in
Cheshire ; 2 miles north-east of Norwich.

WINCHCOMBE, a market town of England, in the
county of Gloucester, situated on a small stream called the
Isbourne, which runs into the Avon. The houses are in
general well built, but the church is the principal building
deserving notice: it is a noble Gothic structure, with a tower
at the west end, and contains several handsome monuments.
Besides the church, here are three charity schools, and an
almshouse. Winchcombe is a town of great antiquity, and
was once deemed a county of itself, enjoying peculiar privi-
leges. The town or borough, as it is called, is governed by
two bailiffs, chosen annually. Kenulph, king of Mercia, had
a palace here in the 8th century ; he also founded a monastery
in the place, whose abbot afterwards sat in parliament as a
baron. Not the least vestiges of it now remain. Until the
reign of Charles II. this place was noted for its plantations of
tobacco. Market on Saturday, and three annual fairs, one
of which, in March, is a large one for horses ; 16 miles north-
east of Gloucester, and 93 west-north-west of London. Popu-
lation 1256.

WINCHELSEA, a borough and Market town of England,
in the county of Sussex, is a place of great antiquity, and was
once populous and flourishing, but is now reduced to only
126 houses. Of the ancient town little more is known. It
is a member of the Cinque Ports. During the turbulent
reign of Henry III. its sailors were famed for committing
piracies on the high seas. Edward III. attacked the place,
took it by storm, and put to death the principal persons who
were concerned in these piracies. The town also suffered
under another and still more grievous calamity, being inun-
dated by a rising of the sea, which took place about the end
of the 12th century. This calamity does not appear to have
come on so suddenly as not to give some warning to the
inhabitants of their danger ; and they accordingly appear to
have built other habitations, on ground assigned them for
the purpose by Edward I. This town, encouraged by the
favour of the sovereign, who continued to it all the privileges
enjoyed by the old town, increased in buildings and popula-
tion ; but in less than twenty years was twice pillaged, first
by the French, and again by the Spaniards, who landed near
Farley Head. In 1358 the French once more attacked and partly

partly destroyed the town, but were foiled in another attempt, which, after having burned Rye, they made upon it in 1377.

From the rapid succession of the calamitous events which followed the foundation of the new town, it may be questioned whether it was ever completely finished; but the many spacious crypts and vaults which have been discovered, afford sufficient evidence that it was numerous, if not fully, inhabited. The new town fell to decay, from a cause the reverse of that which had occasioned the ruin of the old one; the sea deserted its neighbourhood, and left in its place a dreary marsh. In 1573, however, Winchelsea retained so much of its opulence and importance, that queen Elizabeth, by whom it was visited in that year, struck with the general appearance of the town, the splendid scarlet robes of the mayor and jurats, and the numerous gentry who inhabited the place, complimented it with the title of Little London. Towards the end of her reign, the calamity of a retiring sea began in earnest to be felt. The channel which led to the harbour was first choked, and by insensible degrees the whole coast was deserted. The town, abandoned of course by the merchant and trader, soon declined; its houses and churches fell to ruin, and desolation spread over the whole compass of the hill on which it stood; so that a town once covering a surface of two miles in circumference, is now reduced to a few houses, in a corner of its ancient site.

In the middle of the town was a large square, now on most sides open to the country. In the centre of it stands the church, dedicated to St. Thomas, which, from its remains, appears to have been a beautiful edifice, originally built in the form of a cross. The lofty and spacious chancel, used by the parishioners for divine worship, and three aisles, are all that is now left entire. Within are yet left three of the lofty arches which supported the tower, springing from clustered columns. There were formerly two other parish churches dedicated to St. Giles and St. Leonard. The three gates which defended the approaches to the town, called New Gate, Strand Gate, and Land Gate, are yet standing, though in a very ruinous condition; and here and there a fragment of the walls, with an exterior foss, may still be discovered. The north-east, or Land Gate, leading to Rye, has a round tower on each side. The arch of the south, or Strand Gate, formed of vast rude stones, is almost flat. Near Camber Point, which terminates a marshy peninsula, about two miles north-east of the town, and half a mile from the sea, stands Winchelsea or Camber castle. It was built by Henry VIII. during his rage for universal fortification in 1539 and 1540, and is conjectured by some to have been erected on the site, or with the materials, of a more ancient fabric. The corporation consists of a mayor and 12 jurats, and it returns two members to parliament, chosen by the corporation and freemen; the number of voters about 40, and the returning officer the mayor. It has a trifling market on Saturday; and a fair on the 14th May; 8 miles north-east of Hastings, and 67 south-west of London. Population in 1811, 652: houses 126.

WINCHELSEA ISLAND, an island in the gulf of Carpentaria, near the coast of Groote Eylandt, with which it forms a bay called by captain Flinders North-west bay. It is about 5 or 6 miles long.

WINCHELSEA ISLAND, an island in the Pacific ocean; 30 miles south-east of Sir Charles Hardy's island.

WINCHENDON, a post township of the United States, in Worcester county, Massachusetts; 60 miles north-west of Boston. Population 1173.

WINCHENDON, **NETHER**, a parish of England, in Buckinghamshire; 6 miles west-by-south of Aylesbury.

WINCHENDON, **UPPER**, another parish in the above county; 5 miles west-by-north of Aylesbury.

WINCHESTER, an eminent and ancient city of England, in Hampshire, situated on the eastern declivity of a hill gradually sloping to the river Itchin, the chalky cliffs of which, combined with the whiteness of the surrounding soil, is affirmed by Camden to have occasioned its original name, which was *Caer Gwent*, or the White City. Most of the buildings have an appearance of antiquity, and the streets

are broad, and remarkably clean. It is about half a mile long from east to west, about a mile and a half in compass, and contains eight churches, exclusive of St. Bartholomew's at Hyde. Although the early history of Winchester is involved in all the confusion of those distant ages, there can be no doubt that it has a fair claim to great antiquity. It was known in the time of the Romans, and is supposed to have been the site of a Roman encampment. During the contests of the Britons and the Saxons, it was well known, and became the capital of the West Saxon kingdom. Under the rule of Egbert, by whom all the Saxon kingdoms were united into one, it became the metropolis of the kingdom. In the reign of William the Conqueror, though Winchester was still a royal residence, London began to rival it, and to acquire the pre-eminence; and about the reign of Edward I. the increased importance of London operated greatly to the disadvantage of Winchester, as it became in a great measure the royal residence, and drew from Winchester all the attendants on the court, and others engaged in public affairs, whose expenditure had contributed to the prosperity of the city. In the reign of Edward III. Winchester was appointed as one of the fixed markets or staples for wool; but the growing commerce of the city was interrupted by various adverse circumstances, particularly by a most destructive plague, which broke out about the year 1348, and spent its fury in the neighbourhood; and finally, the wool staple having been removed to Calais, the decline of wealth and commerce became sensible and uniform. In the reign of Henry VIII. it received another blow in the dissolution of monasteries, and the consequent destruction of religious houses; after which, Winchester contained scarcely any thing more than a mere shadow of its former grandeur. During the succeeding reigns it still continued to decline; and in the eventful times of Charles I. the city and castle of Winchester were secured for the parliament by Sir William Waller. In 1643 the castle was seized and garrisoned by the royalists. After the battle of Naseby, the place surrendered to Cromwell, after a short siege; and the works of the castle were destroyed, together with the fortifications of the city, the Bishop's castle of Wolversey, and several churches and public buildings. Winchester was desolated, along with the rest of the kingdom, by the great plague of 1665.

The cathedral of Winchester is one of the most interesting buildings in England, whether considered with respect to the antiquity of its foundation, the importance of the scenes that have been transacted in it, or the characters of the personages with whose mortal remains it is enriched and hallowed. It is also curious as an instructive example of architecture, whether of the Saxon, Norman, or English styles, but particularly of the latter, both in its early and improved state. The original structure, built by the Saxon kings Kingegils and Kenewalch, is entirely destroyed; but of that built by Eihelwold, the crypt beneath the high altar is yet remaining. In the 11th century the cathedral was rebuilt, or greatly enlarged and improved, by bishop Walkelin, whose buildings were completed in the year 1093. The next improvement of the cathedral was undertaken by William de Edyngton, treasurer to Edward III., and was finished by bishop Wickham in 1394. The object of this improvement seems to have been rather to adorn the cathedral with the rich architecture of the 13th and 14th centuries, than to repair any decay in the structure; and as much, therefore, of the Norman building was preserved as could be fashioned into the improved style. The west end of the cathedral was now complete in its kind; but the eastern part of it, from the tower to the low aisles of De Lucy, was far from being conformable to the rest, as it consisted of the Norman work of Walkelin, repaired and decorated at subsequent periods, when that great and good prelate, Fox, at the beginning of the 16th century, undertook to rebuild it. This he accordingly performed, with all the finished elegance that the English style had at that period acquired. The dimensions of the cathedral, as stated in Milner's and in Gale's Antiquities, are as follow: whole length of the cathedral, 545 feet; length of the nave, from the west porch to the iron door

door at the entrance of the choir, 351 feet; length of the choir, 136 feet; length of the chapel of Our Lady, 54 feet; breadth of the cathedral, 87 feet; breadth of the choir, 40 feet; length of the transept, 186 feet; height of the tower, 150 feet. On entering the cathedral by the west door, before which a considerable quantity of earth and rubbish has been suffered to accumulate, the attention is first arrested by the vast and lofty columns of the nave, which have been judiciously made to assimilate with the pointed style, by surrounding them with clustered pillars, and other ornaments. Each column is about 12 feet in diameter; the space between them, or intercolumniation, is about two diameters only. The view into the choir is intercepted by a Grecian screen, of the Composite order, designed by Inigo Jones, and executed at the expense of Charles I. This object, from the incongruity of its style to the other parts of the building, and its hue being different from the rest of the stone work, has a very unpleasant effect. In the niches on each side the opening in the centre, are bronze statues of the above monarch and his predecessor, James I. Among the ornaments on the orbs of the groining, and on the *facia* below the open gallery that extends on each side of the nave, are the arms and busts of cardinal Beaufort, and his father, John of Gaunt, together with their devices, the white hart chained, and other insignia, as also the lily of Waynflete, intermingled with the arms and busts of bishop Wykeham. The space between the fifth and sixth columns, on the south side, is occupied by the tomb and chantry, or mortuary chapel, of the last named prelate. "The design and execution of the work before us," observes Mr. Milner, "are perhaps the most perfect specimens extant of the time when they were performed. The ornaments in general are rich, without being crowded; the carvings are delicate, without being finical." The chantry is divided in its length, into three arches, the canopies of which, according to a later improvement, are carved to humour the shape of the arches: the middlemost of these, which is the largest, is subdivided below into three compartments, those on the sides consisting of two. Beneath the tenth arch from the west end, and adjoining to the flight of steps leading towards the choir, is the ancient monumental chapel of bishop Edyngton, which, though in a similar style of architecture to that of bishop Wykeham, is by no means so ornamental or complete. On entering the southern transept, from the south aisle of the nave, the original work of Walkelin presents itself; and here are seen huge round pillars, and vast circular arches, piled upon one another to an amazing height; not, however, without symmetry, and certain simple ornaments; whilst other smaller columns, without either capitals or bases, are continued up the walls, between the arches, to the roof, which is open to the view. The architecture of the northern transept is equally ponderous and lofty with that of the southern, and the general style of the ornaments the same. The choir has a very venerable and solemn appearance, and is remarkable for having the great tower immediately over it, instead of over the space before the entrance, as in most other cathedrals. The tower was evidently intended to throw light into this part of the fabric; but in the reign of Charles I. it was injudiciously ceiled, and adorned in the manner it now appears, as the ornaments themselves indicate. In the middle of the choir, and opposite to the south and north doors, is the tomb of William Rufus. The stalls, which range on each side of the choir, with their misereres, canopies, pinnacles, and other ornaments, are very ancient, and present a profusion of foliage, crockets, busts, and human and animal figures, boldly designed, as well as executed. Opposite to the pulpit, on the south side, is the Episcopal throne, which, though elegantly constructed in the Corinthian order, is unsuitable to the prevailing style of architecture. Above the communion table, which is made to resemble an altar, rises a lofty canopy of wood work, consisting of festoons, and other carvings in alto-relievo. This heavy and tasteless object, together with the rails, was executed in the reign of Charles I. Behind, and partly concealed by the canopy and

altar-piece, is a magnificently carved screen, in stone-work, supposed to be the richest and most exquisite specimen of the pointed style in England. This was executed in the time of bishop Fox; and though greatly neglected, and clogged with whitewash, still exhibits an unrivalled delicacy of workmanship. It contains a variety of niches, with richly ornamented canopies, beneath each of which was formerly a statue; but these having been demolished on the reformation, their places are now occupied by Grecian urns. Immediately above the base-work of the screen, the eye catches the rich painting of the east window, which, though clouded with dust and cobwebs, still glows with a richness of colours that modern art has been unable to imitate. The stained glass of this window, however, as well as of the others round the choir, are little more than remnants of former splendour, most of the figures having been mutilated and disarranged at the time of the civil wars. They chiefly consist of apostles, prophets, and bishops, with appropriate legends and symbols. Leaving the choir, and passing into the south aisle, the gorgeous chapel or chantry of bishop Fox claims attention; in which there is a luxuriance of ornament in the arches, columns, and niches, which baffles minute description, and which would appear excessive, were not the whole executed with exact symmetry, proportion, and finished elegance. Parallel with the above, and occupying the entire space behind the altar, is another chapel; at the north end of which is the chapel of bishop Gardiner, which is an absurd intermixture, and an indifferent specimen, of the pointed and Ionic styles. The magnificent chantries of cardinal Beaufort and of bishop Waynflete are both admired for elegance of design and execution. The eastern extremity of the cathedral is terminated by the spacious chapel of Our Lady, and a smaller chapel, inclosed on each side. On the south of the above is bishop Langton's chapel, which displays some fine carvings in oak, of vine leaves, grapes, armorial bearings, &c. It contains also several elegant tombs. The last interesting object that remains to be described is the celebrated and ancient font, the carvings on which have frequently exercised the sagacity of antiquarians. This stands within the middle arch of Wykeham's part of the church, on the north side, and consists of a square block of dark marble, supported by pillars of the same material; it is covered on the top, and the four sides, with rude carvings, which bespeak its antiquity. The great cloisters of the cathedral, which extended 180 feet east and west, and 174 feet north and south, were destroyed during the prelacy of bishop Horne, in the reign of queen Elizabeth; but on the east side of the quadrangle which they formed, is yet remaining a dark, unornamented ancient passage, or cloister, 90 feet in length, that led to the infirmary, and other offices of the monastery. Southward of this is a doorway, that conducted to the chapter-house, the site of which now forms the dean's garden. The refectory, or hall, was about 41 feet in length, 23 broad, and nearly 40 high: it is now divided into two stories. Under the refectory and vestibule are still to be seen two kitchens, arched over in the Norman fashion, and supported by single pillars in the middle of them. One of the most celebrated institutions at Winchester is the college, founded by bishop Wykeham, between the years 1387 and 1393, on the site of an ancient grammar school, known to have existed before 1136, and probably much earlier. The building consists of two large courts, containing suits of apartments for the warden, 10 fellows, 70 scholars, three chaplains, six choristers, masters, &c. The entrance into the first court is beneath a spacious gateway, the canopy of which is supported by the mutilated busts of a king on one side, and a bishop on the other; evidently intended to represent the founder and his royal patron, Edward III. The middle tower over the gate leading into the interior court, is ornamented with three beautiful niches, having suitable canopies and pinnacles to adorn them. Passing under this tower into the second court, the elegant and uniform style of the ancient buildings has a striking appearance; more especially the magnificent chapel and hall forming the south wing of the quadrangle, and supported by bold and ornamental buttresses,

and enlightened by lofty and richly mullioned windows. A stately tower, with turrets and pinnacles at the four corners, stands near the centre of this wing, built in the ornamented style of the 15th century. The entrance into the chapel is by a vestibule, with a richly ornamented ceiling. The interior has a very striking effect, arising from the bold and lofty vaulting, which is finely ornamented with tracery, and the "dim religious light," that is diffused around from its "storied windows." These display an uncommon variety of saints of every description, as kings, prelates, and nuns. Extending from the chapel southward are the cloisters, which are 132 feet square, and appear to have been built early in the 15th century. In the middle of the cloisters is the library, a strong stone building. Over the door of the school is a statue of the founder. Contiguous to the college on the west is a spacious quadrangular building, forming a detached school for commoners or gentlemen, not on the foundation; where they live in a collegiate manner, under the immediate care of the head master. The college, chapel, and school, were completely repaired in 1795. The ecclesiastical buildings in this city and its suburbs were formerly extremely numerous; the churches and chapels alone amounting to upwards of ninety, and several having colleges and monasteries attached to them. Scarcely twelve of them now remain; the others having been destroyed by the effects of war, or otherwise. The mother church of Winchester is St. Lawrence: it consists of one large aisle, with a lofty square tower, containing five bells. St. Thomas's is an ancient structure, consisting of two aisles, divided by round pillars of the Gothic order; the tower is a low, ordinary building. St. Maurice's was originally a priory, and consists of two aisles, one of which is very spacious; the tower is strong. St. Michael's is a low and ancient building, tiled, having two good aisles, and a tower containing five bells. St. Swithin's is erected over a postern called Kingsgate, and consists of a large neat room, ascended to by a stone staircase. St. Peter's Cheese-hill consists of two aisles, of different sizes, both neat, but plain: it has a tower, containing three bells. St. John's at Hill is divided into three aisles, by round Gothic pillars; the tower is remarkably strong, finished with a turret, containing a clock. St. Martin's Winnall was rebuilt in 1736, and consists of one aisle, having a small tower at the west end, containing one bell. At a short distance north-east from the college are the ruins of the celebrated Episcopal residence called Wolvesey castle, which was erected on the site of a more ancient palace, by the bishop, Henry de Blois, in the century immediately succeeding the conquest, the exact date being 1138. This castle was destroyed by Cromwell in 1646, and nothing now remains but its ruins. Winchester castle, of which scarcely any parts are now standing, was built by William the Conqueror, and occupied the commanding spot at the south-west angle of the city, where the king's house, or palace, erected by Charles II., now stands. This fortress has been the scene of many important transactions. The whole area of the castle was about 850 feet in length, north and south, and 250 in breadth east and west. The chapel belonging to the castle has been converted into a county-hall. It was originally dedicated to St. Stephen, and is supposed, from its style and materials, to have been built about the time of the monarch of that name. It is 110 feet in length, and consists of a nave and side aisles; but the appearance of the interior has been entirely changed through the alterations that have been made in it for the purposes of public business. At the east end is suspended the famous curiosity called Arthur's Round Table, which tradition has attributed to king Arthur; but modern inquiry, with more accuracy, to king Stephen, who appears to have introduced the use of the Round Table into this island, to prevent disputes for precedence among the chivalrous knights of his age. In the High-street, and nearly in the centre of the city, but partly obscured by the situation of some contiguous buildings, stands the city cross, an elegant specimen of the style of the age in which it was built, that of Henry VI. It consists of three stories, adorned with open arches, niches,

and pinnacles, surmounted with small crosses. The remains of the cross at the top still crown the ornamented shaft which rises from the base; and under one of the canopied niches, on the second story, is a statue. The height of the cross is 43 feet. Near the cathedral is a college or alms-house, founded by bishop Morley in 1672 for 10 clergymen's widows. Christ's hospital, commonly called the Blue Alms, was founded in 1706; besides which, there is a number of private charities, and three well endowed charity schools. The public infirmary is a handsome edifice, erected in 1759, the ascent to which is by a noble flight of steps. In the High-street is a market-cross, having five steps round it: this place also serves for the fish-market. The town-hall, or more properly the hall of the guild of merchants of Winchester, was rebuilt in the year 1713, on the site of a more ancient hall, erected in place of a former one, recorded to have been burnt down in 1112. Here the city archives, the original Winchester bushel given by king Edgar, with other measures, both for quantity and length, fixed as standards by succeeding princes, and various curious memorials of antiquity, are still preserved. In front is a good statue of queen Anne, presented by George Brydges, Esq., who was a representative of the city in seven successive parliaments. The market-house is a neat building, erected in 1772, for the sale of butter, eggs, poultry, &c. Before this edifice was completed, the above articles were exposed for sale round the city cross, and in the Pent-House, an ancient piazza, extending from the cross, on the south side of the High-street. In 1788, a new spacious county jail was erected on the Howardian plan, in the court of which is a neat chapel; there is also a bridewell for the city, and another for the county; the latter erected in 1786. The theatre is a handsome structure, built in 1785. There is an annual well attended music meeting, held here in September, continuing for three days, which closes with a ball. Winchester has also its winter assembly, concerts, balls, and every other fashionable amusement. The streets are well paved and lighted, under an act passed in 1770. Here are two banking-houses. On the site of the castle a royal palace was begun in 1683, the principal floor of which is a noble range of apartments, and contains in all 160 chambers; this has often been occupied by prisoners of war, on their parole. The plague made great devastations here in the years 941, 1348, and again in 1668; and at the west end of the town is an obelisk, having an inscription commemorative of these calamities. Many privileges have at various times been granted to the inhabitants of this city by different sovereigns. Its chief magistrate had the title of mayor conferred on him by Henry II. in 1184, some years before that appellation was known even in the capital itself. The first charter of incorporation was granted by king John; but the charter by which the city is now governed was given by queen Elizabeth. By this charter the government is vested in a mayor, recorder, six aldermen, a town-clerk, two coroners, two constables, and a council of twenty-four of the "better, discreeter, and more honest sort" of inhabitants. The mayor, recorder, and aldermen are justices of the peace. The first return from this city to parliament was in the 23d of Edward I. The right of election is vested in the corporation. Two members are sent to parliament, chosen by the corporation and free burgesses. Winchester has very little trade, but what immediately arises from its advantageous situation, in the very centre of the county; though an ancient wool-combing manufactory still exists in it; and of late years the silk manufacture has been introduced. All the public business of Hampshire is, however, transacted here; and there is never an interval of many weeks without a great conflux of strangers on that account, to the great emolument of the inhabitants. The same circumstance accounts for the number of gentlemen of the law who live here. Its cathedral and its college insure to it the residence also of a considerable number of superior clergy, with their families. The upper class of inhabitants, being well educated, and consisting of fixed residents, who are known to each other, live in the most friendly and social intercourse; and the lower ranks are in

general better taught, and more civil, than persons in the same situation in most other places. The provisions which the neighbouring country produces are of the very best quality; the covers also abound with game, and the rivers teem with trout and other fish. Its situation, in the vicinity of the sea, with which there is a direct communication by a navigable canal, at least as ancient as the reign of king John, is also the means of its obtaining the heavy commodities and merchandize of other countries, at a reasonable rate. When in the height of its prosperity, and possessing the benefit of the wool-staple, its wealth was greatly increased by the multitudes that flocked to its different fairs. Beyond the river Itchin, east, is a high hill, called St. Giles's, from an hospital whose ruins only are now visible. The markets are held on Wednesday and Saturday, and are well supplied with all kinds of provisions, poultry, fish, &c. Its fairs are the first Monday in Lent, and 24th October, held in the city; on the 2d August, held on Magdalen Hill; 12th September, on St. Giles's Hill; 11½ miles north-north-east of Southampton, and 62½ south-west-by-west of London. Population 6705.

WINCHESTER, a township of the United States, in Green county, Ohio, on Anderson's creek, 7 miles from Xenia.

WINCHESTER, a post town, borough, and capital of the United States, in Frederick county, Virginia; 30 miles south-west of Harper's Ferry, 70 west-north-west of Washington, 95 north-east of Staunton, and 150 north-north-west of Richmond. Population about 3000. Lat. 39. 16. N. long. 77. 28. W.

WINCHESTER, a post town of the United States, and capital of Clark county, Kentucky, on a branch of Licking river. Population 538.—2. A post township of Franklin county, Tennessee, in Elk river; 35 miles east-by-north of Fayetteville.

WINCHESTER, a town of the United States, and capital of New Madrid county, Missouri territory; 22 miles north of New Madrid.

WINCHFIELD, a parish of England, in Southamptonshire; 3 miles north-east of Odiham.

WINCHLEIGH, or WINKLEY, a parish of England, in Devonshire; 5 miles south-west of Chulmleigh. Population 1168.

WINCLE, a township of England, in Cheshire; 6 miles south-east of Macclesfield.

WINCOPIPE, *s.* There is a small red flower in the stubble-fields, which country people call the *wincopipe*; which, if it opens in the morning, you may be sure a fair day will follow. *Bacon.*

WIND, *s.* [pind, Saxon; *wind*, Dutch; *winds*, M. Goth.; *wind*, Icel. vox antiquiss. Celto-Scythica, ac fortè à simpliciori M. Goth. *wajan*, Germ. *wchen*, spirare. *Serenius.*] *Wind* is when any track of air moves from the place it is in, to any other, with an impetus that is sensible to us, wherefore it was not ill called by the ancients, a swifter course of air; a flowing wave of air; a flux, effusion, or stream of air. *Muschenbroek.*—The worthy fellow is our general. He's the rock, the oak not to be *wind* shaken. *Shakspeare.*—Direction of the blast from a particular point. As eastward; westward.

I'll give thee a *wind*.

I myself have all the other,
And the very points they blow;
All the quarters that they know
I' the shipman's card.

Shakspeare.

Breath; power or act of respiration.—If my *wind* were but long enough to say my prayers, I would repent. *Shakspeare.*—Air caused by any action.

On each side her
Stood pretty dimpled boys, like smiling Cupids
With divers colour'd fans, whose *wind* did seem
To glow the delicate cheeks which they did cool.

Shakspeare

Breath modulated by an instrument.
Their instruments were various in their kind,
Some for the bow, and some for breathing *wind*. *Dryden.*

Air impregnated with scent.

A hare had long escap'd pursuing hounds,
By often shifting into distant grounds,
Till finding all his artifices vain,
To save his life, he leap'd into the main.
But there, alas! he could not safety find,
A pack of dog-fish had him in the *wind*.

Swift.

Flatulence; windiness.

It turns

Wisdom to folly, as nourishment to *wind*.

Milton.

Any thing insignificant or light as *wind*.

Down the WIND. To decay.—A man that had a great veneration for an image in his house, found that the more he prayed to it to prosper him in the world, the more he went *down the wind* still. *L'Estrange.*

To take or have the WIND. To gain or have the upper hand.—Let a king in council beware how he opens his own inclinations too much, for else counsellors will but *take the wind* of him; instead of giving free council. *Bacon.*

To WIND, v. a. preter. *wound*; sometimes, though rarely, *winded*; part. *wound*. [pindban, Saxon; *winden*, Dutch.] To blow; to sound by inflation.—I will have a reheat *winded*. *Shakspeare.*—To turn round; to twist.—*Wind* the woodbine round this arbour. *Milton.*—To regulate in motion; to turn to this or that direction.

He vaulted with such ease into his seat,
As if an angel dropt down from the clouds,
To turn and *wind* a fiery pegasus,
And witch the world with noble horsemanship. *Shakspeare.*

To nose; to follow by scent.

In a commonwealth or realm,
The government is called the helm;
With which, like vessels under sail,
They're turn'd and *winded* by the tail.

Hudibras.

To ventilate. To turn by shifts or expedients.

Whence turning of religion's made
The means to turn and *wind* a trade.

Hudibras.

To introduce by insinuation.

You have contriv'd to take
From Rome all season'd offices, and to *wind*
Yourself into a power tyrannical.

Shakspeare.

To change.—Were our legislature vested in the prince, he might *wind* and turn our constitution at his pleasure, and shape our government to his fancy. *Addison.*—To entwine; to encircle.—Sleep thou, and I will *wind* thee in my arms. *Shakspeare.*

To WIND out. To extricate.—When he found himself dangerously embarked, he bethought himself of all possible ways to disentangle himself, and *to wind* himself out of the labyrinth he was in. *Clarendon.*

To WIND up. To bring to a small compass, as a bottom of thread.—Without solemnly *winding up* one argument, and intimating that he began another, he lets his thoughts, which were fully possessed of the matter, run in one continued strain. *Locke.*

To WIND up. To convolve the spring.—I frown the while, and perchance *wind up* my watch, or play with some rich jewel. *Shakspeare.*

To WIND up. To put into a state of renovated or continued motion.

Fate seemed to *wind* him up for fourscore years,
Yet freshly ran he on, ten winters more:
Till like a clock worn out with calling time,
The wheels of weary life at last stood still.

Dryden.

To WIND up. To raise by degrees.—These he did so *wind up* to his purpose that they withdrew from the court. *Hayward.*

To WIND up. To straighten a string by turning that on which it is rolled; to put in tune.

Your lute may *wind* its strings but little higher
To tune their notes to that immortal quire.

Prior.
To

To WIND up. To put in order for regular action: from a watch.

O you kind gods!
Cure this great breach of his abused nature;
Th' untun'd and jarring senses, O, *wind up*,
Of this child-chang'd father.

Shakspeare.

To WIND, v. n. To turn; to change.
So swift your judgments turn and *wind*,
You cast our fleetest wits a mile behind.

Dryden.

To turn; to be convolved.—Some plants can support themselves, and some others creep along the ground, or *wind* about other trees, and cannot support themselves. *Bacon.*
—To move round.

If aught obstruct thy course, yet stand not still,
But *wind* about till thou hast topp'd the hill.

Denham.

To proceed in flexures.

It shall not *wind* with such a deep indent,
As rob me of so rich a bottom here.

Shakspeare.

He *winds* with ease
Through the pure marble air his oblique way,
Amongst innumerable stars.

Milton.

Wound is commonly the preterite. Pope has used *winded*.
Swift ascending from the azure wave,
He took the path that *winded* to the cave.

Pope.

To be extricated; to be disentangled: with *out*.
Long labouring underneath, ere they could *wind*
Out of such prison.

Milton.

WINDAU, a town of Courland, on the Baltic, near the mouth of the river Windau. It has no harbour, but a large roadstead, rendered secure by sand-banks, which break the swell of the sea. It carries on a considerable trade in the export of articles from the interior, viz. corn, timber, flax, hides, tallow; also salt meat. It was formerly the place of meeting of the states of Courland, and is said to have been of more consequence than at present. It has a citadel, and is 70 miles west-north-west of Mittau. Its population is only 1000.

WINDBOUND, adj. Confined by contrary winds.
Yet not for this the *windbound* navy weigh'd;
Slack were their sails, and Neptune disobey'd.

Dryden.

WINDECK, a small town of Prussian Westphalia, in the duchy of Berg; 24 miles east of Bonn.

WINDECKEN, a town of Germany, in Hesse Cassel, on the river Nidder; 5 miles north-west of Hanau. Population 1000.

WINDDEGG, s. An egg not impregnated; an egg that does not contain the principles of life.—Sound eggs sink, and such as are added swim: as do also those termed hypenemia, or *winddeggs*. *Brown.*

WINDER, s. An instrument or person by which any thing is turned round.

The *winder* shows his workmanship so rare
As doth the fleece excel, and mocks her looser clew;
As neatly bottom'd up as nature forth it drew.

Drayton.

A plant that twists itself round others.—Plants that put forth their sap hastily, have their bodies not proportionable to their length; and therefore they are *winders* and creepers, as ivy and bryony. *Bacon.*—A winding step in a staircase. *Mason.*

WINDER, a township of England, in Cumberland; 5 miles from Whitehaven.

WINDER, High and Low, adjoining hamlets of England, in Westmoreland; 13 miles west-by-north of Appleby.

WINDERHAUSEN, a village of Germany, in Wirtemberg. Population 800.

WINDWEER, a village of the Netherlands, with 1300 inhabitants; 10 miles south-east of Groningen.

WINDFALL, s. Fruit blown down from the tree.—Their boughs were too great for their stem, they became a *windfall* upon the sudden. *Bacon.*—An unexpected legacy;

any unexpected advantage.—He had a mighty *windfall* out of doubt.— *B. Jonson.*

WINDFALLEN, adj. Blown down by the wind.—To gather *windfal'n* sticks, his greatest care. *Drayton.*

WINDFLOWER, s. The anemone. A flower.

WINDGALL, s. *Windgalls* are soft, yielding, flatulent tumours or bladders, full of corrupt jelly, which grow upon each side of the fetlock joints, and are so painful in hot weather and hard ways, that they make a horse to halt. They are caused by violent straining, or by a horse's standing on a sloping floor, or from extreme labour and heat, or by blows. *Farricr's Dict.*—His horse infected with the fashions, full of *windgalls*, and sped with spavins. *Shakspeare.*

WINDGUN, s. Gun which discharges the bullet by means of wind compressed.—The *windgun* is charged by the forcible compression of air, being injected through a syringe; the strife and distention of the imprisoned air serving, by the help of little falls or shuts within, to stop and keep close the vents by which it was admitted. *Wilkins.*

Forc'd from *windguns*, lead itself can fly,

And ponderous slugs cut swiftly through the sky. *Pope.*

WINDHAM, a post township of the United States, in Cumberland county, Maine; 130 miles north-north-east of Boston. Population 1613.—2. A township of Windham county, Vermont; 25 miles south-west of Windsor. Population 782.—3. A post township of Rockingham county, New Hampshire; 34 miles north-north-west of Boston. Population 742.—4. A post township and village of the United States, and capital of Windham county, Connecticut. The township is watered by the Shetucket; and the village contains a court-house, a jail, an academy, and a congregational meeting-house. A weekly newspaper is published here; 12 miles north-north-west of Norwich. Population 2416.—5. A post township of Greene county, New York. Population 3965.

WINDHAM, a county of the United States, in the south-east part of Vermont, bounded north by Windsor county, east by Connecticut river, south by Massachusetts, and west by Bennington county. Chief town Newfane. Population 26,760.

WINDHAM, a county of the United States, in Connecticut, bounded north and east by Massachusetts, south by New London county, and west by Tolland county. Population 28,611.

WINDHAM, POINT, a cape on the south-east of the entrance into Stephens's Passage, on the west coast of North America. Lat. 57. 31. N. long. 226. 36. E.

WINDHAUSEN, a large village of Germany, in the principality of Schwarzburg Rudolstadt.

WINDHEADFELL, a mountain of Scotland, in Roxburghshire, elevated 2000 feet above the level of the sea.

WINDINESS, s. Fulness of wind; flatulence.—A *windiness* and puffing up of your stomach after dinner, and in the morning. *Harvey.*—Tendency to generate wind.—Sena loseth somewhat of its *windiness* by decocting; and, generally, subtle or windy spirits are taken off by incension or evaporation. *Bacon.*—Tumour; puffiness.—From this his modest and humble charity, virtues which rarely cohabit with the swelling *windiness* of much knowledge, issued this. *Brerewood.*

WINDING, s. Flexure; meander.—It was the pleasantest voyage in the world to follow the *windings* of this river Inn, through such a variety of pleasing scenes as the course of it naturally led us. *Addison.*

The ways of heaven are dark and intricate;

Our understanding traces them in vain,

Nor sees with how much art the *windings* run,

Nor where the regular confusion ends.

Addison.

WINDINGSHEET, s. A sheet in which the dead are enwrapped.

These arms of mine shall be thy *windingsheet*:

My heart, sweet boy, shall be thy sepulchre;

For from my heart thine image ne'er shall go.

Shakspeare.

WINDISCH,

WINDISCH, a village of Switzerland, in the canton of Berne; 3 miles west of Baden.

WINDLACE, or WINDLASS, *s.* A handle by which a rope or lace is wrapped together round a cylinder. A handle by which any thing is turned.

Thus do we of wisdom and of reach,
With *windlasses*, and with assays of bias,
By indirections find directions out. *Shakspeare.*

To WINDLACE, or WINDLASS, *v. n.* To act indirectly; to go warily to work.—She is not so much at leisure as to *windlace*, or use craft, to satisfy them. *Hammond.*

WINDLASTRAE LAW, a mountain of Scotland, in Selkirkshire, 2295 feet above the level of the sea.

WINDLE, *s.* A spindle.

WINDLE, a township of England, in Lancashire; 4 miles north-east of Prescott. Population 4294.

WINDLESHAM, a township of England, in Surrey, on the borders of Windsor Forest; 1 mile east-north-east of Bagshot.

WINDLESS, *adj.* Wanting wind; out of breath. *Barret.*

The weary hounds at last retire,
Windless, displeas'd, from the fruitless chace. *Fairfax.*

WINDLESTONE, a township of England, county of Durham; 1½ mile west-north-west of Rushy Ford.

WINDLEY, a hamlet of England, in Derbyshire; 5 miles north-by-west of Derby.

WINDMILL, *s.* A mill turned by the wind.

We, like Don Quixote, do advance
Against a *windmill* our vain lance. *Waller.*

His fancy has made a giant of a *windmill*, and he's now engaging it. *Atterbury.*

A machine which is put in motion by the force of the wind. Wind-mills are in general applied to the purpose of grinding corn, but are occasionally used to give motion to machines for raising water, sawing mills, or for other purposes.

The invention of wind-mills is not of very remote date. According to some authors they were first used in France in the sixth century; while others maintain that they were brought to Europe in the time of the crusades, and that they had long been employed in the East, where the scarcity of water precluded the application of that powerful agent to machinery.

The wind-mill, though a common machine, has some things in it more ingenious than is usually imagined. Add, that it is commonly allowed to have a degree of perfection, which few of the popular engines have attained to, and which the makers are but little aware of: though the aid of mathematics has furnished ample matter for its improvement.

The vertical wind-mill, which is the kind in most common use, consists of an axis or shaft placed in the direction of the wind, and usually inclining a little upwards from the horizontal line. At one end of this, four long arms or yards are fixed perpendicular to the axis, and cross each other at right angles; into these arms small cross-bars are mortised at right angles; and other long bars are joined to them, which are parallel to the length of the arms; so that the bars intersect each other in the manner of lattice-work, and form a surface, on which a cloth can be spread to receive the action of the wind. These are called the sails; they are in form of a trapezium, and are usually nine yards long and two wide.

The circular motion is produced by the obliquity of the planes of these surfaces, from the plane in which all the four arms are situated; by these means, when the wind blows in the direction of the axis, it does not impinge upon the sails at right angles to their surfaces, but strikes obliquely; hence the effort of the sail to recede from the wind, causes it to turn round with the common axis, and the four sails are all made oblique in the same direction, so as to unite their efforts for the common object.

That the wind may act with the greatest efficiency upon the sails, the wind-shaft must have the same direction as the wind. But as this direction is perpetually changing, some apparatus is necessary for bringing the wind-shaft and sails into their proper position: this is done by turning the axis and sails round in an horizontal direction. There are two methods of effecting this. In the old mills the whole of the mill or building which contains the machinery is sustained upon a vertical post, firmly fixed as a stand or foot, upon which the whole machine can be turned by a lever, to present the sails to any quarter of the horizon from whence the wind blows; and hence these are called post wind-mills, and are necessarily made of wood. The other kind is called a smock-mill, in which only the dome-cap or head, which contains the axis of the sails, and covers the great cog-wheel, turns round horizontally; the other parts of the machinery being contained in a fixed building, which rises up in form of a conical tower of masonry, and is surmounted by this moveable cap or dome, which is supported on rollers, so as to turn round easily.

As both the common methods of adjusting the wind-shaft require human assistance, it would be very desirable that the same effect should be produced solely by the action of the wind. This may be done by fixing a large wooden vane or weathercock at the extremity of a long horizontal arm, which lies in the same vertical plane with the wind-shaft.

On the shaft of the post-mill are constructed two large cog-wheels; that nearest the sails is the largest, and is called the head-wheel; the smallest is called the tail-wheel: these respectively act on small cog-wheels attached to the spindle, which turns the stones. For the bolting machinery, &c. see MILL and MECHANICS.

WINDORF, a market town of Bavaria, on the Danube; 9 miles above Passau. Boats are built here for navigating the river.

WINDOW, *s.* [*vindue*, Danish. Skinner thinks it originally *wind-door*. Dr. Johnson.—Serenius most satisfactorily offers the Icel. *windaugæ*, q. d. oculus tecti, ab intromissa luce.]—An aperture in a building by which air and light are intromitted.

Being one day at my *window* all alone,
Many strange things happened me to see. *Spenser.*

The frame of glass or any other materials that covers the aperture.

To thee I do commend my watchful soul,
Ere I let fall the *windows* of mine eyes:
Sleeping or waking, oh defend me still! *Shakspeare.*

Lines crossing each other.
The fav'rite, that just begins to prattle,
Is very humoursome, and makes great clutter,
Till he has *windows* on his bread and butter. *King.*

An aperture resembling a window.
To WINDOW, *v. a.* To furnish with windows.
With pert flat eyes she *window'd* well its head,
A brain of feathers, and a heart of lead. *Pope.*

To place at a window.
Would'st thou be *window'd* in great Rome, and see
Thy master thus with pleacht arms, bending down
His corrigible neck, his face subdu'd
To penetrative shame? *Shakspeare.*

To break into openings.
Poor naked wretches, wherso'er you are,
That bide the pelting of this pitiless storm,
How shall your houseless heads, and unfed sides,
Your loop'd and *window'd* raggedness, defend you
From seasons such as these? *Shakspeare.*

WINDOWY, *adj.* Like a window; having little crossings.
Or treacherously poor fish beset
With strangling snare, or *windowy* net. *Donne.*

WINDPIPE, *s.* The passage for the breath; the *aspera arteria*.

Let gallows gape for dogs, let man go free,
And let not hemp his *windpipe* suffocate. . . *Shakspeare.*

WINDRIDGE, a hamlet of England, in Hertfordshire, adjoining St. Alban's.

WINDRUSH, a parish of England, in Gloucestershire; 4 miles east by-south of North Leach.

WINDRUSH, a river of England, in Oxfordshire, which runs into the Thames, above Langworth, about 5 miles south-south-east of Witney.

WINDSBACH, a town of Germany, in Bavarian Franconia; 17 miles south-west of Nuremberg. Population 1000.

WINDSHEIM, a small town of Germany, in Bavarian Franconia, on the Aisch. It contains 4500 inhabitants, chiefly Lutherans; and has an hospital, a Latin school, and an elegant council-house. It is surrounded by an earthen mound, which now serves only as a public walk; 30 miles south-east of Wurzburg.

WINDSHOCK, *s.* A crack or other damage in the body of a tree, supposed to be occasioned by high winds. *Ash.*—The *windshock* is a bruise and shiver throughout the tree, though not constantly visible. *Evelyn.*

WINDSLEY, a township of England, West Riding of Yorkshire, in the parish of Kirkby Malzerd.

WINDSOR, a town of New South Wales, formerly called the Green-hills, situated near the confluence of the South Creek with the river Hawkesbury. It stands on a hill, whose elevation is about 100 feet above the level of the river, at low water. The buildings here are much of the same cast as at Parramatta, being in general weather boarded without, and lathed and plastered within. The public buildings are a church, government-house, hospital, barracks, court-house, store-house, and jail, none of which are worthy of notice. The bulk of the population is composed of settlers, who have farms in the neighbourhood, and of their servants. There are, besides, a few inferior traders, publicans, and artificers. The Hawkesbury here is of considerable size, and navigable for vessels of 100 tons burden, for about four miles above the town. A little higher up, it is joined by, or rather is called, the Nepean river, and has several shallows; but with the help of two or three ferries, it might still be rendered navigable for boats of 12 or 15 tons burden, for about 20 miles further. This substitution of water for land carriage, would be of great advantage to the numerous settlers who inhabit its highly fertile banks, and would also considerably promote the extension of agriculture throughout the adjacent districts. Following the sinuosities of the river, the distance of Windsor from the sea is about 140 miles; whereas in a straight line it is not more than 35. The rise of the tide is about four feet, and the water is fresh for 40 miles below the town. Land is about 10 per cent. higher than at Parramatta, and is advancing rapidly in price. Population 600.—2. A county of the United States, on the east side of Vermont, bounded north by Orange county, east by Connecticut river, south by Windham county, and west by Rutland and Addison counties. Chief towns, Windsor and Woodstock. Population 34,877.—3. A post town of the United States, in Windsor county, Vermont, on the west bank of the Connecticut. It is a very pleasant, handsome, and flourishing town, one of the largest in the state, and has considerable trade; 112 miles northwest of Boston. Lat. 43. 29. N. long. 72. 30. W. Population 2757.—4. A township of the United States, in Hillsborough county, New Hampshire. Population 238.—5. A township of Berkshire county, Massachusetts; 120 miles west of Boston. Population 1108.—6. A post township of Hartford county, Connecticut; 7 miles north of Hartford. Population 2868.—7. A post township of the United States, in Browne county, New York, on the Susquehanna; 125 miles south-west of Albany. Population 1960.—8. A post township of the United States, in York county, Pennsylvania. Population 1739.—9. Of Ashtabula county, Ohio; 25 miles north-west of Warren.—10. A post town of the United States, and capital of Bertie county, North Carolina, on the Cashie; 23 miles west-south-west of Edenton.—11. A town of Nova Scotia; 25 miles north-west of Halifax.—12. A township of Lower Ca-

nada, in the county of Buckingham, on the east side of the river St. Francis. Population 50.

WINDSOR, EAST, a post township of the United States, in Hartford county, Connecticut, nearly opposite Windsor. Population 3081.—2. A township of the United States, in Middlesex county, New Jersey. Population 1747.

WINDSOR, WEST, a township of the United States, in Middlesex county, New Jersey. Population 1747.

WINDSOR, NEW, a borough and market town of England, in the county of Berks, situated on the river Thames, 22 miles from London. The earliest authentic information concerning its history is contained in a charter of Edward the Confessor's, by which it was granted, with various other lands, to the monastery of St. Peter, Westminster. This valuable gift continued but a short time in the possession of the abbey. William the Conqueror was no sooner established on the throne, than he observed the beauties of this situation, and quickly prevailed on the abbot to exchange it for certain lands and manors in Essex. Thus it was again vested in the crown, where, with the exception of the time of the commonwealth, it has ever since remained. This town consists of six principal streets, and several inferior ones. The former are well paved and lighted; and to defray the expense a small rate is levied on the inhabitants, by commissioners appointed under the authority of an act passed in the year 1769. The guild-hall is a stately fabric, supported with columns and arches of Portland stone. The room wherein the corporations meet for the transaction of public business, is spacious and convenient. It is adorned with the portraits of the sovereigns of England, from James I. to Queen Anne; and also with those of George Prince of Denmark, Prince Rupert, Archbishop Laud, &c., and lately with those of George III. and Queen Charlotte, presented to the corporation by his present majesty George IV. In a niche on the north side of this structure, is a statue of Queen Anne, dressed in her royal robes, and supporting the globe and sceptre. This was executed at the charge of the corporation, from motives of gratitude to the Queen, who always resided at Windsor during the summer. In another niche, on the south side, is the statue of Prince George of Denmark, her Majesty's consort, in a Roman military habit, erected by Sir Christopher Wren in the year 1713. In the area under the hall, the corn-market is held weekly. The church, which has been recently rebuilt, is a neat, handsome, Gothic building. A good organ, removed from St. George's chapel, was presented to the parish by his late Majesty. The donations for the use of the poor have been very numerous; and the funds being assisted by some grants from the crown, have occasioned the rates for their support to be less burdensome here than in many other places. In the year 1706 a neat free-school was erected on the north side of the church, for 36 boys and 24 girls, who are clothed and educated, partly by subscription, and partly by the income arising from several legacies. The buildings in this town are chiefly of brick. In the year 1784 his Majesty was presented with a piece of land by the corporation, for the erection of an hospital for sick soldiers. The building was begun and completed the same year. It consists of two wards, sufficiently spacious to accommodate upwards of 40 men, with some additional apartments for the use of the attendants. This institution has lately been removed to a more convenient situation, near the cavalry barracks. In the summer of 1805, a small yet elegant theatre was erected here. The system adopted by administration to concentrate the military force, was carried into effect at Windsor in the year 1795, when extensive and convenient barracks were built for 750 infantry; and a large building has been since erected for the reception of about 400 cavalry.

Windsor contains many handsome buildings; but its chief ornament is its castle, which owes its origin to William the Conqueror, who had no sooner negotiated the exchange before mentioned, than he erected a fortified mansion or palace on this spot, as a hunting seat. He also designed the parks, extending the boundaries of the forest, and established rigid laws for the preservation of the game. Henry I. considerably

ably improved the edifice which his father had erected, enlarged it with additional buildings, and, for greater security, surrounded the whole with a strong wall. The alterations made by this prince were so important and numerous, that many writers have given him the honour of founding the castle. Henry II. held a council or parliament here in the year 1170; and when Richard *Cœur de Lion* departed, on his romantic expedition to the Holy Land, the Bishop of Ely (to whom, in conjunction with the Bishop of Durham, the monarch had entrusted the government of his kingdom) made it his place of residence. King John also resided here during his contest with the barons, who, in the year 1216, besieged it without success. In the next reign it was delivered to them by treaty; but in the ensuing year, was surprised, and made the rendezvous of the king's forces. Edward III. was also born at Windsor; and to his affection for his birth-place the castle is indebted for its present magnitude and grandeur. The improvements made by this prince extended to nearly the whole of the ancient fabric, which, with the exception of the three towers at the west end of the lower ward, was entirely taken down, and the chief part of the structure, as it now stands, erected on its site. In the year 1357, the celebrated William de Wykeham was appointed to superintend the works, with the salary of a shilling daily, and three shillings per week for his clerk. The conduct of the supervisor obtained the approbation of the monarch, who, in 1360, gave him complete authority over every thing connected with the castle, as well as the unlimited jurisdiction of the manors of Old and New Windsor. Windsor castle is most delightfully situated on the summit of a hill, whose base towards the north is laved by the pellucid waters of the Thames. The prospects to the east, west, and north, are extensive and beautiful, being enlivened by the windings of the river, and variegated with elegant mansions, luxuriant meadows, and gentle eminences, covered with the rich foliage of innumerable woods. On the south, the view is bounded by the wild and picturesque scenery of the forest. On the declivity of the hill on which the castle is built, is a terrace, faced with a rampart of freestone, being 1870 feet long. Adjoining this walk is a gate leading into the parks, which are four miles in circumference, and surrounded by a brick wall. The castle is divided into two courts or wards, with a large round tower or keep between them, the whole occupying about 12 acres of land, and having many batteries and towers for its defence. The upper court is a spacious quadrangle, composed of the round tower on the west, the private apartments of their majesties, &c. on the south and east, and the royal apartments, usually shewn to strangers, St. George's-hall, and the chapel royal, on the north. Beneath the statue is a curious hydraulic engine, to draw water for the castle. The keep or tower is the lodging of the constable or governor, built in the form of an amphitheatre, ascended by a flight of stone steps. Here is the guard-room or magazine for arms, curiously arranged. Over the chimney is carved in lime-wood, the star and garter, encompassed with daggers and pistols. These consist of whole, half, and quarter pikes, with bandoleers of various figures, and some of the first matchlocks that ever were constructed. The pillars of the door which leads to the dining-room, are composed of pikes, on the tops of which are two coats of mail, said to have been worn by John, king of France, and David, king of Scotland, when prisoners in the castle. They are inlaid with gold: that belonging to the former prince is ornamented with *fleurs des lis*; that worn by the latter with thistles. The lower court is larger than the upper, and is divided into two parts by St. George's chapel, which stands in the middle, and is reckoned one of the finest Gothic structures of the kind known. On the north side of this court are the houses and apartments of the dean and canons, and other officers; and on the west side are the houses of the poor knights of Windsor. These poor knights, 18 in number, have a premium of 18*l.* per annum, and annually a gown of scarlet cloth, with a mantle of blue or purple cloth, on the sleeve of which is embroidered the cross of St. George.

The royal apartments are on the north side of the court, called the star building, from having the star and garter in gold on the outside. The entrance is from the upper ward, through a handsome vestibule, which has undergone a total alteration, from designs by Mr. James Wyatt. Almost every room in this division of the castle is ornamented with paintings. Many of these, however, are not original; and others are of inferior merit. The first room is called the queen's guard chamber, the ceiling ornamented with the figure of Britannia, in the person of queen Catherine of Portugal, consort of Charles II. seated on a globe, bearing the arms of England and Portugal; with many beautiful accompanying paintings: here is curiously disposed a variety of warlike instruments. The queen's presence chamber contains portraits of James I. by Vanduyck, and Edward III. and his son the Black Prince, by Belcamp. The ceiling also represents queen Catherine, attended by the virtues, supported by Fame, sounding the happiness of Britain, &c. On the ceiling is also the queen's person, as Britannia in a car, drawn by Swans. The tapestry of this room is of a rich gold ground, made at Coblentz, and presented to Henry VIII. The canopy is of velvet: here are also beautiful paintings by the most celebrated masters. On the ceiling of the ball-room, Charles II. is represented giving freedom to Europe; and the tapestry represents the 12 months of the year. In this room is a large silver table. The queen's drawing room is beautifully decorated with paintings, and hung with tapestry, representing the seasons of the year. In the queen's bed-chamber, the ceiling represents the story of Endymion and Diana, from Ovid. The state bed was set up by order of queen Charlotte; the inside is of white satin, and the curtains a pale green, beautifully embroidered: it is said to have cost 14,000*l.* The room of beauties is so named, from being a collection of portraits of the most celebrated beauties in the reign of Charles II.; 14 in number. The queen's dressing-room is neatly fitted up, and hung with a tapestry of British manufacture. Belonging to this room is a closet, in which is deposited the banner of France. This is annually presented on the 2d of August, by the heir of the great duke of Marlborough. By the observance of this tenure, the possession of the magnificent palace of Blenheim, which was built at the expense of the nation, and given to the duke as a reward for his services, is continued in that family. In this apartment also are some beautiful cabinet pictures, particularly two heads, finely penciled, by Denner; a pair of landscapes, Teniers; an old woman watering flowers, Gerard Douw; and the inside of a cottage, with a girl playing on a spinnet, Mieris: the pictures of this artist are always finished with extraordinary care and minuteness of penciling. The tea equipage that belonged to queen Anne is likewise preserved in this closet. The king's audience chamber is fitted up and furnished in the most elegant manner. The throne and its appendages are constructed with much taste; but the most valuable decorations of this apartment are the seven historical paintings, illustrative of the principal events which distinguished the reign of Edward III. These interesting pictures were executed by command of his late majesty. The whole of these paintings are by Mr. West, who executed them in the years 1787, 1788, and 1789. The king's presence chamber is ornamented with several portraits. In the king's guard chamber is a great variety of warlike instruments, fancifully disposed in columns, pillars, circles, shields, and other devices. Among the coats of mail is one that was worn by Edward the Black Prince. In this room are also eight views of battles, sieges, &c. by Rugendas; and a portrait of Charles XI. king of Sweden, by Van Wyck. The monarch is portrayed on a prancing steed. In the back ground is a representation of a battle, rendered admirable by its grouping, colouring, and spirited drawing. In this apartment is the flag annually sent on the 18th of June, by the duke of Wellington in commemoration of the battle of Waterloo. On the ceiling of the room formerly the king's bed-chamber, is a painting of Charles II. in the robes of the garter, under a canopy, supported by Time, Jupiter, and Neptune:

Neptune: the state bed, now removed to the room late the public dining-room, is of rich flowered velvet, manufactured in Spitalfields, by order of queen Anne. The king's drawing-room represents Charles II. in a triumphal car, drawn by the horses of the sun, attended by Fame, Peace, &c.; in other parts of the ceiling are the labours of Hercules. Here is also a magnificent glass of English manufacture, being 11 feet by 6. On the ceiling of the apartment formerly the king's public dining-room, but now converted into a bed-chamber, is the banquet of the gods. The carving of this room is most beautiful, representing fish, fowl, fruit, &c. doné in lime-wood. St. George's hall is set apart entirely to the honour of the most illustrious order of the garter. The centre of the ceiling is a large oval, wherein is represented Charles II. in the full uniform of the order, attended by the three Kingdoms, Religion, Peace, and various other figures; with the devices and motto of the order. At the back of the sovereign's throne is a painting of St. George encountering the dragon, and on the lower border is inscribed "*Veniendo restituit rem,*" alluding to king William, who is painted under a royal canopy, in the habit of the order, by sir Godfrey Kneller. This painting is now nearly obliterated by various alterations. The ascent to the throne is by five steps of marble. On the north side of the chamber is a painting of the triumph of Edward the Black Prince; and at the upper part of the hall is a representation of Edward III. on his throne, receiving the kings of France and Scotland captives. This, with several others of the pictures in this hall, is by Verrio, an artist employed by Charles II.; and they are generally thought to be over-done, and extravagant in their style. The length of this superb chamber is 108 feet. The chapel of St. George was erected by Edward III., on the site of a smaller structure, built by Henry I., and dedicated to Edward the Confessor. The origin of its magnificence, however, may be attributed to Edward IV., by whom it was very considerably enlarged, and rendered one of the most beautiful structures of that era. In the reigns of Henry VII. and his successor, it underwent several alterations; but it is indebted for the improved and highly elegant state in which it now appears, to the taste and munificence of George III., who expended nearly 20,000*l.* in its repairs and embellishments. At this period it may be considered as the most complete and elegant specimen of what Mr. Warton termed the florid Gothic, in the kingdom. The inside of the chapel is singularly neat. The roof is an ellipsis, composed of stone, and admirably executed. The pillars are of the ancient Gothic kind; the ribs and groins that support the ceiling are disposed with considerable judgment. The interior space is formed into a choir, a nave, and correspondent aisles. The whole ceiling is decorated with heraldic insignia, intermingled with the arms of many sovereigns and knights of the garter, beautifully emblazoned. The nave is separated from the choir by the organ gallery. The roof and columns that support the loft, form a light and elegant colonnade, perfectly in unison with the rest of the chapel, and embellished with appropriate devices. The screen was made from the designs of Mr. Emlyn, and is composed of Coade's artificial stone: the expense of its erection is said to have amounted to 1,500*l.* The organ was built by Mr. Green, and the organ case by Mr. Emlyn: the latter is richly ornamented. The choir may be regarded as a pattern of the most admirable workmanship. It was built by Edward III. but greatly improved during the reigns of Edward IV. and Henry VII. The vaulting of the roof was not completed till the latter end of the year 1508. This division of the structure is appropriated to the more immediate worship of the Deity; to the installation of the knights of the garter, and to the preservation of their names and honours. The stalls of the sovereign, and companions of the order, are ranged on each side the choir. Formerly their number was 26, but is now increased to 40, including the sovereign, the royal dukes, and foreign princes. The ancient stall of the sovereign was removed in the year 1788, and a new one, highly decorated with tracery, erected under the direction of

Mr. Emlyn. In the centre are the arms of the king, encircled with laurel, and crowned with the royal diadem; the whole is surrounded with *fleurs des lis*, the letters G. R. and the star of the order. The curtains and cushions are of blue velvet, fringed with gold. The stalls of the knights display a profusion of rich carved work. On the pedestals is a series of delineations, representing the history of the Redeemer, from his nativity to his ascension; and on the front of the stalls, at the west end of the choir, the actions of St. George are pourtrayed. The mantle, helmet, crest, and sword of each knight, are placed on the canopies of their respective stalls. Over the canopies, the banner or arms of the knights are displayed, elegantly emblazoned on silk; and at the back of each stall are the titles of the personage to whom it belongs, with his arms neatly engraved, and blazoned on copper. The sovereign's banner is of rich velvet, and much larger than those of the knights: the mantling is of rich brocade. The carved work of the choir abounds with variety of imagery, and several figures of saints, patriarchs, and kings: these, previous to the late repairs, were much mutilated, but have since been restored to nearly their original state. The altar is embellished with a painting of the Last Supper, by West, which is a very masterly composition, and executed with great taste and judgment. The beautifully carved wainscot surrounding the altar, was designed by Mr. Thomas Sandby, and executed under the inspection of Mr. Emlyn. It contains the arms of Edward III. Edward the Black Prince, and those of the original knights of the garter, with various symbols of the order, displayed within two circular compartments. The ornaments consist of pelicans, grapes, wheat, sacramental vessels, and other devices, judiciously disposed, and executed with considerable taste. The altar was formerly adorned with rich hangings of crimson velvet and gold, but was disrobed of its splendid furniture in the year 1642, by captain Fogg, under pretence of parliamentary authority. At the same time also, it was plundered of the numerous gold vessels which the munificence or piety of successive sovereigns and knights of the garter had here consecrated to religious uses. The plate thus seized is said to have weighed 3580 ounces, and to have been wrought in a very exquisite manner. On the restoration of Charles II. a subscription was opened, and every requisite for the re-establishment and service of the altar, supplied from the liberal contributions of the sovereign and knights of the garter, and other benevolent persons. Several windows of this superb fabric are beautifully painted, and, for general composition, brilliancy of colour, and correct execution, rival most embellishments of a similar nature in the kingdom. The subject of this painting, which is of superior excellence, is the Resurrection. The east window of the south aisle is painted with a very animated representation of the angels appearing to the shepherds; and the west window of the north aisle is decorated with a representation of the adoration of the Magi. This chapel has been the burial-place of several royal and illustrious personages. At the east end of the north aisle the remains of Edward IV. are deposited. Over his tomb is a beautiful monument of steel, representing a pair of gates between two towers, curiously worked. On the 13th of March, in the year 1789, the workmen employed in repairing the chapel, perceived a small aperture in the side of the vault where Edward was interred. This was soon rendered sufficiently large to admit an easy entrance; and on the interior part being laid open, in presence of the surveyor and two of the canons, the skeleton of the monarch was found inclosed in a leaden and a wooden coffin; the latter measuring six feet three inches in length. Henry VI. was also buried in this chapel, near the choir door in the opposite aisle. Here lie interred under the choir, the bodies of Henry VIII. and Jane Seymour, Charles I. and a daughter of Queen Anne. Many other distinguished persons are interred within this fabric. Adjoining the east end is a neat building, erected by Henry VII. as a burial-place for himself and successors; which is now the royal mausoleum, and in which their late majesties, princess Charlotte,

lotte, and others, have been interred. A most sumptuous monument was formerly erected here by cardinal Wolsey; but he dying at Leicester, was there privately buried. On the south side of this town is Windsor Great-Park, well stocked with deer, in which is situated His present Majesty's cottage. It was 14 miles in circumference, but has been lately much enlarged by the inclosure act. The entrance is by a road called the Long Walk, near three miles in length, through a double plantation of trees on each side, leading to the rangers' lodge. Queen Elizabeth's walk herein is much frequented. At the entrance of this park is the queen's lodge, of recent erection. This building stands on an easy ascent, opposite the upper court, on the south side, and commands a beautiful prospect over the surrounding country. The gardens are elegant, and have been much enlarged by the addition of the gardens and house of the duke of St. Alban's, lately purchased by His Majesty. Windsor forest being a circuit of 56 miles, was originally formed for the exercise of the chase, by our ancient sovereigns: and this was also a favourite amusement of his late majesty. Edward I. constituted the town a free borough, and invested its inhabitants with several privileges, which were afterwards confirmed and enlarged by succeeding monarchs. The corporation consists of from 28 to 30 brethren: 10 of whom are denominated aldermen; the remainder benchers and burgesses. The mayor and justice are annually chosen from the aldermen; and on the same day two bailiffs are elected from the burgesses. Besides these, the mayor, bailiffs, &c. are empowered to choose a high steward, chamberlain, under steward, town-clerk, and other subordinate officers. This borough sent members to parliament in the 30th year of Edward I. and again in the 7th of Edward II. From that time till the 25th of Henry VI., there appears to have been no return; since that period it has been regularly represented. The right of election was originally vested in the corporation; but this privilege being occasionally contested, was at length overturned in the year 1690, and the liberty of voting extended to all the inhabitants paying scot and lot. The number of voters is about 400. The market is held on Saturday, in an area beneath the town-hall, and is well supplied with all kinds of provisions, fish, &c. Its fairs are Easter Tuesday, the 5th July, and 24th October. The population of the borough, including the castle, is about 5000; 20 miles east-by-north of Reading, and 22½ west-by-south of London.

WINDSOR, OLD, a small village of England, in Berkshire, on the Thames, to the south-east of New Windsor, and adjoining thereto. Here are several elegant houses on the banks of the river; and it has a church, near a mineral spring called St. Peter's well. This was anciently the residence of the Saxon kings; and that part called New Windsor has chiefly risen since the reign of William I. Population 932.

WINDSOR CREEK, a river of North America, which runs into the Missouri; 190 miles below the Great Falls.

WINDSOR FOREST, an extensive forest in the east part of Berks, about 50 miles in circumference. It contains several villages, of which Wokingham, or Okingham, near the centre of the forest, is the principal; and though the soil is generally barren and uncultivated, it is finely diversified by hills and dales, woods, lawns, and delightful villas.

WINDSOR RIVER, a river of the United States, in Connecticut, which runs into the Connecticut; 4 miles north of Hartford.

WINDTIGHT, *adj.* Fenced against winds.—Cottages in a valley, though not high-built, yet *wind-tight*, and water-tight. *Bp. Hall.*

WINDWARD, *adv.* Towards the wind.

WINDWARD, *adj.* Lying towards the wind.

WINDWARD, *s.* Point towards the wind.—I observed to the *windward* of me a black cloud falling to the earth in long trails of rain, which made me betake myself for shelter to a house. *Tatler.*

WINDWARD ISLANDS, in opposition to Leeward.

These islands, in the West Indies, extend from Martinico to Tobago.

WINDWARD PASSAGE, a name given to a course from the south-east angle of the island of Jamaica, in the West Indies, and extending from 160 leagues to the north side of Crooked island, in the Bahamas. Ships have often sailed through this channel, from the north part of it, to the island of Cuba, or the gulf of Mexico, notwithstanding the common opinion, on account of the current which is against it, that they keep the Bahama shore on board; and that they meet with the wind in summer for the most part of the channel easterly, which, with a counter current on shore, pushes them easily through it.

WINDWARD POINT, a cape on the north-east coast of the island of St. Christopher. Lat. 17. 23. N. long. 62. 22. W.

WINDY, *adj.* Consisting of wind.

See what showers arise,
Blown with the *windy* tempest of my soul
Upon thy wounds, that kill mine eyes and heart.

Shakspeare.

Next the wind.

Lady, you have a merry heart,
— Yes, my lord, I thank it, poor fool,
It keeps on the *windy* side of care.

Shakspeare.

Empty; airy.

Why should calamity be full of words?
— *Windy* attorneys to their client woes,
Poor breathing orators of miseries.

Shakspeare.

Tempestuous; molested with wind.

On this *windy* sea of land the fiend
Walk'd up and down.

Milton.

Puffy; flatulent.—In such a *windy* colic, water is the best remedy after a surfeit of fruit. *Arbuthnot.*

WINE, *s.* [*vin*, Saxon; *vinn*, Dutch.]—The fermented juice of the grape.

The *wine* of life is drawn, and the mere lees
Is left this vault to brag of.

Shakspeare.

Preparations of vegetables by fermentation, called by the general name of *wines*, have quite different qualities from the plant; for no fruit, taken crude, has the intoxicating quality of *wine*. *Arbuthnot.*

Wine, using the term itself as the produce of the grape, was first made in Persia. Thence it passed into Egypt and Asia Minor, countries which had hitherto enjoyed only beer and palm-wine. Among the Greeks and the Romans the process of wine-making was carried to a high degree of perfection, if indeed we may judge of their excellence from the rapturous encomiums of the classic poets. At all events the ancient wines were very numerous, and of various flavours.

In the treatment of the produce of the grape, there is much to distinguish the moderns from the ancients. Indeed in the management of wines, there are so many essential and curious points of opposition, that we cannot be brought to conceive that the potations of antiquity could be endurable to our tastes. Accident is said to have led to one of, what we should call, the most villainous practices of the ancients. A slave among the Greeks, who had stolen part of the contents of a cask, supplied the deficiency with sea-water, which, on examination, was thought to have improved the flavour of the liquor! But, whatever was the origin of the opinion, a proportion of salt-water was certainly held to be an indispensable component of good wine. Columella praises the mixture in the proportion of about one pint of salt-water, evaporated to a third part, for six gallons of wine; and adds, that he should not hesitate to recommend the common practice of doubling, or even trebling, the saline prescription, if the wine should be strong enough to bear it without betraying a salt taste: but it must be acknowledged there was no small risk. What course of feeding could have reconciled the human palate to such a compound, it would now be in vain to inquire.

But

But we have practical evidence of the tendency of another favourite quackery of the old Greeks. They were fond of largely impregnating their wines with rosin:—the preservation of which practice has had the effect of making many of the modern Greek wines absolutely undrinkable, by any but the natives. It was not unusual to sprinkle a quantity of powdered rosin or pitch on the must during the first fermentation; and after this was completed, to infuse the flowers of the vine, cypress leaves, bruised myrtle-berries, the shavings of cedar and southernwood, bitter almonds, and numberless other articles of an aromatic nature. But a more common mode of proceeding seems to have been to mix all these ingredients, in the first instance, with defrutum or inspissated must, to boil the whole to a thick consistence, and then to add the confection to the new wine. It is almost incredible in what quantities (according to Columella) this vile admixture of rosin and pitch (or liquid tar) was used. Of the aromatic substances, however, which we have enumerated, some are still used with advantage in the perfuming of wines.

At first sight, indeed, it seems difficult to explain, on any principles consistent with a fine taste, how a predilection should come to be entertained for wines to which a quantity of sea-water had been added, or which were highly impregnated with pitch, rosin, turpentine, and a multitude of powerful aromatic ingredients; nor can we well imagine, that their strong wines, even when mellowed by age, could be rendered very exquisite by being exposed in smoky garrets, until reduced to a syrup, and rendered so muddy and thick, that it was necessary to strain them through a cloth in order to free them from impurities, or to scrape them from the sides of the vessels, and dissolve them in hot water, before they were fit to be drunk. But, when we consider the effects of habit, which soon reconciles the palate to the most offensive substances, and the influence of fashion and luxury, which leads us to prefer every thing that is rare and costly, to articles of more intrinsic excellence and moderate price, we may readily conceive, that the Greeks and Romans might have excused their fondness for pitched and pickled wines, on the same plea by which we justify our attachment to tea, coffee, and tobacco. It was long ago observed by Plutarch, that certain dishes and liquors, which at first appeared intolerable, came, in the course of time, to be reckoned the most agreeable; and surely the charge of indulging a perverted taste in wine, would proceed with an ill grace from the people of this country, where a notorious partiality exists in favour of a liquor, of which the harshness, bitterness, acidity, and other repulsive qualities, are only disguised by a large admixture of ardent spirit, but which long use has rendered so palatable to its admirers, that they fancy it the best of all possible wines.

We may suppose the sweet wines of the Greeks (the produce of the various islands in the Egean and Ionian seas) to have been principally of the luscious kind, like the modern Cyprus and Constantia; while, however, several of the dry wines, such as the Pramnian and Corinthian, were certainly distinguished by an extraordinary degree of roughness and astringency, and only became drinkable after they had been kept a great number of years.

Of the principal Roman wines, the names, at least, are familiar with every reader. The Campania Felix boasted the most celebrated growths; and, however minute questions of locality may be determined, the Falernian, Massican, Cæcuban, Setine, and Surrentine wines, were all the produce of that beautiful region. The three first of these have been immortalized by Horace, who has expatiated on their generous qualities with the fervour of an amateur. There seems reason for concluding that they were all strong durable wines, apt to affect the head; the poet, therefore, was no flincher, in such combats at least. The Cæcuban is described by Galen as a generous wine, ripening only after a long term of years. The Massican closely resembled the Falernian, if indeed it were not a kind of the same stock. Of "mighty Falernian" itself, little more is known than that it

was highly prized, was kept for twenty, thirty, or even forty years, and was naturally so strong and rough, that it could only be drunk when thus mellowed by age. The Setine was a light delicate wine; the favourite (according to Pliny) of Augustus, who gave the preference to it as being of all kinds the least apt to injure the stomach. This wine, though not mentioned by Horace, is celebrated both by Martial and Juvenal. These are the only wines of ancient Italy which deserve to be remembered; unless the poetic eulogies of Horace and Juvenal be thought of weight enough to rescue the Albanum from the degradation which Pliny has assigned to it among third rate wines.

Among our present wines, we have no hesitation in fixing upon those of Xeres and Madeira as the two to which the Falernian offers the most distinct features of resemblance. Both are straw-coloured wines, assuming a deeper tint from age, or from particular circumstances in the quality, or management of the vintage. Both of them present the several varieties of dry, sweet, and light. Both of them are exceedingly strong and durable wines; being, when new, very rough, harsh, and fiery, and requiring to be kept about the same length of time as the Falernian, before they attain a due degree of mellowness. Of the two, however, the more palpable dryness and bitter-sweet flavour of the Sherry might incline us to decide, that it approached most nearly to the wine under consideration: and it is worthy of remark, that the same difference in the produce of the fermentation is observable in the Xeres vintages, as that which Galen has noticed with respect to the Falernian: it being impossible always to predict, with certainty, whether the result will be a dry wine, or a sweetish wine, resembling Paxarete. But, on the other hand, the soil of Madeira is more analogous to that of the Campagna Felice, and thence we may conclude, that the flavour and aroma of its wines are similar. Sicily, which is also a volcanic country, supplies several growths, which an inexperienced judge would very readily mistake for those of the former island, and which would, in all probability, come still nearer to them in quality, if more pains were bestowed on the manufacture. Another point of coincidence is deserving notice. Both Xeres and Madeira are, as is well known, infinitely improved by being transported to a hot climate; and latterly it has become a common practice, among the dealers in the island, to force the Madeira wines by a process which is absolutely identical with the operation of the fumarium. It may, perhaps, be objected, that the influence of heat and age upon these liquors, far from producing any disagreeable bitterness, only renders them sweeter and milder, however long they may be kept; but, then, in contrasting them with the superannuated wines of the Romans, we must make allowance for the previous preparations, and the effect of the different sort of vessels in which they are preserved. If Madeira or Sherry, but particularly the latter, were kept in earthen jars until it was reduced to the consistence of honey, there can be little doubt, that the taste would become so intensely bitter, that, to use the expression of Cicero, we should condemn it as intolerable.

"Of spiced wines," says Le Grand in his *Vie privée des François*, "our poets of the thirteenth century never speak without rapture, and as an exquisite luxury. They considered it the master-piece of art to be able to combine in one liquor the strength and flavour of wine, with the sweetness of honey and the perfume of the most costly aromatics. A banquet at which no piment was served would have been thought wanting in the most essential article. It was even allowed to the monks in the monasteries on particular days of the year. But it was so voluptuous a beverage, and was deemed so unsuitable to the members of a profession which had forsworn all the pleasures of life, that the council of Aix-la-Chapelle (A. D. 817.) forbade the use of it to the regular clergy except on days of solemn festivals."

But the wines most in repute in the fourteenth century may be learnt from an enumeration in the metrical romance of the *Squire of Low Degree*.

'Ye shall have rumney, and malmesyne,
Both ypocrasse and vernage wine,
Mount Rose and wine of Greke,
Both algrade and respice eke;
Antioche and bastarde,
Pymment also, and garnarde;
Wine of Greke, and muscadell,
Both claré, pymment, and Rochell,
The reed your stomake to defye,
And pottes of osey set you bye.'

Of these wines, Rumney was probably an Andalusian growth; Malmesyne, a Greek wine, named from Malvagia, in the Morea, from whence the malmsey grape originally came; Vernage, a Tuscan wine of bright golden colour; Monte Rose, Greek Muscadell, Antioch, as also pymment, ypocrasse, and claré, speak for themselves; Algrade was of the Algarves, and Garnarde of Granada; Rochelle was the port from which the wines of Guienne and Poitou were brought to England; Osey, or Osoye (a corruption of Auxois), was of Alsace,—Alsatian wine; Respice (vin rapé) was wine made of unbruised grapes; and Bastard was a Spanish wine.

In the beginning of the last century a ridiculous controversy arose in the French schools of medicine, on the comparative merits of the wines of Champagne and Burgundy. The angry discussion continued at intervals until the year 1778, when a solemn decree in favour of Champagne was pronounced by the Faculty of Medicine at Paris. With the professional justice of the verdict we pretend not to interfere; we abandon 'the dietetic qualities' of Burgundy to their fate. But, for richness and delicacy of flavour and perfume, we will still hold by the Côte d'Or, in spite of all the fathers of physic, and all the canons of science. Yet he who would regale his senses with Burgundy must not confine himself to this side of the channel. The fact is, that the best red growths of the district—the Romanée Conti, Chambertin, Clos Vougeot, Richebourg, and St. George—are all of such exquisite delicacy, that they will not endure exportation. Indeed none of the finer Burgundy wines will bear removal, except in bottle; and even then they are apt to contract a bitter taste, or to turn sour, except treated with the most assiduous care. But even were the choicer growths of harder constitution, they are produced in too small quantity, and are too urgently in request in France, to answer much more than the home demand. Hence what we call Burgundy in England, is only the costly refuse of the red wines of the province. The white wines are much less excellent than the red, but still deserve to be mentioned with respect: particularly those of Montrachet, for their high perfume and agreeable flavour; and the Goutte d'Or (though inferior) for its splendid amber tint.

In passing from Burgundy to Dauphiny and the Lyonnais, we shall have the same remark to repeat of the finer wines of these provinces—that they are seldom drunk in England. The first of them, and among the first in the whole world, are those of the vineyards which, covering the southern aspect of a gravelly hill, overhang the banks of the Rhone, about twelve miles from Valence. It is from the Hermitage, which still crowns the granite summits with its ruins, that the vineyards have derived their celebrated name. The red Hermitage is known for its full body, dark purple colour, and exquisite perfume and flavour, resembling, but excelling in poignancy, that of the raspberry. Its white growths are, perhaps, less precious: as, indeed, white growths almost always are than red, where both are the produce of the same district. The colouring matter, which is contained in the rind of the grape, carries with it to the wine both aroma and flavour, which are lost in the manufacture of the paler liquors. Côte Rôtie, brune and blonde, may perhaps claim to rival, since they resemble respectively, the growths of the Hermitage: they are, however, inferior. But we are insensibly extending our remarks beyond compass, and must pass with a more rapid glance over the remaining vineyards of

France. Of the produce of Languedoc, Roussillon, and Provence, we shall say little, except to remark that it is far from being what it might be rendered; and that, by injudicious culture and treatment, most of these red wines are made to resemble those of Spain in deep and thick colour, fiery strength, and coarseness. We have, however, tasted in its purity some of the growth of St. George d'Orques, near Montpellier, which, for fullness of body, delicacy of flavour, and its velvet repose on the palate, might almost challenge competition with Hermitage. The red strong Roussillons are generally employed for strengthening the lighter growths of the Bordelais, and are good, if not for that, for little else. But the white Muscadines of Languedoc and Roussillon, on the shores of the Mediterranean, are deservedly famous; and we need only mention the well known names of Frontignan, Lunel, and Rivesaltes, which are among the very finest luxurious wines in the world.

We must be brief in our notice of the Bordelais, though its wines deserve much praise. The principal vine tracts of this district are divided into those of Medoc, the Graves, Palus, and the Vignes Blanches. The Medoc vineyards, which extend from Bourdeaux northwards over a sandy and calcareous loam, produce the wines which have given immortality to the names of Chateau-Margaux, Lafite, and Latour. The Graves are the gravelly soils southward of the same city; giving their name to the white wine which they yield; but the Haut Brion, the best, perhaps, of the Bordelais red wines, is also the produce of the same region. The Palus, a bed of rich alluvial deposits between the Garonne and Dordogne, affords stronger and more deeply coloured growths than those of Medoc, with which they are sometimes mingled. But being hard and rough when new, and well adapted for sea-carriage, these are the wines which, under the name of Vins de Cargaison, are sent to the East Indies, to answer the demand for clarets in that country. The Vignes Blanches, or dry white wine district, is known for its Sauterne, Barsac, &c.

The finer red wines of the Bordelais are the most perfect which France produces: though containing little alcohol, they keep well, and even improve by removal; and as the original fermentation is complete, if the subsequent management be judicious, they are much less subject to disorders and acidity than those of Burgundy. But here again let no man in England, while he sips his claret, dream that he is drinking Chateau-Margaux or Haut Brion. The real quantity of the finer growths is so inconsiderable that they could not by any possibility supply a tenth part of that which usurps their name; little can be exported, and perhaps none is, in its purity. A bottle of the best wine is a rarity, for which, even at Bourdeaux, the bon vivant is content to pay six or seven francs. But for the English market, the secondary growths and 'vins ordinaires' of Medoc are bought up and mingled with the rougher growth of the Palus. And even this compound will not reach the proof for our fire-drinkers; and because our mouths have been seared with brandied ports, there must be in Bourdeaux a particular manufacture called travail d'Angleterre: three or four gallons of the inflammable ink of Alicante or Benicarlo, with half a gallon of stum wine and a dash of Hermitage, to every hogshead of Medoc. That the mixture has been suffered to remain guiltless of brandy is a miracle; for the cry among us is still as of yore, in less temperate times, 'claret for boys, port for men, but, if ye would be gods, brandy!' Yet how few even of the best kinds of the mixture imported under the name of claret the wine-dealers will permit us to drink without subsequent adulteration. We only mention a fact of notoriety, that, before the late reduction of duties, the wholesale importation prices of claret in the London markets varied from six to forty-five pounds the hogshead. The permutations by which these are mingled for the retail purchaser are as various as the hundred qualities of the liquor.

We shall have no temptation to linger among the vineyards of Spain, and little more to say of their produce than to express

our detestation of the whole class of their dull heavy red wines. Whether they be known as Tinto, Alicant, Benicarlo, or Catalanian—whether they avow themselves in their own fierce nature—or are latently and murderously present in clarets—or conspire with brandy to impose their liquid fire upon us in the guise of port—they have all our hearty condemnation. Yet Spain has every rich gift of nature for the production of excellent wines. An English traveller in Granada, in 1809, found red wine of the country, in the house of a native gentleman, equal in delicate flavour to Burgundy. But the owner had been compelled to send bottles for it to the vineyard to prevent its being transported to him in sheep-skins smeared with tar; and surrounded by whole forests of cork-trees, he was obliged to import his corks, as well as his bottles, from England! The principal vineyards of Xeres are in the hands of French and English settlers; and to this circumstance alone may the improvement of the produce in late years be attributed. In Spain generally, except in the commercial towns and monasteries, casks, and bottles, and wine-cellar, are almost unknown; the wine is carelessly and dirtily made, rarely kept to acquire age; when it is, instead of mellowing, it can only become muddy and nauseously impregnated with the rancid flavour of the sheep-skin. Some of the sweet growths, and those of Malaga particularly, it is the fashion to praise; but we shall laud none of them. Of all the wines of Spain, we shall rescue only one from judgment, and that shall be the dry old white wine of Xeres. Whether it be known for pure Falernian, or 'merry sack,' or simply for your pale modern Sherry, Pasquil's Palinode saith justly, that

"The life of mirth, and the joy of the earth,
Is a cup of good old Sherry."

Yet it is monstrous that even this fine wine, so powerful in itself, should be defiled with brandy, and if the quantity do not exceed three or four gallons to the butt, it is several years before the wine recovers from its influence and develops its own oppressed flavour. The vitiated taste of the English market is the only excuse for the merchants; for the wine itself cannot require the admixture. Indeed even in its mellowed state, Sherry, containing nearly a fourth part by bulk of alcohol, is too powerful except in moderate quantities for healthful enjoyment; and if we still cling to the national passion for strong liquors, it is only because, in our cold and damp climate, there will always be a majority of days in which the lighter red wines of France will not sit quite pleasantly upon the stomach without a cushion—three or four glasses—of old Sherry or Madeira. Perhaps, to confess the truth, we are old-fashioned enough, of the two rather to prefer the latter; though the prejudice, we know, is running against it. But who that has lived in a warm climate does not know that, under an East or West Indian sun for example, a daily modicum of Madeira is the staff of life?—maintaining the fainting stamina of the European constitution; the nerve of manhood, and the milk of old age.

Of the wines of Portugal we had almost resolved to say not a syllable; lest we should be betrayed into thread-bare discussions on the 'Methuen treaty, and the impolicy of high duties on French wines.' Yet we do think it a serious evil, no matter how produced or how far remediable, that the national taste should have become habituated to the brandied, fiery, deleterious potations which are known as 'common port'; and that 'the man of moderate fortune, who purchases for daily use a cask of good ordinary French wine, at eightpence a gallon, must submit to a tax of more than 1,500 per cent.' This tax may now be 700 per cent. lighter, but still the main evil exists for the consumer: that the market is not open to the equal competition of French and Portuguese wines; that the genuine supply of good Oporto is notoriously and utterly unequal to the demand which the protection occasions for it; and that every temptation is therefore created to mix it with villainous trash, and to cover the adulteration with excessive quantities of brandy. That the genuine wine—not the manufacture of Oporto or London, but the pure growth of the Douro—is excellent, many a cam-

paing connoisseur can testify who has drunk it on the spot, and never recognised Port in the full mellow body, exquisite flavour, and seducing mildness of the native liquor. But after the admixtures and adulterations to which the choice wines of the Alto Douro are subjected, to reduce them to the Port standard, it would be just as reasonable to expect the liquor to be good, as to hope to preserve the delicious qualities, and immeasurably to increase the quantity of true Burgundy—of Romanée Conti and Clos Vougeot—by throwing all the inferior vins-du-pays of the province into one immense vat with them. If the market were thrown open, if the Portuguese grower and merchant were reduced by competition to attend to the improvement of their produce, and to send it uncorrupted to our cellars, we suspect they would find a full sale for all that the banks of the Douro will honestly yield. And however the politician may think, the consumer must regret that the wines of Europe are not fairly set before him for his choice; and that if his pleasures must be taxed, they are not rated according to their value; that, in short, instead of one duty upon all French wines, he may not purchase permission to drink the inferior growths at a price somewhat proportioned to their original cost.

The wines of Germany and Hungary, we shall now speak of. Of the former, the class of Rhine wines alone deserve mention for their excellence and very singular nature. It is along the course of that river, between Mentz and Coblenz, that these are chiefly produced. Here the stream is confined on both sides by lofty uplands of strata, propitious to the grape, covered with extensive vineyards, supporting a numerous population, and giving an air of richness and animation to the scenery which forms an agreeable contrast to the ruins of feudal magnificence that crown the principal heights. The choicest vintages of this country, however, are confined to a small district called the Rhinegau; and to the vineyards of Hockheim, which, though lying on the river Mayn, are usually classed with them as being of like nature and nearly of the same excellence. Hence all the best sorts of the Rhine wines have long been confounded in this country under the general name of Hock; while Rhenish has become the distinguishing term of disrepute for inferior growths. The qualities peculiar to these growths are well known, and appear to form an exception to all received chemical theories: so sharp in flavour as often to occasion an unfounded suspicion of acidity, yet highly agreeable and abounding in delicate aroma; containing very little alcohol, (usually not above ten per cent. by volume,) yet dry and sound; and so extremely durable, that they will keep and improve for almost an indefinite number of years. It was this durability, probably, that introduced the singular custom of storing the Rhine wines in vessels of enormous magnitude. Every one has heard of the great tun of Heidelberg; it was thirty feet in length by twenty in depth, and was yet almost equalled in capacity by some others, for herein lay a point of rivalry among the great proprietors. This method of preserving the wine had perhaps its advantages for the stronger kinds; but it was essential to keep the vessel always full, either by replacing each quantity drawn off with newer wine of similar growth, or by throwing in washed pebbles to fill up the void. In the last century, for want of such precautions, the residue of a cask at Strasbourg, bearing date anno Dom. 1472, was found to have become thick and sour; which would not perhaps have occurred if it had been bottled. Of the growths of the Rhinegau, the best are the Johannisberger, before referred to, the Rudesheimer, Grafenberger, and Steinberger: the better kinds of the Moselle, of similar species, may rank between these and the inferior Rhine wines. Of Hungary, extensively a wine country, the produce, though it might be excellent, is generally bad, from defective culture and management. But fame claims an exception for Tokay, imperial Tokay. Of this peculiar and luscious product of the half-dried grapes of a district round the town of Tokay, all of us have heard, but few tasted; for the wine bears an extravagant price even at Cracow, where the chief deposit is established for the markets of Poland and Silesia. The old wine, or vino vitawno, is

so highly valued, that when the Emperor of Austria wished to make a present of some to the ex-king of Holland, the stock in the imperial cellars was not thought sufficiently aged; and 2000 bottles were obtained from Cracow at seven ducats the bottle.

Of the wines of Greece and Italy, those of Tuscany, where agriculture generally is well conducted, are better than the rest, particularly the Montepulciano; and the Aleatico and other muscadines perhaps deserve a similar commendation. But these, as well as the famous *Lacrima Christi*, which is made in small quantities and chiefly reserved for the royal cellars at Naples, are better known beyond the Alps by name than in reality. Sicily shares the reproach of the neighbouring continent. What might be made of its produce may be learnt from the specimens of Marsala and Mazzara which are met with in this country. But the Sicilian wines which we import, are generally disguised and poisoned with the execrable brandy of the island; and this attempt to give strength to weak wines must always utterly extinguish their flavour. As long as the practice prevails, it is useless to hope for improvement; even though the hills at the foot of mount Ætna be, as described, one vast vineyard producing great varieties of wine.

The wild vine is found almost everywhere in the forests of the United States, and even of Canada, and it flourishes luxuriantly on the banks of the Mississippi and as far north as the shores of Lake Erie. The plant of the Medoc territory has been introduced into culture at Philadelphia, and is said to yield a wine there which sufficiently resembles the inferior growth of the Bordelais to encourage perseverance in the experiment. Some of the French settlers in the southern back states have also succeeded in making tolerable wine from the wild grape. But in New Mexico the culture of the vine has been eminently successful, and the sweet growths of Passo del Norte in particular, are already celebrated in the new world. In California also, where the missionaries in the last century introduced the European plant, a great quantity of good wine is raised of the Madeira kind. In various regions of Spanish South America, notwithstanding the obstacles which the policy of the mother country constantly opposed to the culture of the vine in her colonies, wine has long been made in great abundance. Lima is the seat of a considerable commerce in the native growths of Peru, of which those of Lucomba and Pisco are in greatest request. Those also of the valley of Suamba, in the province of Arequipa, are in great estimation. In Chile the vine grows exuberantly, and the country contains numerous vineyards, of which those of Cuyo rank first in their extent and the quality of the produce. These wines, principally of the red strong class, are carried across the Andes to Buenos Ayres, a distance of a thousand miles, and they afford the principal supply to all Paraguay.

We shall now close our remarks with a point of some interest for the English reader:—we mean the ancient culture of the vine in this island. We shall not care to inquire, whether the vine was planted in Britain while yet a Roman colony. We incline to the opinion that it was; but the question of the precise date of its introduction is unimportant. It is certain, however, on the testimony of Bede, that, as early as the beginning of the eighth century, at least, the country exhibited vineyards on a few spots. They are mentioned in the laws of Alfred and other early documents; and Edgar makes a gift of a vineyard, at Wycet, with the vine-dressers. After the Norman conquest, many new plantations seem to have been made; and among other places, at Chenetone in Middlesex, at Ware in Hertfordshire,—and in the village of Westminster. Even Holburne had its vineyard, which afterwards came into the possession of the Bishops of Ely; and, when the buildings of the city extended in that direction, gave the name to a street which still exists. To all the greater abbeys, in the south of England at least, vineyards appear to have been at later epochs attached. As these monastic edifices were generally placed in fertile and well sheltered vallies, the choicest exposure for the vine might be found in their vicinity; and many of the monks, being

foreigners, would naturally be familiar with the best modes of culture and the means of overcoming the disadvantages of the climate. But the account of William of Malmsbury is incontestable that, in the twelfth century, vineyards were general in England. He praises the fertile vale of Gloucestershire in particular, as yielding abundance of excellent wines, scarcely inferior in sweetness to the wines of France. It is well known that it has been contended, that we should translate *vina* cider, and *vineæ* orchards; but in a subsequent passage the same chronicler distinguishes apple trees and vines as the different growths of the same domain, and describes the vines as either trailed along the ground or trained on high and supported on poles. One would have thought it impossible to mistake all this, yet it has been mistaken. But a thousand other proofs of the manufacture of wine in England, in the middle ages, might be adduced if necessary. Domesday book gives frequent evidence of the distinction between *pomaria* and *vineæ*. There was a vineyard in the king's little park at 'Windlesore,' where wine was made plentifully so late as the reign of Richard II., and paid in tithes to the abbot of Waltham, then parson of the parish. (Stowe, Chron. p. 143.) But the most decisive evidence of all is furnished by the archives of the church of Ely, wherein we have an account of the produce of a vineyard for two or three years: even the number of bushels of grapes sold is recorded, as also the value of the wine; and it is noted that in one unfavourable year, no wine but only verjuice was made. It was probably this uncertainty of climate, which checked the culture of the vine, as we have seen; and when foreign wines were imported in great abundance, the home manufacture, of inferior quality raised at greater cost and with much uncertainty, naturally declined, and soon ceased altogether as a branch of public industry.

But, in our own times, wine has been and is still raised in England as a matter of amusement and experiment. About thirty or forty years ago, Sir Richard Worsley procured some of the hardier species of vines, planted them at St. Lawrence, in the Isle of Wight, on a rocky soil, with a south-eastern exposure, and engaged a vine-dresser from France to superintend their culture. The result was, that in one or two favourable years, a tolerable crop of grapes was obtained; but eventually, the cold springs and early autumns weakened the plants and blighted the produce, and the scheme was soon entirely abandoned. The spot, however, selected by Sir Richard, was not well adapted for the experiment; for notwithstanding the general mildness of the climate of the Isle of Wight, it was severely exposed to the cold winds which prevail in the Channel just when the vine begins to bud. The endeavours of Mr. Hamilton, at Painshill, were more fortunate; and the account of them is very interesting. By good management, that gentleman procured a wine fully equal to the second rates of sparkling and creaming Champagne, which by keeping gained strength, lost its effervescence and sweet flavour, and acquired the dryness of old Rhine wine. Some that Mr. Hamilton kept sixteen years became so like old Hock, that he declares it might have passed for such to any one who was not a perfect connoisseur. This wine, in its Champagne state, was pronounced to be excellent by very good judges, upon whom it passed for the foreign growth. It was then sold to wine merchants at *fifty guineas* the hogshead, and retailed by them for French wine at from four to six guineas a dozen.

That by diligent attention and skilful management, some very respectable imitations of the secondary growths of foreign wines might be raised in this country, will not, therefore, admit of a doubt; though it can never be done successfully from grapes ripened on trellises and walls, as is sometimes attempted. Dr. McCulloch (*Art of making Wine*, p. 228.) has shown how good wine can be made from the unripe fruit, tendrils, and even from the young leaves of the vine; fermented with a proper addition of sugar and cream of tartar; and he appears to consider this domestic manufacture as worthy of regard in an agricultural point of view, for he speaks of the certainty of raising leaves and green fruit in all years,

years, and of the useful and extensive results to be deduced from the cultivation of the vine for this purpose in Britain. But, on the propriety of forming vineyards generally on English estates, we adopt Dr. Henderson's sensible conclusions: that, as long as foreign wines can be obtained at moderate prices, little advantage can accrue from the attempt to supplant the use of them by the produce of English grapes, as of all crops, that of the vine is the most precarious, and, even in some of the French provinces, does little more than repay the expense of cultivation.

WINEBAGO, a lake of North America. Lat. 43. 50. N. long. 87. 46. W.

WINEBAGO RIVER, a river of America, which runs from Winebago Lake to Green Bay, in Lake Michigan. The Winebago Indians inhabit near this river and lake, in about Lat. 43. to 44. N. long. 84. to 89. W.

WINEBAGOES CASTLE, an Indian settlement of the United States, in North-west Territory, near Winebago lake.

WINEBAGOES, or PUANTS, a nation of Indians in North America, who reside on the river Oiscorsin, Rock and Fox rivers, and Green bay, in seven villages. They hunt on the Oiscorsin, Rock river, and the eastern side of the Mississippi, from Rock river to Prairie des Chiens; on lake Michigan, Black river, and the countries between lakes Michigan, Huron, and Superior. Their numbers do not exceed 1300.

WINEDEN, a town of Germany, in Wirtemberg; 12 miles east-north-east of Stutgard. Population 2500.

WINEE, or BLACK RIVER, a river of the United States, in South Carolina, which rises near Camden, and runs south-east into the Great Pedee, 3 miles above Georgetown.

WINEKINE, a river of Guiana, which enters the Orinoco.

WINFARTHING, a parish of England, in Norfolk; 4 miles north of Diss.

WINFIELD, formerly LICHFIELD, a post township of the United States, in Herkimer county, New York; 10 miles south-west of Herkimer. Population 2533.

WINFIELD, or MARLBOROUGH, a post township of the United States, in Marlborough district, South Carolina.

WINFORD, a parish of England, in Somersetshire; 6½ miles south-west of Bristol. Population 751.

WINFORD, EAGLE, a hamlet of England, in Dorsetshire; 7½ miles north-west of Dorchester.

WINFORTON, a parish of England, in Herefordshire, situated on the Wye; 8 miles south-by-west of Kington.

WINFRITH, a parish of England, in Dorsetshire; 8 miles west-by-south of Wareham.

WING, *s.* [zɛhɪŋ, Saxon; *winge*, Danish.]—The limb of a bird by which it flies.

Ignorance is the curse of God,
Knowledge the *wing* wherewith we fly to heaven.

Shakspeare.

A fan to winnow.—*Wing*, cart nave, and bushel, peck, ready at hand. *Tusser*.—Flight; passage by the wing.

Light thickens, and the crow
Makes *wing* to the rooky wood:
Good things of day begin to droop and drowse,
While night's black agents to their prey do rouse.

Shakspeare.

The motive or incitement of flight.

Fearful commenting
Is leaden servitor to dull delay;
Delay leads impotent and snail-pac'd beggary:
Then fiery expedition be my *wing*,
Jove's Mercury, and herald for a king.

Shakspeare.

The side bodies of an army.—The footmen were Germans, to whom were joined as *wings* certain companies of Italians. *Knolls*.—Any side piece.—The plough proper for stiff clays is long, large, and broad, with a deep head and a square earth-board, the coulter long and very little bending, with a very large *wing*. *Mortimer*.—Figuratively, protection:

Vol. XXIV. No. 1665.

generally, but not always, in the plural.—Under the shadow of thy *wings* will I rejoice. *Ps.*

To WING, *v. a.* To furnish with wings; to enable to fly.

The speed of gods
Time counts not, though with swiftest minutes *wing'd*.
Milton.

To supply with side bodies.

We ourself will follow
In the main battle, which on either side
Shall be well *winged* with our chiefest horse. *Shakspeare.*

To transport by flight.

I, an old turtle,
Will *wing* me to some wither'd bough, and there
My mate, that's never to be found again,
Lament till I am lost. *Shakspeare.*

To exert the power of flying.

Warm'd with more particles of heavenly flame.
He *wing'd* his upward flight, and soar'd to fame;
The rest remain'd below, a crowd without a name. *Dryden.*

Struck with the horror of the sight,
She turns her head and *wings* her flight. *Prior.*

To wound a bird in the *wing*: a term among sportsmen.
WING, or WENGE, a parish of England, in Buckinghamshire; 6 miles north-west of Ivinghoe. Population 937.
—2. A parish in Rutlandshire; 4 miles north-east of Uppingham.

WINGATE, or WINDEGATE GRANGE, a township of England, county of Durham; 6½ miles east-south-east of Durham.

WINGATES, a township of England, in Northumberland; 9 miles north-west of Morpeth.

WINGED, *adj.* Furnished with wings; flying.

And shall grace not find means, that finds her way,
The speediest of thy *winged* messengers,
To visit all thy creatures? *Milton.*

Swift; rapid.

Now we bear the king
Tow'rd Calais: grant him there, and there being seen,
Heave him away upon your *winged* thoughts
Athwart the sea. *Shakspeare.*

Fanned with wings; swarming with birds.—The earth cumber'd, and the *wing'd* air dark'd with plumes. *Milton.*

WINGEDPEA, *s.* [*ochrus*, Latin.] A plant. *Miller.*

WINGERWORTH, a township of England, in Derbyshire; 2½ miles south-by-west of Chesterfield. Population 479.

WINGFIELD, a hamlet of England, in Bedfordshire; 3½ miles north-north-west of Dunstable.—2. A township in Kent, near Wrotham.

WINGFIELD, or WINKFIELD, a parish of England, in Wiltshire; 2 miles west-south-west of Trowbridge. Population 331.

WINGFIELD, or WINKFIELD, a village and parish of England, in the county of Suffolk. Near it are the ruins of a noble old castle, moated round. The church, built of various coloured flints and stones, makes a very beautiful as well as uncommon appearance; and the chancel is of a rich style of architecture. It contains several fine monuments of the De la Pole family. It formerly had a college which stood on the south side of the church: the west side of its quadrangle is converted into a farm-house; 5 miles east-by-north of Eye. Population 555.

WINGFIELD, NORTH, a township of England, in Derbyshire; 4½ miles south-south-east of Chesterfield.

WINGFIELD, SOUTH, another parish in the above county; 2 miles west of Alfreton. Population 987.

WINGFOOTED, *adj.* Swift; nimble; fleet.—*Wing-footed* coursers him did bear so fast away. *Spenser*.—*Wing-footed* time them farther off doth bear. *Drayton.*

WINGHAM, a village and parish of England, formerly a market

market town, in Kent, situated near the river Stour. It has a charity school; and in the neighbourhood are several elegant mansions. Fairs 1st May and 1st November; 34 miles east of Maidstone, and 62 east-by-south of London. Population 859.

WINGHAM'S ISLAND, an inconsiderable island on the west coast of North America, about a league long in a north and south direction, and about a mile broad, forming, with the north-west point of Ray's island, a passage apparently navigable, about a league in width, with irregular soundings from 20 to 6 fathoms, until its eastern extent, when the depth suddenly decreases to 3 and $2\frac{1}{2}$ fathoms. On its eastern side, there is a tolerably well sheltered roadstead, with good anchorage. Lat. 60. 40. N. long. 215. 46. E.

WINGRAVE, a parish of England, in Buckinghamshire; 5 miles north-east of Aylesbury. Population 588.

WINGREEN HILL, in Dorsetshire, England, 941 feet high.

WINGSBURY HILL, a hamlet of England, in the parish of Marksbury, Somersetshire.

WINGLESS, *adj.* Not having wings; not able to ascend.—*Wingless* flies, which suck a living out of the corrupt blood of uncleanness. *Junius.*

WINGSHELL, *s.* The shell that covers the wing of insects.—The long-shelled goat-chaffer is above an inch long, and the *wingshells* of themselves an inch, and half an inch broad; so deep as to come down below the belly on both sides. *Grew.*

WINGTON, a hamlet of England, in the parish of Petworth, Gloucestershire.—2. A tything in Southamptonshire, $2\frac{1}{2}$ miles north-west of Christchurch. Population 1083.

WINGY, *adj.* Having wings; resembling wings.

They spring together out, and swiftly bear
The flying youth through clouds and yielding air
With *wingy* speed outstrip the eastern wind,
And leave the breezes of the morn behind.

Addison.

To **WINK**, *v. n.* [pncian, Saxon; *winken*, Dutch.]—To shut the eyes.

Let's see thine eyes; *wink* now, now open them,
In my opinion, yet, thou seest not well. *Shakespeare.*

To hint, or direct by the motion of the eyelids.—You saw my master *wink* and laugh upon you. *Shakespeare.*—To close and exclude the light.

While Hermes pip'd and sung, and told his tale,
The keeper's *winking* eyes began to fail,
And drowsy slumber on the lids to creep,
Till all the watchman was at length asleep.

Dryden.

To connive; to seem not to see; to tolerate.

I, for *winking* at your discords too,
Have lost a brace of kinsmen. *Shakespeare.*

To be dim.

The sullen tyrant slept not all the night,
But, lonely walking by a *winking* light,
Sobb'd, wept, and groan'd, and beat his wither'd breast.

Dryden.

WINK, *s.* Act of closing the eye.

You doing thus,
To the perpetual *wink* for ay might put
This ancient moral. *Shakespeare.*

A hint given by motion of the eye.—Her *wink* each bold attempt forbids. *Sidney.*

WINKBOURNE, a parish of England, in Nottinghamshire; 3 miles north-by-east of Southwell.

WINKEL, a town of Germany, in the duchy of Nassau, on the Rhine; 14 miles west of Mentz. Population 1500.

WINKELMAN (Abbé John), a German antiquary, was born at Stendal, in the Mark of Brandenburg, in 1718. Although born in very humble life he fortunately enjoyed favourable opportunities of cultivating his talents in that department in which he afterwards attained to eminence. He had arrived at the age of 37 years before he was known to the public as an author. His first work was "Reflections on the Imitations of the Greeks in Painting and Sculpture;" and

it was received in a manner that very much contributed to establish his reputation. At the court of Augustus, king of Poland, he was proselyted to the Catholic faith, more, as some have said, by arguments addressed to his worldly interest, than to his spiritual welfare. It is certain, however, that he much wished to visit Italy for the sake of examining those master-pieces of art that were to be found in that country. With this view he left Dresden, and in passing through Florence in 1756, he made a descriptive catalogue of the antiquities in the collection of the celebrated baron de Stosch, which seemed to introduce him with advantage to Rome, whither he proceeded towards the close of this year. His acquaintance with the famous painters Mengs, Bianconi, and several other ingenious artists, forwarded his access to two of the most celebrated literary men at Rome, cardinal Passionei and the prelate Giacomelli; from whose library and learning he derived much useful information, so that he was soon acknowledged as a man of fine taste, and a distinguished connoisseur in works of art. Assuming the ecclesiastical habit, he succeeded the abbé Venuti as keeper of the pope's cabinet of antiquities; and he was also appointed copyist in the library of the Vatican. Under the patronage of the pope, who increased his income out of his privy-purse, he completed his History of Art among the Ancients, and then left Rome in 1768, to visit his friends in Germany, and to revise his work to be translated into French by M. Toussaint, of Berlin. On his return to Rome by way of Trieste, he was assassinated, in June, 1768, by a wretch who had joined him on the road, and who had so far gained his confidence, that he had shewn him some gold medals and valuable presents which he had received at Vienna. The translation of his History of the Arts was completed only in part by Toussaint. Another French translation was published by Huber, professor at Leipsic. It is said that the last French translation is far preferable to the first, as it was made from an enlarged edition of the original, printed at Vienna in 1776, after a MS. left by the author. Among the other works of Winkelman were, "Letters on the Discoveries made at Herculaneum," translated into English by Mr. Gough; "Unpublished Monuments of Antiquity, such as Statues, ancient Paintings, engraved Stones, Bas-Reliefs, in Marble and Terra Cotta," of which there is a French translation from the Italian. Paris, 1808, 3 vols. 4to. with plates; "On Allegory, or Treatises on that Subject," 2 vols. 8vo.; and "Remarks on the Architecture of the Ancients," 8vo. Winkelman's "Letters to his Friends" were published in German, in 2 vols. 8vo., with an account of his life, prefixed by Heyne.—*Nouv. Dict. Hist. Gen. Biog.*

WINKER, *s.* One who winks.—A set of noddors, *winkers*, and whisperers, whose business is to strangle all others offspring of wit in their birth. *Pope.*

WINKFIELD, a parish of England in Berkshire; $5\frac{1}{2}$ miles south-west of New Windsor. Population 1439.

WINKINGLY, *adv.* With the eye almost closed. If one beholdeth the light, he vieweth it *winkingly*, as those do that are purblind; but if any thing that is black, he looketh upon it with a broad and full eye. *Peacham.*

WINKLES. To put on the side of a horse.

WINKOOP'S BAY, or **WINE COOPER'S BAY**, a large bay on the south coast of Java. Lat. 7. 5. S. long. 106. 38. E.

WINKOOP'S ISLAND, a small island near the south coast of Java. Lat. 7. 28. S. long. 106. 36. E.

WINKOOP'S POINT, a cape on the south coast of Java. Lat. 7. 25. S. long. 106. 36. E.

WINKSLEY, a township of England, West Riding of Yorkshire; $4\frac{1}{2}$ miles west of Rippon.

WINLATON, a township of England, county of Durham; 5 miles west of Gateshead. Population 3063.

WINMARLEIGH, a township of England, in Lancashire; 3 miles north-west of Garstang.

WINNALL, a parish of England, in Southamptonshire, near Winchester.

WINNEBAH, a town on the Gold coast of Africa, situated in the Agoona country. The surrounding territory is fertile

fertile and beautiful, resembling a nobleman's park. The place has declined, and its population has fallen from 4000 to 2000 souls. The British had here a small fort, garrisoned by only seven men, which, being wholly out of a condition to defend itself, and indeed quite useless, has been recently withdrawn.

WINNENTHALL, a village of Germany, in Wirtemberg, near Wineden.

WINNER, *s.* One who wins.

Go together,
You precious *wINNERS* all; your exultation
Partake to every one. *Shakspeare.*

WINNERSH, or WINHURST, a hamlet of England, in Berkshire, near Oakingham.

WINNIKI, a village of Austrian Poland, to the south of Lemberg. It has a great manufactory of tobacco and snuff, on account of government. Population 2300.

WINNING, *participial adj.* Attractive; charming.

Yet less fair,
Less *wINNING* soft, less amiably mild,
Than that smooth wat'ry image. *Milton.*

WINNING, *s.* The sum won.—A simile in one of Congreve's prologues compares a writer to a buttering gamester, that stakes all his *wINNINGS* upon every cast; so that if he loses the last throw, he is sure to be undone. *Addison.*

WINNINGE, a river of England, in Lancashire, which runs into the Lune; about 6 miles north-east of Lancaster.

WINNINGEN, a town of the Prussian province of the Lower Rhine, on the Moselle, with 900 inhabitants.

WINNINGTON, a parish of England, in Salop, south-west of Cause Castle.—2. A township in Cheshire; 1 mile north-west of Norwich.—3. A hamlet in Staffordshire; 9½ miles north-west of Eccleshall.

WINNIPIC LAKE, a lake of North America, in Upper Canada, north west of lake Superior. It lies between 50. 30. and 54. 32. N. lat., and between 95. 50. and 99. 30. W. long. It is 217 miles long, including Baskescoggan or Play Green Lake, its northern arm; and is 100 miles broad from the Canadian House on the east side, to Sable river on the west side. It receives the waters of a number of small lakes in every direction, and exhibits a number of small isles. The lands on its banks are said, by Carver and other travellers, to be very fertile, producing vast quantities of wild rice, and the sugar-tree in great plenty. The climate is considerably more temperate here than it is upon the Atlantic coast, 10 degrees farther southward.

WINNIPIC RIVER, a river of North America, in Upper Canada, which runs north-west into the lake of the same name. It is an outlet for the waters of a vast chain of lakes, the chief of which are La Pluie and Lake of the Woods, and is a large body of water, interspersed with numerous islands, causing various channels, and interruptions of passages, and rapids; so that its navigation is very intricate and dangerous. At the bottom of this river there is a provision store of the North-west Company, in Lat. 50. 33. 12. N.

WINNIPSEOGEE, a lake of the United States, in Strafford county, New Hampshire. 20 miles long, and 8, where widest, broad. It is a beautiful lake, of a very irregular form, and contains a number of islands.

WINNIPSEOGEE, a river of the United States, in New Hampshire, which runs from Lake Winnipiseogee, into the Merrimack, south of Sanbornton.

To WINNOW, *v. a.* [winnōpian, Saxon; *evanno*, Latin.] To separate by means of the wind; to part the grain from the chaff.

Were our royal faith martyrs in love,
We shall be *wINNOW'd* with so rough a wind,
That even our corn shall seem as light as chaff,
And good from bad find no partition. *Shakspeare.*

To fan; to beat as with wings.

Now on the polar winds, then with quick fan
WINNows the buxome air. *Milton.*

To sift; to examine.

WINnow well this thought, and you shall find
'Tis light as chaff that flies before the wind. *Dryden.*

To separate; to part.

Bitter torture shall
WINnow the truth from falsehood. *Shakspeare.*

To WINNOW, *v. n.* To part corn from chaff.—*WINnow* not with every wind, and go not into every way. *Ecclus.*

WINNOWE, ST., a parish of England, in Cornwall; 3 miles south-east of Lestwithiel. Population 782.

WINNOWER, *s.* He who winnows.

WINNSBOROUGH, a post town of the United States, and capital of Fairfield county, South Carolina. It contains a court-house and a jail, and about 200 inhabitants; 30 miles north-north-west of Columbia, and 145 north-north-west of Charlestown.

WINNWEILER, a town of Germany, and chief place of the county of Falkenstein, belonging to Austria; 10 miles north-north-east of Kaiserslautern. Population 1000.

WINSCHOTEN, a small but fortified town of the Netherlands, the capital of a district in the province of Groningen; 20 miles east-by-south of Groningen. Population 2700.

WINSCALES, a township of England, in Cumberland; 3½ miles south-east of Workington.

WINSCOMBE, a parish of England, in Somersetshire; 2 miles north-by-east of Axbridge. Population 1113.

WINSLOT, a hamlet of England, in Devonshire, near Torrington.

WINSEN, a town of Germany, in Hanover, on the small river Luhe, which is navigable to this town; 18 miles south-east of Hamburg. Population 1400.

WINSFORD, a parish of England, in Somersetshire; 4½ miles north-by-west of Dulverton. Population 486.

WINSHAM, a parish of England, in Somersetshire; 4 miles south-east of Chard.

WINSHILL, a township of England, in Derbyshire; 11½ miles south-west of Derby.

WINSLADE, a parish of England, in Southamptonshire; 3 miles south-by-east of Basingstoke.

WINSLEY, a hamlet of England, in Wiltshire, near Bradford.—2. A hamlet in the West Riding of Yorkshire, near Ripon.

WINSLOW (James Benignus), an eminent anatomist, was born in 1669 at Odensee, in the isle of Funen, and having studied a year under Borrichius, was sent with a pension from the king of Denmark to seek improvement in the principal universities of Europe. In 1698 he became a pupil of the celebrated anatomist Duverney at Paris, and during his residence in this capital, he abjured Protestantism, and was confirmed by Bossuet, assuming in addition to his own baptismal name that of his converter, Benignus. Haller denominates Winslow "simple and superstitious," and of course his conversion to the Catholic faith afforded no great occasion for triumph. This event, however, detached him from his family and native country, and was the means of fixing his abode in France, where the patronage of Bossuet was highly favourable to his advancement, and served to obtain for him the degree of doctor in 1705. In 1707 Duverney recommended him to be an élève of anatomy in the Academy of Sciences. He afterwards read lectures of anatomy and surgery for Duverney at the royal garden; and, in 1743, was promoted to the professorship in this institution. In the meanwhile he communicated several papers on anatomical and physiological subjects to the Academy of Sciences, by which body, as well as by the Royal Society of Berlin, he was admitted into the number of associates. His great work, mentioned by Haller as superseding all former compositions of anatomy, and entitled "Exposition Anatomique de la Structure du Corps Humain," first appeared at Paris in 1732, 4to. It was frequently reprinted, and translated into various languages; and is still regarded as of standard authority. Winslow planned, but never finished, a larger work, of which

which this was merely an abridgement, and he was also the author of disputations and treatises on particular topics. He died in 1760 at the advanced age of 91. *Haller. Eloy. Gen. Biog.*

WINSLOW, a market town and parish of England, in the county of Buckingham, situated on the brow of a hill, on the road from London to Buckingham. It is a neat, regular, well built town, consisting chiefly of three streets, standing in the directions of east, west, and north. The houses are mostly of brick, and inhabited by labourers and lace-makers. The church is a large pile of building, consisting of a nave, two aisles, and a chancel, with a square tower, embattled at the west end. The town is of very great antiquity, but possesses no objects interesting to the antiquary. Market on Thursday, and 6 annual fairs; 7 miles north-west of Aylesbury, and 50 west-north-west of London. Population of the parish in 1811, 1222.

WINSLOW, a township of England, in Herefordshire; 2½ miles south-west of Bromyard.

WINSLOW, a post township of the United States, in Kennebec county, Maine, on the Kennebec, opposite Waterville; 16 miles north of Augusta, and 196 north-north-east of Boston. Population 658.

WINSOME, *adj.* [pinnum, Sax. from pyn, joy.] Merry; cheerful. Used in the north: in some places pronounced *wunsome*.

WINSTANLEY IN MAKERFIELD, a township of England, in Lancashire; 4½ miles south-west of Wigan. Population 741.

WINSTEAD, a parish of England, East Riding of Yorkshire; 16½ miles east-south-east of Kingston-upon-Hull.

WINSTEAD, a village and parish of the United States, in Litchfield county, Connecticut, in the north-east part of Winchester, containing flourishing manufactures.

WINSTER, a market town of England, in Derbyshire, situated near the rich lead mines. It is a small place, but has a number of cottages scattered round it. The inhabitants are chiefly employed in working the mines. About a mile north of it, at Birchover, are several curious rocking stones, among which is a famous one, which weighs about 50 tons. Market on Saturday; 27 miles north-west of Derby, and 152 north-west of London. Population 847.

WINSTER, a hamlet of England, in Westmoreland; 7 miles west of Kendal.

WINSTER, a river of England, in Lancashire, which runs into the Ken at its mouth.—2. A river in Norfolk, which runs into the Mere, about 12 miles west-north-west of Norwich.

WINSTON, a township of England, in Durham; 6½ miles east-south-east of Barnard Castle.—2. A parish in Gloucestershire; 6 miles north-west of Cirencester.—3. A hamlet in Gloucestershire; 4½ miles south-south-west of North Leach.—4. A parish in Suffolk; 7 miles west-by-south of Framlingham.

WINTER, *s.* [pinter, Saxon; *winter*, Danish, German, and Dutch.] The cold season of the year.

After summer evermore succeeds
The barren *winter* with his nipping cold. *Shakspeare.*

To WINTER, *v. n.* To pass the winter.—The fowls shall summer upon them, and all the beasts of the earth shall *winter* upon them. *Is.*

To WINTER, *v. a.* To feed or manage in the winter.—The cattle generally sold for slaughter within, or exportation abroad, had never been handled or *wintered* at hand-meat. *Temple.*

WINTER is often used in composition.—Shred it very small with thyme, sweet margarome, and a little *winter-savoury*. *Walton.*

WINTERA [so named by Murray from Captain *William Winter*, who brought the bark of this tree from the Straits of Magellan in 1579], in Botany, a genus of the class polyandria, order tetragynia, natural order of magnoliæ (*Juss.*)—Generic Character. Calyx: perianth one-leaved, entire, gaping, inferior. Corolla: petals six, ovate, spreading. Sta-

mina: filaments numerous, cylindric, thicker at the tip, short. Anthers oval, twin, the cells cohering at the very tip only, and fastened to the tip of the filaments. Pistil: germs four, obovate. Styles none. Stigmas flattened. Pericarp: berries four, obovate, subpedicelled, four-seeded. Seeds four, ovate, subtriquetrous.—*Essential Character.* Calyx three-lobed. Petals six or twelve. Germs club-shaped. Styles none. Berries four or eight, obovate.

1. *Wintera aromatica*.—Peduncles axillary, aggregate, subtriflorous; flowers four-pistilled. This is an evergreen tree, higher and larger than an apple-tree, spreading very much both in root and branches. Leaves of a light green, an inch and half long, and an inch broad in the middle, decreasing to both ends, but terminating bluntly. Flowers axillary, two, three, or more together, on peduncles a quarter of an inch long, somewhat like those of the honeysuckle, five-petalled, milk white, and smelling like jasmine.

2. *Wintera granadensis*.—Peduncles axillary, three-flowered, elongated; flowers eight-pistilled. Branches longer than in the preceding. Leaves oblong, beneath more glaucous so as to be almost white; they are also longer.—Found in New Granada.

3. *Wintera axillaris*.—Peduncles axillary, heaped, one-flowered; flowers four-pistilled. The flavour of the whole plant, and especially of the bark, is very acrid and pungent.—Native of New Zealand.

WINTERBEATEN, *adj.* Harassed by severe weather.—He compareth his careful case to the sad season of the year, to the frosty ground, to the frozen trees, and to his own *winter-beaten* flocks. *Spenser.*

WINTERBERG, a town of the Prussian states, in Westphalia; 39 miles south-by-west of Paderborn. Population 1200.

WINTERBERG, or WIMBERG, a town of Bohemia; 77 miles south-by-west of Prague. It has 1300 inhabitants, and a manufactory of the finest glass in Bohemia.

WINTERBOURN, a hamlet of England, in Berkshire; near Speenhamland.

WINTERBOURNE, a parish of England, in Gloucestershire; 6½ miles north-north-east of Bristol. Population 1569.

WINTERBOURNE ABBAS, a village and parish of England, in the county of Dorset. About half-a-mile west of it, on the road from Dorchester, are several stones, placed in a circular form, from 3 to 7 feet high, supposed to have been the remains of a Druid temple; 4½ miles west of Dorchester.

WINTERBOURNE BASSET, a parish of England, in Wiltshire; 7½ miles north-west of Marlborough.

WINTERBOURNE, DANTSEY, another parish of England, in Wiltshire; 3½ miles north-north-east of Salisbury.

WINTERBOURNE, EARLS, another parish of the above county, near the foregoing.

WINTERBOURNE, FARINGDON, or ST. GERMAN'S, a parish of England, in Dorsetshire; 2½ miles south of Dorchester.

WINTERBOURNE, GUNNER, or CHERBOROUGH, a parish of England, in Wiltshire; 4 miles north-north-east of Salisbury.

WINTERBOURNE, ST. MARTIN, a parish of England, in Dorsetshire; 3 miles west-by-south of Dorchester.

WINTERBOURNE, MONKTON, a parish of England, in Wiltshire; 7 miles west-north-west of Marlborough.

WINTERBOURNE, STEEPLTON, a parish of England, in Dorsetshire; 3½ miles west-by-south of Dorchester.

WINTERBOURNE, STROKE, a parish of England, in Wiltshire; 5 miles west-by-south of Amesbury.

WINTERBOURNE, ZELSTONE, a parish of England, in Dorsetshire; 6 miles south-by-east of Blandford Forum.

WINTERBURN, a township of England, West Riding of Yorkshire; 7 miles north-west of Skipton.

WINTERCHERRY, *s.* [*alkekenge*.] A plant. The fruit is about the bigness of a cherry, and inclosed in the cup of the flower, which swells over it in form of a bladder. *Miller.*

WINTERCITRON, *s.* A sort of pear.

WINTERGREEN,

WINTERGREEN, *s.* [*pyrola*, Latin.] A plant. *Miller.*

WINTERHAY, a hamlet of England, in Somersetshire; near Ilminster.

WINTERHEAD, a hamlet of England, in the parish of Shipham, Somersetshire.

WINTERINGHAM, a parish of England, in Lincolnshire; $7\frac{1}{2}$ miles west of Barton-upon-Humber. Population 709.

WINTERINGHAM, LOWER and UPPER, adjoining hamlets of England, in Huntingdonshire, near St. Neot's.

WINTERLY, *adj.* Such as is suitable to winter; of a wintry kind.

If't be Summer news,

Smile to't before; if *winterly*, thou need'st

But keep that count'nance still.

Shakspeare.

WINTERSET, a township of England, West Riding of Yorkshire; 6 miles south-east of Wakefield.

WINTERSTOW, WEST, a parish of England, in Wiltshire; 5 miles east-north-east of Salisbury. Population 677.

WINTERSTOW, EAST and MIDDLE, adjoining hamlets in the foregoing parish, and included therewith.

WINTERTHUR, a small but well built town of Switzerland, in the canton of Zurich. It has a classical school, and a library, containing medals and other antiquities, found, from time to time, in the neighbourhood. The vicinity produces good wine; 21 miles north-west of Constance. Population 3300.

WINTERTON, a parish of England, in Lincolnshire; 8 miles west-south-west of Barton-upon-Humber. Population 821.

WINTERTON, a parish of England, and formerly a market town, situated on the sea coast of Norfolk. The church is a handsome structure, but the houses are indifferently built. The soil here is reckoned the richest and easiest to be ploughed in England. The promontory or cape, near the village, called Wintertonnes, has a light-house on it; 5 miles north-west of Yarmouth. Population 494.

WINTHORPE, a parish of England, in Lincolnshire; 11 miles east-by-north of Spilsby.—2. A parish in Nottinghamshire; $2\frac{1}{2}$ miles north-north-east of Newark.

WINTHROP, a post town of the United States, in Kennebec county, Maine. It is a considerable and flourishing town, and has manufactures of cotton and wool, and also of coppéras; 160 miles north-north-east of Boston. Population 1444.

WINTHROP'S BAY, a bay on the north coast of Antigua.

WINTNEY, HARTLEY, a parish of England, in Southamptonshire; 2 miles south-by-west of Hartford-bridge. Population 771.

WINTON, a small village of England, in Southamptonshire; 3 miles from Christchurch.—2. A township in the North Riding of Yorkshire; 4 miles from Northallerton.—3. A township in Westmoreland; 1 mile north-north-east of Kirkby-Stephen.

WINTON, a post town of the United States, and capital of Hertford county, North Carolina, on the Chowan; 35 miles north-north-west of Edenton. It contains but a few houses.

WINTONBURY, a post village of the United States, in Hartford county, Connecticut.

WINTRINGHAM, a parish of England, East Riding of Yorkshire; $6\frac{1}{2}$ miles east-by-north of New Malton.

WINTRY, *adj.* Brumal; hyemal; suitable to winter.

He saw the Trojan fleet dispers'd, distress'd

By stormy winds, and *wint'ry* heav'n oppress'd.

Dryden.

WINTZENHEIM, a town of France, department of the Upper Rhine, with 2200 inhabitants, who manufacture woollen and cotton; 6 miles south-east of Turkheim.

WINWICK, a parish of England, in Huntingdon and Northampton shires; 7 miles south-west of Stilton.—2. A township in Lancashire; $2\frac{1}{2}$ miles north of Warrington. Population 570.—3. A parish in Northamptonshire; $9\frac{1}{2}$ miles north-north-east of Daventry.—4. A parish in Northamptonshire; 6 miles from Oundle.

VOL. XXIV. No. 1666.

WINY, *adj.* Having the taste or qualities of wine.—Set cucumbers among muskmelons, and see whether the melons will not be more *winy*, and better tasted. *Bacon.*

WINYAW, a bay of the United States, in South Carolina, formed by the junction of the Pedee, Wakkamaw, and Winee. It is 12 miles long.

WINZIG, a small town of Prussian Silesia; 31 miles north-north-west of Breslau. Population 1500.

To WIPE, *v. a.* [*püpan*, Saxon.] To cleanse by rubbing with something soft.

Such a handkerchief,
I'm sure it was your wife's, did I to-day
See Cassio *wipe* his beard with.

Shakspeare.

To take away by tersion.—Calumniate stoutly; for though we *wipe* away with never so much care the dirt thrown at us, there will be left some sulliage behind. *Dec. of Chr. Piety.*
—To strike off gently.

Let me *wipe* off this honourable dew,
That silverly doth progress on thy cheeks.

Shakspeare.

To clear away.

Macduff, this noble passion
Child of integrity, hath from my soul
Wip'd the black scruples; reconcil'd my thoughts
To thy good truth and honour.

Shakspeare.

[*Emungo.*] To cheat; to defraud.—The next bordering lords commonly inroach one upon another, as one is stronger, or lie still in wait to *wipe* them out of their lands.

Spenser.

To WIPE out. To efface.

This blot, that they object against your house,
Shall be *wip'd out* in the next parliament.

Shakspeare.

WIPE, *s.* An act of cleansing.—A blow; a stroke; a jeer; a gibe; a sarcasm.

To statesmen would you give a *wipe*,
You print it in Italic type:

When letters are in vulgar shapes,

'Tis ten to one the wit escapes;

But when in capitals exprest,

The dullest reader smokes the jest.

Swift.

[*Vanellus.*] A bird. *Ainsworth.*

WIPER, *s.* An instrument or person by which any thing is wiped.

The maids and their makes,

At dancing and wakes,

Had their napkins and posies,

And the *wipers* for their noses,

B. Jonson.

WIPPACH, or VIPACCO, a small town of Austrian Illyria, in Carniola, on a river of the same name; 20 miles north-north-east of Trieste. Population 1000.

WIPPER, a river of the Prussian states, in Pomerania, which issues from the lake of Wippenken, and falls into the Baltic below Rugerwald. It serves to convey rafts of wood, and has a small harbour at its mouth.

WIPPER. See WUPPER.

WIPPER, or WUPPER, a river of Prussian Saxony, which rises in the Eichsfeld, flows through the principality of Schwartzburg, and falls into the Saal in Thuringia, above Sachsenburg.

WIPPERFELD, a neatly built village of Prussian Westphalia, in the duchy of Berg, on the Wipper; 19 miles east of Cologne.

WIPPERFURT, a small town of the Prussian province of Cleves and Berg, on the Wipper; 22 miles east-north-east of Cologne. It has 4800 inhabitants, who manufacture some broad cloth, but more cottons.

WIPPINGEN, a small town and castle of Switzerland; 12 miles south-south-west of Friburg.

WIPPRA, a town of Prussian Saxony, in the government of Merseburg; 8 miles west of Mansfield. Population 900.

WIRBALLEN, a small town of Poland; 22 miles east of Gumbinnen. Population 1700.

7 M

WIRBENTHAL,

WIRBENTHAL, a small town of Austrian Silesia; 27 miles north-west of Troppau.

WIRDUM, a village of the Netherlands; 12 miles north of Groningen. Population 800.

WIRE, *s.* [*virer*, French, to draw round. *Skinner*. Icel. *wjrr*; Sueth. *wir*, fila ex orichalco; ab antiquis. *wirra*, implicare. *Serenus*.] Metal drawn into slender threads.

Some roll a mighty stone, some laid along,
And, bound with burning *wires*, on spokes of wheels are hung.
Dryden.

WIRE, one of the smaller Orkney islands, separated from Rousa by a strait, called Wire Sound, about three quarters of a mile in breadth. Lat. 58. 58. N. long. 2. 51. W.

To **WIREDRAW**, *v. a.* To spin into wire.—To draw out into length.—A fluid moving through a flexible canal, when small, by its friction will naturally lengthen, and *wire-draw* the sides of the canal, according to the direction of its axis. *Arbutnot*.—To draw by art or violence.—I have been wrongfully accused, and my sense *wiredrawn* into blasphemy. *Dryden*.

WIREDRAWER, *s.* One who spins wire.—Those who have need of unmixed silver, as gilders and *wiredrawers*, must, besides an equal weight of silver mixed with other metals, give an overplus to reward the refiner's skill. *Locke*.

WIRINGTON, or **WITHERINGTON**, a hamlet of England, in Northamptonshire; $3\frac{1}{2}$ miles north-north-west of Peterborough. Population 387.

WIRKSWORTH, a market town of England, in the county of Derby, situate in a valley surrounded by hills, in an inclosed country, and, unlike the more northerly parts of the county, where stone walls are used, chiefly encompassed with hedges. It is principally supported by working the lead mines; and, to stimulate to adventure, they have a custom, that, within a limited time after the discovery of ore, the person finding it may demand the exclusive privilege of working it from the bar-master, if it is not in any garden, orchard, or highway. After a lapse of the stipulated time, the bar-master may dispose of it to any other person to make trial, so that no mine shall remain unwrought, if any person wishes to take it. They have a standard brass dish, made in the fourth year of Henry VII., from which the others are made, wherewith to measure the lead ore: and a moot-hall was built in 1773, where all mineral causes within the wapentake are tried. A court is also held at the hall twice a year; and the shambles are at the lower part of it. Mill-stones are dug near it, and veins of stibium or antimony are sometimes found. The church of St. Mary has six bells; a Gothic structure of the 14th century, and the only parish church, though there are above 3000 inhabitants. Here is an hospital, endowed with 20*l.* a year, for six poor men, by Anthony Gell, Esq. The town abounds with excellent water, both hard and soft: and there were formerly in the neighbourhood many medicinal springs, which have been lost by draining the mines. A large quantity of Roman coins was found here about 70 years ago, mostly of the earlier emperors, in good preservation. They have some manufactories for cotton and worsted breeches. They have an annual feast in the town, which is held for a week, and commences on Sunday after September 8th, or nativity of the Virgin Mary, to whom the church is dedicated. From an eminence called Alport, a mile and a half south of the town, the Wrekin in Shropshire is visible, though at 50 miles distance. Here is an extensive circulating library. The county magistrates have jurisdiction here, who reside in and near the place. It has a weekly market on Tuesday, and four fairs, on February 18, May 12, September 8, and October 4; 13 miles north-north-west of Derby, and 140 north-west-by-north of London.

WIRAN, one of the Grampians, in Scotland; 7 miles north of Brechin.

WIRSWALL, a township of England, in Cheshire; 10 miles south-west of Nantwich.

WIRTEMBERG, a state in the south-west of Germany, which, since 1806, has borne the title of kingdom, although

its population, after that of Saxony, is the least considerable of any royal state in Europe. It forms part of the old circle of Suabia, having Bavaria on the east, and the long narrow territory of Baden on the west. It extends from Lat. 45. 36. to 49. 45. N. long. 8. 7. to 10. 30. E. Its oblong form, extending, from north to south, is similar to that of the principality of Wales; and its area, about 8000 square miles, is not much greater; but its soil is far more fertile, and its population is at present not under 1,400,000. Its territorial division is into the four circles of the Jaxt, the Neckar, the Black Forest, and the Danube. These are farther divided into 12 small counties, each of which is subdivided into bailiwics. The foundation of this state was the old duchy of Wirtemberg, augmented since 1801, by various towns of the empire acquired, and abbeyes, priories, and other ecclesiastical possessions secularised, in the present age. The towns of Wirtemberg are thinly scattered; the principal are Stutgard, the capital, containing 22,000 inhabitants; Ulm, 15,600; Tubingen, 5700; Hall, 5500; Ludwigsburg, 5500; Biberach, 4500; Kirchheim, 4100; Schorndorf, 3500; Calw, 3400; Creilsheim, 3100.

The great natural features of this country are two masses or ranges of mountains; one called the Black Forest, extending along the western frontier, in a line nearly parallel to the course of the Rhine; the other, less known out of Germany, called the Alp, or Alb, an insulated range of rocky hills, destitute of wood, and, in some measure, of verdure, which begins near the small town of Rotweil, and traverses the kingdom in a north-east direction. On these lofty tracts, the climate is cold and bleak, but the rest of the country is covered with eminences or hills of moderate elevation, intersected by pleasant vallies which enjoy a climate fully as mild and steady as similar parallels of latitude in the north of France, viz. Champagne, Picardy, and Normandy. The two principal rivers are the Danube and Neckar. The other rivers are the Enz, the Muhr, the Kocker, the Jaxt, and the Tauber: the lake of Constance borders an angle of the southern extremity of the kingdom.

This is, on the whole, one of the most fertile tracts in Germany, subject, however, to material discrimination, from its very different degrees of elevation, and consequently of fertility. In the level districts of the north, corn of all kinds succeeds extremely well; but the rugged surface of the Black Forest is fit only for the pasture of cattle; that of the Alb for sheep. Potatoes, hemp, and flax, are cultivated in various parts, particularly in the grounds of medium elevation. Fruits of various kinds abound throughout the country; and complete woods of apple and pear trees are to be seen in different places. The climate has sufficient warmth for the cultivation of the grape; and the native vines have been improved by the introduction of shoots from France, the north of Italy, Hungary, and even from islands in the Mediterranean. The best qualities of the Wirtemberg wine are known in England under the name of Neckar wine. The Black Forest produces abundance of pine and fir, of which considerable quantities are exported. The mineral products of the mountains are iron, silver, copper, coal, and porcelain; but the quantity as yet extracted from the mines is small, except in the case of iron. The manufactures consist of linen and woollen; there are also iron-works, but on a small scale.

The king of Wirtemberg is a member of the Germanic confederation, and holds the sixth place in the diet. The order of succession to the throne, the regulations in the event of a minority, and other fundamental provisions, were determined by a royal ordinance of January 1, 1808: but a much longer time, and more animated discussions, were necessary to define the relative power of the sovereign and his nobility. Matters remained in an unsettled state until 1819, when a mutual compromise took place, and a new constitution was agreed on, essentially free in its principles. The executive power is vested in the monarch, controlled by a representative body. The titled classes are numerous, and still possess extensive privileges; those who had formerly local sovereignty, retaining a share of judicial power, which renders necessary

necessary here the same system of appeal as in other parts of Germany. The aggregate revenue is about 700,000*l.* a sum equal to that of England in the reign of James I. The public debt of Wirtemberg is between 3,000,000*l.* and 4,000,000*l.*

The dukes of Wirtemberg were Protestant until 1772, when the reigning prince became a Catholic, giving, however, to his representative body, the most solemn pledges that no change should be introduced into the religious establishment, and that even no new Catholic churches should be built. In the wars of the French revolution, Wirtemberg was repeatedly traversed by the hostile armies: its territory was, in 1796, the ground chosen for conflicts in the advance, as well as in the celebrated retreat, of Moreau: in 1799 it was the scene of the defeat of the French under Jourdan; in 1800, of their renewed success under Moreau. The treaty of Luneville (February, 1801) was followed next year by a treaty of indemnity, when it suited the politics of France to secure to the duke of Wirtemberg an acquisition of territory, and the rank of elector in the German empire. A similar policy led to a farther extension of his dominions, on the peace of Presburg, in December, 1805; and on joining the Confederation of the Rhine, in 1806, the royal title, with some additional territory, was conferred on him. These honours and acquisitions were necessarily followed by an implicit obedience to the French government; and the Wirtembergers, like their Bavarian neighbours, were doomed to lose the flower of their troops in Russia, in 1812. In the following year, the remainder of the forces fought under the French banners, until the evacuation of Germany, when the allies, having engaged to serve the king in his various acquisitions, received his support in the invasion of France. Since then, Wirtemberg has had no military contest to sustain; and its standing army, amounting, for some time after the peace, to 16,000 men, has lately been subjected to reduction.

WIRY, *adj.* See WIERY.

To WIS, *v. a.* pret. and part. pass. *wist.* [wīſan, Saxon; *wissen*, German; *wysen*, Dutch.] To think; to imagine. *Obsolete.*

Marry with a king,
A batchelor, a handsome stripling too,
I *wis* your grandam had a worser match. *Shakspeare.*

WISARD. See WIZARD.

WISBADEN, a small town of the west of Germany, in the duchy of Nassau; 8 miles north-west of Mentz. It has 3500 inhabitants, with a mansion belonging to the duke, and several other public buildings. It has also some Roman antiquities; in particular, the Heidenische Maur, or Heathen's Wall, which forms part of the works of the place. Whether it be the remains of the entrenchments thrown up by Drusus to cover Mentz or not, it is evidently of great antiquity. Wisbaden derives its name from its celebrated hot springs, which attract every year 3000 or 4000 strangers to the place. Its environs are pleasant, and produce good wine, particularly the species called Emerich.

WISBEACH, a market town of England, in the county of Cambridge, and Isle of Ely, is situated among the fens on the river Ouse or Wis, which flows through it, and falls into the sea at the distance of eight miles. Over this river was built, in 1767, a stone bridge of one elliptical arch, in room of an old wooden one. The church is a spacious fabric, though of very singular construction, it being furnished with two naves and two aisles. The naves are lofty, and separated from each other by a row of light slender pillars, with pointed arches: the aisles are the most ancient, being divided from their respective naves, by low, massy pillars, and semi-circular Saxon arches. On one of the naves is the date of 1586. The tower is generally supposed to have been erected in the year 1111, from the top of the north side being apparently marked with four units, but is evidently of much later workmanship. The sectaries from the established church are not numerous, but are each provided with a meeting-house. They consist of Quakers, Baptists, Anabaptists, and Methodists. The trade of Wisbeach has much increased of late

years, through the improved state of the drainage and navigation of the fens, and the consequent augmentation of the produce and consumption of the country. The average of the exports of corn alone amounts to 100,000 quarters annually. The principal articles of traffic are coals, corn, timber, and wine. The neighbouring lands are in high cultivation, chiefly on the grazing system. The sheep and oxen grow to a great size, and considerable numbers of them are fattened, and sent twice every week to the London market.

The inhabitants are wholly employed in commerce, there being no manufacture of any kind in the place, though the surrounding country, produces large quantities of wool, hemp, and flax. The market is abundantly supplied with poultry, fish, and butcher's meat; and the trade of the town is further promoted by six annual fairs, for hemp and flax, horned cattle, and horses. A canal, which was completed a few years ago, and extends from the river at this town, to the river Nene at Outwell, and thence to the river Ouse at Salter's-Lodge Sluice, opened a communication with Norfolk, Suffolk, and the western counties, and has already benefited the town considerably. Many improvements in the buildings have been made within the last forty years; and when the corporation have completed the custom-house, and erected new structures in the room of the ancient shire-hall and butcher's shambles (built in 1592), but very few towns will be more handsome. The Rose inn, where balls and monthly assemblies are held, has been a place of public reception from the year 1475, at which period it was known by the sign of the Horn; and on one of the out-buildings, erected in 1601, the figure of a horn is yet to be seen. The theatre is in a central situation, and is well adapted for dramatic exhibitions. The education of youth is provided for by a free school, and two charity schools, supported by voluntary contributions. The corporation of Wisbeach emanated from a religious fraternity, styled the Guild of the Holy Trinity, instituted in the year 1374, and possessed of estates for pious and charitable purposes. This establishment shared the general fate of ecclesiastical foundations in the reign of Henry VIII.; but Edward VI. restored the corporation, and in the charter which he granted, directed the inhabitants to assemble annually, and to elect ten men, who were to form the corporation. This charter was renewed in 1610, when the inhabitants were constituted a body corporate, by the style of the burgesses of the town of Wisbeach, and the right of election limited to the possessors of 40 shilling freeholds; 42 miles north-north-west of Cambridge, and 89½ north-by-east of London. Population 6300.

WISBOROUGH, GREEN, a parish of England, in Sussex; 6 miles north-east of Petworth. Population 1421.

WISBY, a seaport and old staple town of Sweden, situated on the west side of the island of Gothland. It was formerly one of the Hanse towns; at present it is a dark and gloomy place, built in the old German style, and containing nearly 4000 inhabitants. It is fortified, and has a commodious, though not large harbour. Lat. 57. 39. 15. N. long. 18. 26. 30. E.

WISCASSET, a post town and port of entry of the United States, and capital of Lincoln county, Maine, on the west side of the Sheepscot. It is pleasantly situated, and contains a court-house, a jail, a meeting-house, an academy, a bank, an insurance office, and has considerable trade. The harbour is generally open all winter. The shipping belonging to this port amount to 16,145 tons; 43 miles north-east of Portland, and 160 north-east of Boston. Population 2083.

WISCHAU, a town of Moravia; 18 miles east-by-north of Brunn. Population 2600.

WISCHNITZA, a small town of Austrian Galicia, in the Bukowine.

WISDOM, [wīsbom, Saxon; *wisdom*, Danish.] Sapience; the power of judging rightly; the knowledge of divine and human things.—As science is properly that knowledge which relateth to the essences of things, so *wisdom* to their operations. *Grew.*

O sacred solitude! divine retreat!
Choice of the prudent! envy of the great!
By thy pure stream, or in the waving shade,
We court fair *wisdom*, that celestial Maid.

Prudence; skill in affairs; judicious conduct.
'Tis much de dares,
And to that dauntless temper of his mind,
He hath a *wisdom* that doth guide his valour
To act in safety.

Young.

Shakespeare.

WISE, *adj.* [wīz, Saxon; *wiis*, Dutch and Danish: from *wījan*, *wissen*, *wysen*, to know. See *To WIS*.] Sapient; judging rightly; having much knowledge.—Heaven is for thee too high; be lowly *wise*. *Milton*.—Judicious; prudent; practically knowing.

The young and gay declining Alma flies
At nobler game, the mighty and the *wise*:
By nature more an eagle than a dove,
She impiously prefers the world to love.

Young.

Skilful; dexterous.—Speak unto all that are *wise* hearted, whom I have filled with the spirit of wisdom, that they may make Aaron's garments. *Exod.*—Skilled in hidden arts: a sense somewhat ironical.—There was an old fat woman even now with me.—Pray, was't not the *wise* woman of Brentford? *Shakespeare*.—Grave; becoming a wise man.—One eminent in *wise* deport spake much. *Milton*.

WISE, *s.* [wīze, Saxon; *wyze*, Dutch; *weise*, Germ.] Manner; way of being or acting. This word, in the modern dialect, is often corrupted into *ways*.

With foam upon thy lips, and sparkling eyes,
Thou say'st and do'st in such outrageous *wise*,
That mad Orestes, if he saw the show,
Would swear thou wert the madder of the two.

Dryden.

WISEACRE, *s.* [It was anciently written *wissegger*, as the Dutch *wiseggher*, a soothsayer.] *Dr. Johnson*.—A wise or sententious man. *Obsolete*.—Pythagoras learned much, becoming a myghty *wyseacre*. *Leland*.—A fool; a dunce.—Why, says a *wyseacre* that sat by him, were I as the king of France, I would scorn to take part with footmen. *Addison*.

WISELING, *adj.* One pretending to be wise: a word of contempt.—This may well put to the blush these *wiselings*, that shew themselves fools in so speaking. *Donne*.

WISELY, *adv.* Judiciously; prudently.

If thou covet death, as utmost end
Of misery; so thinking to evade
The penalty pronounc'd; doubt not but God
Hath *wiselier* arm'd his vengeful ire.

Milton.

The doctors, tender of their fame,
Wisely on me lay all the blame:
We must confess his case was nice,
But he wou'd never take advice.

Swift.

WISEMAN (Richard), was first known as a surgeon in the civil wars of Charles I., and accompanied prince Charles, when a fugitive, in France, Holland, and Flanders. He served for three years in the Spanish navy, and returned with the prince to Scotland, and was made prisoner in the battle of Worcester. After his liberation, in 1652, he settled in London. When Charles II. was restored, he became eminent in his profession, and was made one of the serjeant-surgeons to the king. In May, 1676, he appears, from the preface to his works, to have been a sufferer by ill health for twenty years; but the time of his death is not known. The result of his experience appears in "Several Chirurgical Treatises," fol. 1676, 1686, and in 2 vols. 8vo. 1719. The subjects of these treatises are, tumours, ulcers, diseases of the anus, king's-evil, wounds, gun-shot wounds, fractures and luxations, and lues venerea.—*Gen. Biog.*

WISENESS, *s.* Wisdom; sapience. *Obsolete*.—No less deserveth his wittiness in devising, his pithiness in uttering, his pastoral rudeness, and his moral *wiseness*. *Spenser*.

WISER'S CREEK, a river of North America, which runs into the Missouri; 342 miles below the Great Falls.

WISETON, or WIGSTON, a hamlet of England, in Nottinghamshire.

WISEWALL, a township of England, in Lancashire; 5 miles from Burnley.

To WISH, *v. n.* [wīʃan, Sax.] To have strong desire; to long.—The sun beat upon the head of Jonah, that he fainted, and *wished* in himself to die. *Jonah*.

If all the year were playing holidays,
To sport would be as tedious as to work;
But when they seldom come, they *wish'd* for come.

Shakespeare.

They have more than heart could *wish*. *Psalm*.—To be disposed, or inclined.—Those potentates, who do not *wish* well to his affairs, have shewn respect to his personal character. *Addison*.—It has a slight signification of hope, or fear.—I *wish* it may not prove some ominous foretoken of misfortune, to have met with such a miser as I am. *Sidney*.

To WISH, *v. a.* To desire; to long for.—He was fain to pull him out by the heels, and shew him the beast as dead as he could *wish* it. *Sidney*.—To recommend by wishing.

Had I as many sons as I have hairs,
I would not *wish* them to a fairer death.

Shakespeare.

To imprecate.

If heavens have any grievous plague in store,
Exceeding those that I can *wish* upon thee;
O let them keep it till thy sins be ripe,
And then hurl down their indignation.

Shakespeare.

To ask.—Digby should find the best way to make Antrim communicate the affair to him, and to *wish* his assistance. *Clarendon*.

WISH, *s.* Longing desire.

To his *wish*,

Beyond his hope, Eve separate he spies.

Milton.

A *wish* is properly the desire of a man sitting or lying still; but an act of the will, is a man of business vigorously going about his work. *South*.—Thing desired.

What next I bring shall please thee; be assur'd,
Thy likeness, thy fit help, thy other self,
Thy *wish*, exactly to thy heart's desire.

Milton.

Desire expressed.

Shame come to Romeo!—

—Blister'd be thy tongue

For such a *wish*.

Shakespeare.

I admire your whig-principles of resistance in the spirit of the Barcelonians: I join in your wish for them. *Pope*.

WISHANGER, a hamlet of England, in the parish of Miserden, Gloucester.

WISHART'S ISLAND, an island in the Pacific ocean. This is one of the Solomon islands, and by the Spaniards called Artreguada. Lat. 2. 20. S. long. 150. 55. E.

WISHAW, a parish of England, in Warwickshire, near Sutton Coldfield.

WISHEDLY, *adv.* According to desire. *Not used*.—What could have happened unto him more *wishedly*, than with his great honour to keep the town still. *Knolles*.

WISHER, *s.* One who longs.—One who expresses wishes.—*Wishers* and *woulders* are never good householders. *Proverb*.—With half that wish, the *wisher's* eyes be press'd. *Shakespeare*.

WISHFORD, GREAT, a parish of England, in Wiltshire, near Wilton.

WISHFUL, *adj.* Longing; showing desire.

From Scotland am I stol'n ev'n of pure love,
To greet mine own land with my *wishful* sight.

Shakespeare.

Desirable; exciting wishes.

Nor could I see a soile where ere I came,
More sweete and *wishfull*.

Chapman.

WISHFULLY, *adv.* Earnestly; with longing.—I was weary of this day, and began to think *wishfully* of being again in motion. *Boswell*.

WISHLY,

WISHLY, *adv.* With longing; wishfully. *Not in use.*
Devereux, that undaunted knight,
Who stood astern his ship, and *wishly* ey'd
How deep the skirmish drew on either side. *Mir. for Mag.*

WISINGSOE, an island of Sweden, in the lake of Wetter, belonging to the province of Jonkoping. Population 900.

WISIR, a small island in the Eastern seas, near the west coast of Aroo. Lat. 15. 21. S. long. 134. 51. E.

WISKET, *s.* A basket. *Ainsworth.*

WISLAWA, a small river of Austrian Galicia, which falls into the Dniester.

WISLEY, a parish of England, in Surrey; 2 miles north-east of Ripley.

WISLICA, a town of Poland, on an island in the Nidda, containing 1000 inhabitants; 37 miles east-north-east of Cracow.

WISLOKA, a river of Austrian Galicia, which rises at the foot of the Carpathians, and falls into the San.—Another and larger river of the same name, rises among the same mountains, and flowing north, joins the Vistula.

WISMAR, a seaport in the north of Germany, in the grand duchy of Mecklenburg-Schwerin, on the Baltic, opposite the island of Poel. It is surrounded with a wall and moat; has a safe harbour, though not of sufficient depth for large vessels; and contains 6700 inhabitants. It has a gymnasium and public library, some manufactures of woollens and linens, and a considerable shipping trade, particularly in corn. Wismar is a place of old date, and was formerly one of the Hanse towns 16 miles north of Schwerin, and 30 east of Lubeck. Lat. 53. 52. 54. N. long. 11. 39. 24. E.

WISNICZ, a small town of Austrian Poland; 24 miles east-south-east of Cracow.

WISNICZ, a small town of European Turkey, in Servia, near Belgrade.

WISP, *s.* [*wisp*, Swedish, and old Dutch.] A small bundle, as of hay or straw.

Jews, who their whole wealth can lay

In a small basket, on a *wisp* of hay.

Dryden.

WISPEL, a small town of Friesland, about 16 miles south of Leeuwarden.

WISPINGTON, a parish of England, in Lincolnshire; 4 miles from Horncastle.

WISSE, a small river of Switzerland, which joins the Rhine, near Huningen.

WISSET, a parish of England, in Suffolk; 2 miles north-west of Halesworth.

WISSING (William), was born at Amsterdam in 1656. He received instructions in the art of painting from Dondyns, an historical painter at the Hague, but on leaving that master went to Paris, and in the year 1680 came to England, and assisted Lely in his numerous works. After Lely's death, he became rather a favourite, and promised to become a formidable rival to Kneller. He drew all the royal family, and was particularly favoured by the duke of Monmouth, whose portrait he painted several times. The duke of Somerset also patronized him, and employed him to paint himself and his duchess, and the pictures are now at Petworth.

Wissing was appointed principal painter to James II., and was sent by him into Holland, to paint portraits of William and Mary. He did not long survive his return to England, and died at Burleigh, the seat of the earl of Exeter in 1687, at the age of 31. His heads were painted with softness and delicacy, in a style quite distinct from that of his master, Lely, or his rival, Kneller; too soft indeed, for character; and his larger pictures lack composition and harmony, both in line and colour.

WISSINGSET, a parish of England, in Norfolk. Population 434.

WISSOWITZ, or WYSOWITZ, a small town of Moravia; 50 miles east of Brunn, with 2500 inhabitants.

WIST, *pret.* and part. of *wis*.

WISTANSTOW, a parish of England, in Salop; 9½ miles north-west of Ludlow. Population 669.

VOL. XXIV. No. 1666.

WISTASTON, a township of England, in Cheshire; 2½ miles north-east of Nantwich,

WISTERNITZ, UPPER, a small town of Moravia, on the Bisticza, with 1200 inhabitants; 4 miles east of Olmutz.

WISTESTON, a township of England, in Herefordshire; 7 miles from Hereford.

WISTFUL, *adj.* Attentive; earnest; full of thought. Why, Grubbinel, dost thou so *wistful* seem?

There's sorrow in thy look.

Gay.

It is used by Swift, as it seems, for *wishful*; though it may mean earnest, eager.—Lifting up one of my sashes, I cast many a *wistful* melancholy look towards the sea. *Swift.*

WISTFULLY, *adv.* Attentively; earnestly.

With that he fell again to pry

Through perspective more *wistfully*.

Hudibras.

WISTLETON, a parish of England, in Suffolk, near Dunwich. Population 713.

WISTLY, *adv.* Attentively; earnestly.

Speaking it, he *wistly* look'd on me;

As who shall say,—I would thou wert the man.

Shakspeare.

WISTON, or WISSINGTON, a parish of England, in Suffolk, near Nayland.

WISTON, another parish in Suffolk; 1½ mile west-by-south of Steyning.

WISTON, a parish of England, in Huntingdonshire; 3 miles south-south-west of Ramsey.—2. A township of England, in Yorkshire; 3 miles north-west of Selby. Population 623.

WISTOWN, a parish of Scotland, in Lanarkshire, extending along the banks of the Clyde. Population 836.

WISNIA, a market town of Austrian Poland; 27 miles east of Przemysl.

To WIT, *v. n.* [*witan*, Saxon.] To know; to be known. This word is now only used in the phrase *to wit*; that is to say. Formerly *to weet*.—There is an officer, to *wit*, the sheriff of the shire, whose office it is, to walk up and down his bailiwick. *Spenser.*

WIT, *s.* [*weyt*, Sax. *wit*, Icel. from *wita*; *witan*, M. Goth. *witan*, Sax. to know. *Serenius.*] The powers of the mind; the mental faculties; the intellects. This is the original signification.—Who would set his *wit* to so foolish a bird? *Shakspeare.*

The king your father was reputed for

A prince most prudent, of an excellent

And unmatch'd *wit* and judgement.

Shakspeare.

Imagination; quickness of fancy.—They never meet, but there's a skirmish of *wit* between them.—Alas, in our last conflict four of his five *wits* went halting off, and now is the whole man governed by one. *Shakspeare.*

Cou'd any but a knowing prudent cause

Begin such motions, and assign such laws?

If the great mind had form'd a different frame,

Might not your wanton *wit* the system blame? *Blackmore.*

Sentiments produced by quickness of fancy; or by genius: the effect of *wit*.—All sorts of men take a pleasure to gird at me. The brain of this foolish compounded clay, man, is not able to invent any thing that tends more to laughter, than what I invent, and is invented on me. I am not only witty in myself, but the cause that *wit* is in other men. *Shakspeare.*—A man of fancy.

To tell them wou'd a hundred tongues require;

Or one vain *wit's*, that might a hundred tire.

Pope.

A man of genius.

Nought but a genius can a genius fit;

A *wit* herself, Amelia weds a *wit*.

Young.

Sense; judgment.

Though his youthful blood be fir'd with wine,

He wants not *wit* the danger to decline.

Dryden.

Faculty of the mind.—If our *wits* run the wild-goose chase, I have done; for thou hast more of the wild-goose in

one of thy *wits*, than I have in my whole five. *Shakspeare*.—[In the plural.] Soundness of understanding; intellect not crazed; sound mind.

I had a son
Now outlaw'd from my blood; he sought my life:
The grief hath craz'd my *wits*. *Shakspeare*.

Contrivance; stratagem; power of expedients; invention; ingenuity.—I was like to be apprehended for the witch of Brentford; but that my admirable dexterity of *wit*; counterfeiting the action of an old woman, delivered me. *Shakspeare*.

WIT (De), There were several painters of this name very respectable in their profession. Peter Candido de Wit, born at Bruges in 1548, went to Italy, and became a friend and co-labourer with G. Vasari. He was afterwards employed by the grand duke of Tuscany at Florence, and painted in oil and fresco. The emperor Maximilian invited him to Munich, and there he terminated his career. Gaspar de Wit, his brother, painted small landscapes very highly finished, in which he introduced Italian architectural ruins. Of later date was Emanuel de Wit, born at Alknaer in 1607, and a painter of still life. He afterwards became a painter of architecture and perspective views of churches, &c. which were touched with great clearness, animation, and spirit. He died in 1692. Another of the name, Jacob de Wit, is the flower of the flock. He was born at Amsterdam in 1695, and having exhibited a desire for the pursuit of art, was placed with Van Spiers, an historical painter, for three years. He afterwards went to Antwerp to contemplate the admirable productions of Rubens and Vandyke, which adorned that city; and there he became the pupil of Jacob van Halen, continuing with him two years.

To him we are indebted for the preservation of the composition made by Rubens for four ceilings, divided into thirty-six compartments, in the church of the Jesuits, which was destroyed by lightning in 1718. They have been since engraved from de Wit's sketches by John Prout.

He was employed by the magistrates of Amsterdam in 1736, to adorn their great council-chamber; and his work has had the honour of being applauded by sir J. Reynolds. His sketches for his larger works are touched with great freedom and neatness, and with good colour. He was living in 1744.

WITCH, *s.* [*picce*, Saxon; from the West-Goth. *wita*, fascinare, Serenius; from the Sax. *piccian*, incantare, *Mr. H. Tooke*. Old English *wieche*.] A woman given to unlawful arts.

The night-hag comes to dance
With Lapland *witches*, while the labouring moon
Eclipses at their charms. *Milton*.

[From *pic*, Saxon.] A winding sinuous bank. *Witch* is here the reading of all the old copies of Spenser. Hughes altered it to *ditch*.

Leave me those hills where harbrough nis to see,
Nor holy bush, nor briar, nor winding *witch*. *Spenser*.

To WITCH, *v. a.* To bewitch; to enchant.

'Tis now the very *witching* time of night,
When church-yards yawn. *Shakspeare*.

WITCH ISLAND, one of the smaller Virgin islands; 6 miles east of St. John.

WITCHAM, a parish of England, in Cambridgeshire; 3 miles south of Clithero.

WITCHAMPTON, a parish of England, in Dorsetshire. Population 377.

WITCHCRAFT, *s.* The practices of witches.—People are credulous, and ready to impute accidents and natural operations to *witchcraft*. *Bacon*.—Power more than natural.

If you cannot.
Bar his access to the king, never attempt
Any thing on him, for he hath a *witchcraft*
Over the king in's tongue. *Shakspeare*.

WITCHELM, *s.* A kind of elm. *Scott*.—There's a good deal of virtue in that wand; I fancy 'tis made out of *witch-elm*. *Addison*.

WITCHERY, *s.* Enchantment.—Another kind of petty *witchery*, if it be not altogether deceit, they call charming of beasts and birds. *Ralegh*.

Great Comus?
Deep-skill'd in all his mother's *witcheries*. *Milton*.

WITCHFORD, a parish of England, in the Isle of Ely, Cambridgeshire.

WITCHINGHAM, GREAT, a parish of England, in Norfolk, near Reepham.

WITCHINGHAM, LITTLE, a hamlet in the foregoing parish, and adjoining thereto.

WITCOMBE, a hamlet of England, in the parish of Corton Dinham, Somersetshire.—2. Another hamlet in the same county, parish of Martock.

WITCOMBE, GREAT, a parish of England, in Gloucestershire, near Painswick.

WITCHCRAFT, *s.* Contrivance; invention. *Obsolete*.—He was nobody that could not hammer out of his name an invention by this *witchcraft*, and picture it accordingly. *Camden*.

WITCRACKER, *s.* A joker; one who breaks a jest.—A college of *witcrackers* cannot flout me out of my humour; dost thou think I care for a satire or an epigram? *Shakspeare*.

To WITE, *v. a.* [*wtan*, Saxon.] To blame; to reproach.
The palmer gan most bitterly
Her to rebuke, for being loose and light;
Which not abiding, but more scornfully
Scoffing at him, that did her justly *wite*,
She turn'd her boat about. *Spenser*.

WITE, *s.* Blame; reproach.—His own thought he knew most clear from *wite*. *Spenser*.

WITTELESS, *adj.* Blameless.—Ne can Willie wite the *witeless* herdgroom. *Spenser*.

WITGENSTEIN, a small county in the Prussian states, adjoining the west part of the province of Upper Hesse, belonging to Hesse-Darmstadt. Its area is nearly 200 square miles; its population about 15,000. It belongs to the princes of Sayn-Witgenstein-Witgenstein, and Sayn-Witgenstein-Berleburg.

WITH, *preposit.* [*wið*, Saxon. Serenius refers this preposition to the M. Goth. *withan*, to join; of which Mr. H. Tooke also pronounces it the imperative mood.] By. Noting the cause.

Truth, tir'd *with* iteration,
As true as steel, as plantage to the moon. *Shakspeare*.

Noting the means.—Rude and unpolished are all operations of the soul in their beginnings, before they are cultivated *with* art and study. *Dryden*.—Noting the instrument.—By perflations *with* large bellows, miners give motion to the air. *Woodward*.—On the side of; for; noting confederacy, or favour.—Fear not for I am *with* thee. *Genesis*.—In opposition to; in competition or contest.

I do contest as hotly and as nobly *with* thy love,
As ever against thy valour. *Shakspeare*.

Noting comparison.—Can blazing carbuncles *with* her compare? *Sandys*.—In society; noting connection.—God gave man a soul that should live for ever, although the body be destroyed; and those who were good should be *with* him. *Stillingfleet*.—In company of.—At the instant that your messenger came, in loving visitation was *with* me, a young doctor from Rome. *Shakspeare*.—In appendage; noting consequence, or concomitance.—Men might know the persons who had a right to regal power, and *with* it to their obedience. *Locke*.—In mutual dealing.—I will buy *with* you, sell *with* you, talk *with* you, walk *with* you, and so following; but I will not eat *with* you, drink *with* you, nor pray *with* you. *Shakspeare*.—Noting confidence: as, I trust you *with* all my secrets; or, I trust all my secrets *with* you.—In partnership.

Though

Though Jove himself no less content would be,
To part his throne, and share his heaven *with* thee. *Pope.*

Noting connection.

Pity your own, or pity our estate,
Nor twist our fortunes *with* your sinking fate. *Dryden.*

Immediately after.—*With* that she told me, that though she spake of her father Cremes, she would hide no truth from me. *Sidney.*—Amongst.—Jasper Duke of Bedford, whom the king used to employ *with* the first in his wars, was then sick. *Bacon.*—Upon.—Such arguments had invincible force *with* those Pagan philosophers, who became Christians. *Addison.*—In consent. Noting parity of state.

See! where on earth the flow'ry glories lie:
With her they flourish'd, and *with* her they die. *Pope.*

This preposition might perhaps be exemplified in many more relations, for its use is very frequent, and therefore very lax and various. *With* and *by*, it is not always easy to distinguish, nor perhaps is any distinction always observed. *With* seems rather to denote an instrument, and *by* a cause: thus, he killed his enemy *with* a sword, but he died *by* an arrow. The arrow is considered rather as a cause, as there is no mention of an agent. If the agent be more remote, *by* is used; as, the vermin which he could not kill *with* his gun, he killed *by* poison: if these two prepositions be transposed, the sentence, though not equally intelligible, will be less agreeable to the common modes of speech.—*With* in composition signifies opposition, or privation, except *withal*.—A present natural good may be *parted with*, upon a profitable expectation of a future moral good. *Wilkins.*

WITHAL, *adv.* Along with the rest; likewise; at the same time.

How well supply'd with noble counsellors?
How modest in exception, and *withal*
How terrible in constant resolution? *Shakspeare.*

God, when he gave me strength, to shew *withal*
How slight the gift was, hung it in my hair. *Milton.*

It is sometimes used by writers where we now use *with*, but I think improperly.

Time brings means to furnish him *withal*;
Let him but wait th' occasions as they fall. *Daniel.*

WITHAM, a town of England, in Essex, situated on a branch of the Blackwater. The town is pleasant, and many of the houses recently built, being on the great road to Harwich. This town derives considerable benefit from its thoroughfare. It was first built by Edward the Elder, son of Alfred the Great, and was given by Edward the Confessor to Eustace, earl of Boulogne, as a marriage portion with Goda, his sister. It was afterwards given to the knights templars, who had a preceptory at Cressing, three miles distant. Here is supposed to have been the Roman station *Ad Ansam*, mentioned in Antonine's Itinerary. The church is a neat Gothic structure, containing many ancient monuments, particularly one of sir John Southcot, a judge of the king's bench in the reign of queen Elizabeth. It has a medicinal spring, formerly in great repute. In the neighbourhood are many neat mansions. Market on Tuesday, and its fairs are 14th September, and the Monday before Trinity Sunday; 8½ miles north-east of Chelmsford, and 37½ north-east-by-east of London. Population in 1811, 2352.

WITHAM, a considerable river of England, in the county of Lincoln. It takes its rise near South Witham, a village about 10 miles north of Stamford; and thence flows almost duly north, by North Witham, Coltersworth, through the park of Easton, and to Great Ponton, where another stream joins it from Skillington and Stoke Rochford. At Little Ponton it receives a small brook, and then proceeds on the eastern side of the town of Grantham; whence it flows by Belton Park and Syston, and then turns westerly to Long Bennington. Here it bends again to the north; and after flowing by Claypole and Beckingham, it proceeds through a wide sandy valley to Lincoln. It now flows almost directly east to Grubhill, where it turns to the south-east, and con-

tinues in this direction to Boston, and unites its waters with the sea, at a place called Boston Deep. From its source to Beckingham its banks are diversified with rising grounds and ornamental objects. Among the latter is the elegant spire of Grantham church, the fine woods at Belton park, Syston park, and Little Ponton. In its course to Lincoln, the contiguous country is diversified by high grounds, vallies, and woods: after passing the city, it leaves the high lands, and continues through a level tract of country to the sea. Much of the present bed of the river, from Boston upwards, is a new artificial cut made for the purpose of widening and straightening the channel, rendering it more commodious for navigation, and better adapted to receive and carry off the water of the contiguous fens. From Lincoln it becomes navigable to the sea, and has also a communication with the Trent, by means of a navigable canal, called Fosdyke, cut by king Henry I., which is still of material use in conveying away the corn, wool, and other commodities of the country.

WITHAM FRIARY, a parish of England, in Somersetshire; 5 miles south-south-west of Frome. Population 533.

WITHAMSHAW, a hamlet of England, in the parish of Bowden, Cheshire.

WITHCALL, a parish of England, in Lincolnshire; 3½ miles west-by-south of Lowth.

WITHCOTE, a parish of England, in Leicestershire; 9 miles south-south-east of Melton Mowbray.

WITHCOMBE RAWLEIGH, a parish of England, in Devonshire. Population 859.

To WITHDRAW, *v. a.* [from *wið*, or *wiðer*, Saxon, *against*, and *draw*.] To take back; to bereave.—It is not possible they should observe the one, who from the other *withdraw* unnecessarily obedience. *Hooker.*—To call away; to make to retire.—*Nausicca* is *withdrawn*, and a whole nation introduced, for a more general praise of Ulysses. *Broome.*

To WITHDRAW, *v. n.* To retire; to retreat.—She from her husband soft *withdrew*. *Milton.*

WITHDRAWER, *s.* One who bereaves.—He was not a *withdrawer* of the corn, but a seller. *Outred.*

WITHDRAWINGROOM, *s.* Room behind another room for retirement.—For an ordinary gentleman, a hall, a great parlour, with a *withdrawingroom*, with a kitchen, buteries, and other conveniences, is sufficient. *Mortimer.*

WITHE, *s.* [*wiðiz*, Sax., *salix*; *wide*, Sueth. id. *widia*, Sueth. *vimen*, *vinculum vimineum*. *Serenius.*] A willow twig.

There let him lie

Till I, of cut-up osiers, did imply
A *with*, a fathome long, with which his feete
I made together, in a sure league, meete. *Chapman.*

A band, properly a band of twigs. [*withan*, M. Goth., to *join*.] These cords and *withes* will hold men's consciences, when force attends and twists them. *King Charles.*

WITHELFLOREY, a hamlet of England, in Somersetshire; 4 miles from Dulverton.

To WITHER, *v. n.* [*zeriðerob*, Saxon, *dry*, *faded*.] To fade; to grow sapless; to dry up.

When I have pluck'd thy rose,
I cannot give it vital growth again;
It needs must *wither*. *Shakspeare.*

To waste, or pine away.—Are there so many left of your own family, that you should desire wholly to reduce it, by suffering the last branch of it to *wither* away before its time. *Temple.*—To lose or want animal moisture.

Vain men, how vanishing a bliss we crave,
Now warm in love, now *with'ring* in the grave. *Dryden.*

To WITHER, *v. a.* To make to fade.—The sun is no sooner risen with a burning heat, but it *withereth* the grass, and the flower thereof falleth. *Ja.*—To make to shrink, decay, or wrinkle, for want of animal moisture.—Age cannot *wither* her, nor custom stale her infinite variety. *Shakspeare.*

Look how I am bewitch'd; behold, mine arm
Is, like a blasted sapling, *withered up*. *Shakspeare.*

WITHERBAND, *s.* A piece of iron, which is laid under a saddle, about four fingers above the horse's *withers*, to keep the two pieces of wood tight, that form the bow. *Farrier's Dict.*

WITHEREDNESS, *s.* The state of being withered; marcidness.—The dead *witheredness* of good affections. *Bp. Hall.*—Water them as soon as set, till they have recovered their *witheredness*. *Mortimer.*

WITHERIDGE, a parish of England, in Devonshire. Population 913.

WITHERING (William), M. D. F. R. S., was born in 1741, and finished his medical education in the university of Edinburgh, where he took his degree of doctor in 1766. From Stafford, where he first settled and married, he removed to Birmingham, and speedily attained, by his skill and assiduity, to very extensive and profitable practice; without seeking much society, or neglecting his scientific pursuits in order to secure it. The chief objects of his attention, independently of his professional engagements, were botany and chemistry. The result of his scientific inquiries and labours appears in the following list of his valuable publications; viz. "A Botanical Arrangement of British Plants," in 2 vols. 8vo. 1776, which passed through two more editions, in 1787, 3 vols., and in 1796, 4 vols., with numerous improvements and additions, some of which were suggested by his friends, and particularly by Dr. Stokes. In chemistry and mineralogy, a translation of Bergman's "Sciagraphia Regni Mineralis," 1783, and the following papers in the Philosophical Transactions; "Experiments on different kinds of Marle found in Staffordshire," 1773; an "Analysis of the Toad-stone of Derbyshire," 1782; "Experiments on the Terra Ponderosa," 1784; and "Analysis of a Hot Mineral Spring in Portugal," 1798. In the improvement of his own profession, "Account of the Scarlet Fever and Sore Throat, particularly as it appeared at Birmingham in the year 1778;" and "An Account of the Fox-glove and some of its Medical Uses; with Practical Remarks on the Dropsy and other Diseases," 1785. Subject to pulmonic attacks, which weakened his lungs, he thought it necessary, in 1793 and 1794, to pass the winter in a warmer climate, and he fixed on Lisbon. Afterwards he became incapable of his former professional exertions, and died at the Larches, near Birmingham, in November, 1799, at the age of 58. In his intellectual character he joined unremitting application with sagacity and discernment. In his medical practice he limited prescription to that quantity and kind of medicine which was absolutely necessary for his patients; and if any in the inferior branches of the profession disliked this mode of practice, their disapprobation of it was a testimony in its favour. In his disposition he was mild and humane, and his natural reserve did not preclude him from the pleasure of rational society. His valuable library and handsome property were inherited by an only son.—*Gen. Biog.*

WITHERINGIA [so named by Mons. L'Heritier, in honour of William Withering, M. D. F. R. S., &c., author of an Arrangement of British Plants, &c.], in Botany, a genus of the class tetrandria, order monogynia, natural order of luridæ, solanææ (*Juss.*)—Generic Character. Calyx: perianth one-leaved, very short, indistinctly four-toothed, permanent. Corolla: one-petalled: tube subglobular; border four-parted; segments lanceolate, acute, recurved. Nectary four submarginate excavations in the tube of the corolla. Stamina: filaments four, erect, roundish, fastened below to the tube of the corolla, and villose. Anthers ovate, converging, opening at the sides. Pistil: germ superior, ovate. Style filiform, a little longer than the stamens. Stigma headed. Pericarp: berry two-celled. Seeds numerous, inserted into a two-parted receptacle.—*Essential Character.* Corolla subcampanulate, with four bumps in the tube. Calyx very small, indistinctly four-toothed. Pericarp two-celled.

Witheringia solanacea. Stem herbaceous, scarcely a foot high, round, but cornered with the decurrent sides of the petioles, of a dirty red colour, and somewhat villose. Leaves

alternate, in pairs, ovate-oblong, acute, quite entire, somewhat hairy, a hand in length. Petioles scarcely an inch long, scored above with two channels, red. Umbels many-flowered, axillary, sessile. Peduncles round, smooth, half an inch long. Corolla pale yellow; tube somewhat pitcher-shaped, bluntly four-cornered, with four protuberances, a line and half in diameter; segments of the border trilinear. Filaments whitish, smooth without, hirsute within.—Native of South America.

WITHERLEY, a hamlet of England, in Leicestershire. Population 334.

WITHERNE, a parish of England, in Lincolnshire; 3½ miles north-west of Alford.

WITHERNSEA, a township of England, East Riding of Yorkshire; 19 miles east-by-south of Kingston-upon-Hull.

WITHERNSWICK, a parish of England, East Riding of Yorkshire; 12½ miles east-by-north of Beverley.

WITHERS, *s.* Is the joining of the shoulder-bones at the bottom of the neck and mane, towards the upper part of the shoulder. *Farrier's Dict.*

Let the gall'd beast wince;
We are unwrung in the *withers*. *Shakspeare.*

WITHERSDALE, a parish of England, in Suffolk; 7 miles north-west of Halesworth.

WITHERSFIELD, a parish of England, in Suffolk; 9 miles west-by-north of Clare.

WITHERSLACK, a township of England, in Westmorland; 10 miles south-west of Kendal.

WITHERWRUNG. The hurt expressed by *witherwrung* sometimes is caused by a bite of a horse, or by a saddle being unfit, especially when the bows are too wide; for when they are so, they bruise the flesh against the spines of the second and third vertebræ of the back, which forms that prominence that rises above their shoulders. *Farrier's Dict.*

To **WITHHOLD**, *v. a.* [*Withheld* or *withholden*, pret. and part. Spenser has, for the sake of rhyme, very licentious written *withhaul*.]—To restrain; to keep from action; to hold back.

Sith mine he is, or free or bound;
Withhold, O sovereign prince, your hasty hand
From knitting league with him. *Spenser.*

The prince
Would fain have come with me to meet your grace;
And by his mother was perforce *withheld*. *Shakspeare.*

To hinder; to obstruct.—What difficulties there are, which as yet *withhold* our assent till we be further and better satisfied, I hope no indifferent amongst them will scorn or refuse to hear. *Hooker.*—To take away; to refuse.

Soon as Titan gan his head exault,
And soon again as he his light *withhaul*,
Their wicked engines they against it bent. *Spenser.*

WITHHOLDEN, *part. pass.* of *withhold*.—The word keep back, sheweth, that it was a thing formerly due unto God; for we cannot say that any thing is kept back, or *withholden*, that was not due before. *Spelman.*

WITHHOLDER, *s.* One who withholds.—The words are spoken against them that invade tithes and church rights; and that which is there threatened, happened to this *withholder*. *Stephens.*

WITHIAL, a hamlet of England, in the parish of Penard, Somersetshire.

WITHIEL, a parish of England, in Cornwall; 5 miles west-south-west of Bodmin.

WITHIN, *prep.* [wíðinnan, Sax.] In the inner part of;

Who then shall blame
His pester'd senses to recoil and start,
When all that is *within* him does condemn
Itself for being there? *Shakspeare.*

In the compass of; not beyond: used both of place and time.—Next day we saw, *within* a kenning before us, thick clouds, which put us in hope of land. *Bacon.*—Not reaching to any thing external.—Were every action concluded *within* itself,

itself, and drew no consequences after it, we should undoubtedly never err in our choice of good. *Locke*.—No longer ago than.

Within these five hours Hastings liv'd,
Untainted, unexamined, free at liberty.

Shakspeare.

Within these three hours, Tullus,
Alone I fought in your Corioli walls,
And made what work I pleas'd.

Shakspeare.

Into the reach of.

When on the brink the foaming boar I met,
The desperate savage rush'd *within* my force,
And bore me headlong with him down the rock. *Otway.*

In the reach of.

Secure of outward force, within himself
The danger lies, yet lies *within* his power;
Against his will, he can receive no harm. *Milton.*

Into the heart or confidence of.—When by such insinuations they have once got *within* him, and are able to drive him on from one lewdness to another, no wonder if they rejoice to see him guilty of all villainy. *South*.—Not exceeding.—Be informed how much your husband's revenue amounts to, and be so good a computer as to keep *within* it. *Swift*.—In the inclosure of.

No interwoven reeds a garland made,
To hide his brows *within* the vulgar shade;
But poplar wreaths around his temples spread. *Addison.*

WITHIN, *adv.* In the inner parts; inwardly; internally.

Death thou hast seen

In his first shape on man; but many shapes
Of death, and many are the ways that lead
To his grim cave: all dismal, yet to sense
More terrible at the entrance, than *within*. *Milton.*

In the mind.—Language seems too low a thing to express your excellence, and our souls are speaking so much *within*, that they despise all foreign conversation. *Dryden.*

WITHING, a hamlet of England, in the parish of Aylesbeare, Devonshire.

WITHINGTON, a parish of England, in Gloucestershire; 6 miles west-north-west of North Leach. Population 650.—2. A parish in Herefordshire; 4 miles east-north-east of Hereford. Population 561.—3. A township in Lancashire; 4 miles south of Manchester. Population 911.—4. A parish in Salop; 6 miles east of Shrewsbury.

WITHINGTON, LOWER, a township of England, in Cheshire; 7 miles north-north-west of Congleton.

WITHINGTON, UPPER or *OLD*, another township in the above county, half a mile distant from the foregoing.

WITHINSIDE, *adv.* In the interior parts.—The forceps for extracting the stone is represented a little open, that the teeth may be better seen *withinside*. *Sharp.*

WITHNELL, a township of England, in Lancashire; 5 miles north-east of Chorley. Population 1049.

WITHOEC, a town of Western Africa, in the county of Cape Lopez Gonsalvo; 30 miles north of Olibato.

WITHOUT, *prep.* [*piðutan*, Sax.] Not with.—Many there are, whose destinies have prevented their desires, and made their good motives the wards of their executors, not *without* miserable success. *Bp. Hall*.—In a state of absence from.

Hast so much wit, and mirth, and spleen about thee,
There is no living with thee, nor *without* thee. *Tatler.*

In the state of not having.—If the ideas be not innate, there was a time, when the mind was *without* those principles; and then they will not be innate, but be derived from some other original. *Locke*.—Beyond; not within the compass of.—Eternity, before the world and after, is *without* our reach; but that little spot of ground that lies betwixt those two great oceans, this we are to cultivate. *Burnet*.—Supposing the negation, or omission of.—*Without* the separation of the two monarchies, the most advantageous terms from the French, must end in our destruction. *Addison*.—Not by; not by the

use of; not by the help of.—Excess of diet in costly meats and drinks, fetched from beyond the seas, should be avoided; wise men will do it *without* a law; I would there might be a law to restrain fools.—*Bacon*.—On the outside of.

Without the gate

Some drive the cars, and some the coursers rein. *Dryden.*

Not *within*.—When the weather hinders me from taking my diversions *without* doors, I frequently make a little party with select friends. *Addison*.—With exemption from.—The great lords of Ireland informed the king, that the Irishry might not be naturalized *without* damage to themselves or the crown. *Davies.*

WITHOUT, *adv.* Not on the inside.—These were from *without* the growing miseries. *Milton*.—Out of doors.

Their doors are barr'd against a bitter flout;
Snarl, if you please, but you shall snarl *without*. *Dryden.*

Externally; not in the mind.

WITHOUT, *conjunct.* Unless; if not; except.—*Not in use, except in conversation*.—I find my love shall be proved no love, *without* I leave to love, being too unfit a vessel in whom so high thoughts should be engraved. *Sidney.*

WITHOUTEN, *prep.* [*piðutan*, Saxon.] *Without*. *Obsolete.*

Her face so fair, as flesh it seemed not,
But heavenly pourtrait of bright angel's hue,
Clear as the sky, *withouten* blame or blot,
Through goodly mixture of complexion's dew. *Spenser.*

To *WITHSTAND*, *v. a.* To gainstand; to oppose; to resist.

They soon set sail; nor now the fates *withstand*;
Their forces trusted with a foreign hand. *Dryden.*

WITHSTANDER, *s.* An opponent; resisting power.—War may be defined the exercise of violence under sovereign command against *withstanders*; force, authority, and resistance being the essential parts thereof. *Ralegh.*

WITHWIND, *s.* [*convolvulus*, Latin.] An herb.

WITHY, *s.* [*piðiz*, Saxon. See *WITHE*.] A willow-tree. In some parts of the north, a *withy* is a round hoop of osier. *Grose*. In Scotland, *widdy*, a halter made of withies. *G. Chalmers*. And so old Eng. See *SMIDDY*.—The *withy* is a reasonable large tree, for some have been found ten feet about. *Evelyn.*

WITHY, *adj.* Made of withes.

I learnt to fold my net,
And *withy* labyrinths in straits to set. *P. Fletcher.*

WITHYBRIDGE, a hamlet of England, in Gloucestershire; 5 miles from Cheltenham.

WITHYBROOKE, a parish of England, in Warwickshire; 8 miles north-east of Coventry.

WITHYCOMBE, a parish of England, in Somersetshire; 2½ miles south-east of Dunster.

WITHYHAM, a parish of England, in Sussex; 6½ miles east-south-east of East Grinstead.

WITHYPOOLE, a hamlet of England, in Salop, near Tenbury.—2. A hamlet in Somersetshire; 7 miles north-west of Dulverton.

WITKOW, a small town of Austrian Poland, in the circle of Zloczow.

WITKOWO, a small town of Prussian Poland; 35 miles east of Posen. Population 1700.

WITLESS, *adj.* Wanting understanding; inconsiderate; wanting thought.

I have ever lov'd the life remov'd;
And held in idle price to haunt assemblies,
Where youth, and cost, and *witless* bravery keeps. *Shakspeare.*

WITLESSLY, *adv.* Inconsiderately; without understanding.

I have transgress'd all goodness, *witlessly*
Rais'd mine own curses from posterity;
I'll follow, to redress in what I may. *Beaum. and Fl.*

WITLESSNESS,

WITLESSNESS, *s.* Want of consideration.—Where wilful *witlessness* doth not bar against it. *Sir E. Sandys.*

WITLEY, a village and parish of England, in the county of Surrey. It still retains its privilege of an ancient demesne of exemption from juries; $3\frac{1}{2}$ miles south-west of Godalming. Population 1187.

WITLEY, a hamlet of England, in Worcestershire; 8 miles from Worcester.

WITLEY, GREAT, a parish of England, in Worcestershire; 10 miles north-west of Worcester. Population 414.

WITLING, a pretender to wit; a man of petty smartness.—You have taken off the senseless ridicule, which for many years the *witlings* of the town have turned upon their fathers and mothers. *Addison.*

WITLINGHAM, a parish of England, in Norfolk; 3 miles east-south-east of Norwich.

WITNESHAM, a parish of England, in Suffolk; $4\frac{1}{2}$ miles north-by-east of Ipswich.

WITNESS, *s.* [wɪtnɛs, Saxon.] Testimony; attestation.

The devil can cite scripture for his purpose;
An evil soul producing holy *witness*,
Is like a villain with a smiling cheek;
A goodly apple rotten at the heart.

Shakespeare.

One who gives testimony.

The king's attorney
Urg'd on examinations, proofs, confessions
Of divers *witnesses*.

Shakespeare.

Nor need I speak my deeds, for these you see;
The sun and day are *witnesses* for me.

Dryden.

With a WITNESS. Effectually; to a great degree, so as to leave some lasting mark or testimony behind. *A low phrase.*

Now gall is bitter *with a witness*;
And love is all delight and sweetness.

Prior.

To WITNESS, v. a. To attest; to tell with asseveration.

There ran a rumour
Of many worthy fellows that were out,
Which was to my belief *witness'd* the rather,
For that I saw the tyrant's pow'r a-foot.

Shakespeare.

To WITNESS, v. n. To bear testimony.
Witness you ever-burning lights above!
You elements that clip us round about!
Witness that here Iago now doth give
The execution of his wit, hands and heart,
To Othello's service.

Shakespeare.

WITNESS, interj. An exclamation signifying that person or thing may attest it.

For want of words, or lack of breath,
Witness, when I was worried with thy peels.

Milton.

WITNESSER, *s.* One who gives testimony.—He was now so well become a constant *witnesser* of the passion of Christ, that, by crucifying the desires of his flesh, he gave an example of an heavenly conversation unto all his subjects. *Martin.*

WITNEY, a market town of England, in the county of Oxford; is situated on the river Windrush, and consists chiefly of two streets. This place has been long celebrated for its manufactory of blankets, which flourished extremely during the last war, in consequence of the great demands of government to supply the various armaments engaged in foreign service. This trade has of course declined since the conclusion of peace. In the reign of queen Anne, the blanket weavers were incorporated, under the style of the master assistants, wardens, and commonalty of the blanket weavers of Witney. They have also their hall, in which they regulate all matters respecting the measure, mark, and quality of their staple commodity. This hall is situated on the east side of the High-street, and is a handsome edifice. About the centre of the same street is the town-hall, a handsome

modern building of stone, with a piazza beneath, intended for a market-place. Nearly adjoining is a more humble building, termed the market-cross, which was erected by William Blake, Esq. of Coggs, in the year 1683, and was repaired, by a subscription among the town's people, in 1811. A free school was founded here by Mr. Henry Box, in 1660. The building is respectable, and consists of a dwelling for the master, and a spacious school room, with an annexed library. A charity school was likewise founded here in the year 1732. The boys receive education, clothing, and five pounds as an apprentice fee. Witney church is a large and handsome building, of the cruciform description. From the square tower in the centre rises a spire, of substantial, rather than light proportions. At each angle of the tower is an octangular turret; and four faces of the steeple are ornamented with a pointed piece of masonry, divided by mullions of stone, into four compartments. The north entrance is by a descent of several steps, through a round-headed doorway; over which is a vacant canopied niche; and many niches of a similar description occur in various divisions of the northern side. Small grotesque figures are placed on several of the lower portions of the structure. The church contains the burial-places of several ancient families. There are meeting-houses for Quakers, Presbyterians, and Methodists. The market day is Thursday, and its fairs are, Easter Thursday, Holy Thursday, 10th July, Thursday before 10th October, Thursday after September 8th, and the 4th December; $11\frac{1}{2}$ miles west-north-west of Oxford, and 66 west-north-west of London. Population in 1821, 2722.

WITSENIA [Nicholas Witsen, author of Descriptions of Shells, found in the East Indies], in Botany, a genus of the class triandria, order monogynia, natural order of ensatæ, irides (*Juss.*)—Generic Character. Calyx none. Corolla: one-petalled, tubular; tube cylindrical, widening gradually; border six-parted, from upright spreading; segments oblong, obtuse. Stamina: filaments three, inserted into the tube above, short. Anthers oblong, upright. Pistil: germ superior. Style filiform, upright, but drooping at the tip, longer than the corolla. Stigma emarginate.—*Essential Character.* Corolla one-petalled, cylindrical, six parted. Stigma emarginate. Capsule superior.

Witsenia maura.—Stem two feet high, ancipital, covered with sheaths of leaves. Leaves ensiform, alternate, approximating, striated, narrow, the upper ones longer than the stem, with imbricate sheaths. Spike composed of alternate, imbricate spikelets. Spathelets loose, scariose, subbiflorous, lanceolate. Corolla funnel-form, of the same figure with *Gladiolus Meriana.*—Native of the Cape of Good Hope.

WITSHED, POINT, a cape on the west coast of North America, in Prince William Sound. Lat. 60. 29 $\frac{1}{2}$. N. long. 214. 29. E.

WITSNA'PPER, s. One who affects repartee.

Go in, sirrah; bid them prepare for dinner.—

—That is done, sir; they have all stomachs.—

—What a *witsnapper* are you!

Shakespeare.

WITSON, a village of England, in Monmouthshire, near Newport.

WITT (John de), the son of a burgomaster of Dordrecht, was born in 1625, and educated in various useful sciences, so as to excel in a knowledge of jurisprudence, politics, and mathematics, in the latter of which he was so great a proficient, that he wrote a treatise on the elements of curve-lines, which was published under the inspection of Francis Schooten. For further improvement he spent some years in travel, and upon his return was elected to his father's post of pensionary of Dordrecht. Attached by his descent to the principles of republicanism, and jealous of the house of Orange, he opposed the elevation of this house, and dissuaded the province of Zealand from conferring the office of captain-general upon the young prince, William III. His conduct in this business was much approved, and he was henceforth regarded as at the head of the political administration of the United Provinces. This was a period peculiarly critical and interesting. The war with the new English republic distressed the states;

it was injurious to their trade and finances; and presented to the Orange party a favourable opportunity for advancing prince William to the power and dignities possessed by his ancestors. Peace at length became absolutely necessary; and one of the articles concluded upon in 1654, and dictated by Cromwell, was the perpetual exclusion of the prince of Orange from the high offices formerly held by his family. This article was agreed to by the states of Holland alone, and when De Witt drew up a declaration for divulging it, some of the provinces censured it, and charged the anti-Orange party with having suggested it to Cromwell. The province of Holland, however, carried the point, and the general tranquillity was little disturbed. De Witt now directed his attention to the state of the finances, and succeeded in reducing the interest of the public debt, and persuading the people to acquiesce in this measure. The restoration of Charles II. was generally agreeable to the United States, and more especially to the Orange party: but the restored sovereign soon declared his dissatisfaction with De Witt, because he had been hostile to the elevation of the house of Orange. From this time, the Dutch statesman favoured the politics of France more than those of England. At length a war took place between the Dutch and English in 1665; during the progress of which De Witt was often unpopular, though he was the main spring which kept in action the resources of the state, and remedied every calamity. Peace with England in 1667, developed the ambitious projects of Lewis XIV. in taking possession of the Spanish Netherlands; and the alarm which this measure produced in the United Provinces gave occasion to the friends of the house of Orange, to propose the elevation of the young prince to the dignities which his family had possessed. De Witt, with a view of counteracting this purpose, obtained a resolution on the part of the states of Holland for separating the offices of captain-general and stadtholder, which resolution gave great offence to the other provinces, and rendered De Witt, with whom it was supposed to have originated, extremely unpopular. Sensible, however, of the dangers arising from French ambition, he concurred in the triple alliance between England, Sweden, and the United Provinces, concluded, in 1668, by himself and sir William Temple.

The character of De Witt has been described in honourable terms by sir William Temple, who knew him well, both in private life and in his public station. He speaks of him as a person of indefatigable application, of invincible resolution, of a sound and clear judgment, and of irreproachable integrity, insomuch, that if he was blinded in any respect, it was in consequence of his passion for promoting what he thought the welfare of his country. He bears testimony to the pensionary's knowledge of the interests of foreign courts, though he did not make sufficient allowance for the treachery of princes, or rather their ministers, and was thus misled with regard to the ambitious views of France. If he had any wrong bias in his political conduct, it was that of an hereditary jealousy and dislike of the house of Orange, which led him in some cases to act rather as a party leader than an unprejudiced patriot. No man could be less influenced than De Witt by views of avarice or ostentation. His manners and appearance were adapted to the ancient simplicity and frugality of his country, even in the height of his power. When his papers and private letters were submitted to a rigorous scrutiny after his death, nothing was discovered that could impeach his integrity. When one of the commissioners was asked what they had found in De Witt's papers; "What (said he) could we have found—nothing but probity!" As a man of business, he was scrupulously attentive to order and method; and when he was once asked, How he was able to transact such a multiplicity of affairs? he replied, "By doing only one thing at a time."

—*Mod. Un. Hist. Gen. Biog.*

WITTED, *adj.* Having wit: as, a quick *witted* boy.

WITTENBERG, a city of Prussian Saxony, in the government of Merseburg, on the Elbe. It is situated on a level and sandy spot, which, particularly since the shady walks around the town were cut down by the French, for

the purpose of defence, in the campaign of 1813, presents little variety or interest. The town is of an oblong form, consisting of one street, with suburbs widely spread, but defended by a dyke from the inundations of the Elbe. Its works, formerly considerable, were allowed to fall gradually to decay, until reinstated by the French in 1813. It has some linen manufactories. Wittenberg is a place of some antiquity, having been, in the 15th and 16th centuries, the capital of the electoral circle of Saxony. Its university, founded in 1502, is memorable as the cradle of the reformation, Luther having been appointed professor of philosophy in 1508; and having here, from his academical chair, exposed the corruptions of the Catholic church. He, and his milder associate Melancthon, are buried in the university church; and their tombs are pointed out by simple inscriptions. But so lately as October, 1821, a monumental colossal statue of Luther was erected in Wittenberg, with great solemnity. After Wittenberg ceased to be the residence of a court, it was found inadequate to the support of a university. The latter was annexed to that of Halle, and its place supplied by a gymnasium, or classical school. Since 1815, this town has been ceded to Prussia. It suffered considerably from the calamities of war, particularly in the contest of 1756; and in a comparatively recent attack by the Russians in January, 1814; 69 miles north-north-west of Dresden, and 40 north-north-east of Leipsic. Population 5000.

WITTENBERGE, a town of Prussia, on the Old Elbe, with 900 inhabitants; 72 miles north-west of Berlin.

WITTENBURG, a town of Germany, with 1400 inhabitants; 17 miles west of Schwerin.

WITTENHALL, or WILLENHALL, a township of England, in Staffordshire. Population 3523.

WITTENHAM, LITTLE, a parish of England, in Berkshire, near Wallingford.

WITTENHAM, LONG or WEST, another parish in the above county; 1 mile distant from the foregoing. Population 404.

WITTERING, a parish of England, in Northamptonshire, near Wandsford.

WITTERING, EAST, a parish of England, in Sussex; 6½ miles south-west of Chichester.

WITTERING, WEST, another parish in the above county; 1 mile distant from the foregoing. Population 483.

WITTERSHAM, a parish of England, in Kent. Population 754.

WITTERSHEIM, a small town of Prussian Westphalia; miles from Minden.

WITTICH, a small town of the Prussian province of the Lower Rhine; 22 miles north-north-east of Treves. Population 1600.

WITTICHENAU, or KULOW, a town of Upper Lusatia, on the Black Elster; 32 miles north-east of Dresden. Population 1500.

WITTICHENDORF, a village of Saxony, in Upper Lusatia. Population 900.

WITTICISM, *s.* A mean attempt at wit. This word Dryden innovated. "A mighty *witticism*, pardon a new word." *Dryden*.—We have a libertine fooling even in his last agonies, with a *witticism* between his teeth, without any regard to sobriety and conscience. *L'Estrange*.—He is full of conceptions, points of epigram and *witticisms*, all which are below the dignity of heroic verse. *Addison*.

WITTILY, *adv.* Ingeniously; cunningly; artfully. But is there any other beast that lives,
Who his own harm so *wittily* contrives? *Dryden*.

With flight of imagination.—In conversation *wittily* pleasant, pleasantly gamesome. *Sidney*.

WITTINESS, *s.* The quality of being witty.—No less deserveth his *wittiness* in devising, his pithiness in uttering, his pastoral rudeness and his moral wisdom. *Spenser*.

WITTINGAU, or TRZEBON, a town of Bohemia; 74 miles south-by-east of Prague, and 13 east of Budweis. Population 2800.

WITTINGEN,

WITTINGEN, a town of Hanover; 33 miles east of Zell. Population 900.

WITTINGHAM, a parish of Scotland, in Haddingtonshire, about 11 miles long and 4 broad, and lying among the Lammermuir hills. Population 616.

WITTINGLY, *adv.* [*wītan*, Saxon, *to weet or know.*] Knowingly; not ignorantly; with knowledge; by design.

Withhold revenge, 'tis not my fault,
Nor wittingly have I infring'd my vow. *Shakspeare.*

WITTINGTON, a parish of England, in Derbyshire; 2 miles north of Chesterfield. Population 627.—2. A parish in Gloucestershire; 4½ miles east-south-east of Cheltenham.—3. A parish in Lancashire; 16 miles north-east of Lancaster.—4. A parish in Salop; 3 miles east-north-east of Oswestry. Population 1460.—5. A township in Staffordshire; 4 miles north-west of Tamworth. Population 602.—6. A township in Warwickshire; 2 miles north-west of Atherstone.

WITTINGTON, or WELLINGTON, a township of England, in Northumberland: 5 miles from Newcastle. Population 1278.—2. A hamlet of England, in Norfolk.

WITTLE HILL, in Lancashire, England, 1614 feet above the sea.

WITTMUND, a town of Hanover; 27 miles north-east of Embden. Population 1600.

WITTOL, *s.* [*wīttol*, Sax. from *wītan*, *to know.*] A man who knows the falsehood of his wife, and seems contented; a tame cuckold.—Amaimon sounds well; Lucifer well; yet they are the names of fiends: but cuckold, *wittol-cuckold*, the devil himself hath not such a name. *Shakspeare.*

WITTOLLY, *adj.* Cuckoldly.—The jealous *wittolly* knave hath masses of money. *Shakspeare.*

WITTON, a township of England, in Cheshire, adjacent to Northwich. Population 1966.—2. A parish in Huntingdonshire; 2½ miles north-by-west of St. Ives.—3. A township in Lancashire; 2 miles west-by-north of Blackburn. Population 819.—4. A parish in Norfolk; 5½ miles east of Norwich.—5. Another parish in Norfolk; 3½ miles east-by-north of North Walsham.

WITTON, EAST, a township of England, North Riding of Yorkshire, near Middleham. Population 695.

WITTON GILBERT, a parish of England, county of Durham; 3 miles north-west of Durham. Population 399.

WITTON-LE-WEAR, a township of England, county of Durham; 5 miles west-north-west of Bishop's Auckland.

WITTON, LONG, a township of England, in Northumberland; 9½ miles from Morpeth.

WITTON, NETHER, a township in the above county, near the foregoing.

WITTON, SHEALES, a township in the same county; 7 miles from Morpeth.

WITTON, UPPER, a hamlet of England, in Warwickshire, near Birmingham.

WITTON, WEST, a parish of England, North Riding of Yorkshire; 5 miles west of Middleham. Population 439.

WITSTOCK, a town of Prussia, in the province of Brandenburg, on the river Dosse; 56 miles north-west of Berlin. It has considerable woollen manufactures. Population 3800.

WITTY, *adj.* Judicious; ingenious; inventive.

The deep revolving, *witty* Buckingham,
No more shall be the neighbour to my counsels. *Shakspeare.*

Thou art beautiful in thy countenance, and *witty* in thy words. *Judith.*—Full of imagination.

In gentle verse the *witty* told their flame,
And grac'd their choicest songs with Emma's name. *Prior.*

Sarcastic; full of taunts.—Honeycomb, who was so unmercifully *witty* upon the women, has given the ladies ample satisfaction by marrying a farmer's daughter. *Addison.*

WITWAL, *s.* [*wīreo*, Lat.] A bird. *Ainsworth.*

WITWORM, *s.* One that feeds upon wit; a canker of wit.—Thus to come forth so suddenly a *witworm*. *B. Jonson.*

WITZELSDORF, a market town of Germany, in Lower Austria, near the Danube.

WITZENHAUSEN, a small town of Germany, in Hesse-Cassel; 15 miles east of Cassel. In a fire in 1809, above 200 of the houses were burned down. Population 2300.

To WIVE, *v. n.* To marry; to take a wife.

Were she as rough
As are the swelling Adriatick seas,
I come to *wive* it wealthily in Padua. *Shakspeare.*

The ancient saying is no heresy,
Hanging and *wiving* goes by destiny. *Shakspeare.*

To WIVE, *v. a.* To match to a wife.

She dying gave it me;
And bid me, when my fate would have me *wiv'd*,
To give it her. *Shakspeare.*

To take for a wife.—If he have the condition of a saint, and the complexion of a devil, I had rather he should shrive me than *wive* me. *Shakspeare.*

WIVEHOOD, *s.* Behaviour becoming a wife.

That girdle gave the virtue of chaste love,
And *wivehood* true, to all that did it bear. *Spenser.*

WIVELESS, *adj.* Without a wife; unmarried.—They in their *wiveless* state run into open abominations. *Homily of Matrimony.*

WIVELISCOMBE, a market town of England, in the county of Somerset, is situated in a valley encompassed by lofty hills, which are adorned with beautiful woods. On an eminence, about a mile from the town, are the remains of an encampment, still called the castle. In the year 1711 numerous Roman coins were found here. About the year 1256, an episcopal palace was built here, which is now in ruins, and part of the ancient site has been built upon. Besides the church, there are dissenting meeting-houses. Here is an alms-house, or hospital, for twelve poor people. Wiveliscombe had an extensive trade in shrouds, blanketings, kerseys, and baize; but within the last 10 or 15 years, its trade has suffered greatly. The parish includes four small hamlets besides the town, and consists of 567 houses, and 2250 inhabitants. The town consists of seven irregular streets. Its government is vested in a bailiff and portreeve, who are annually chosen in May. A weekly market is held on Saturday; and here are three annual fairs; 11 miles west of Taunton, and 156 west-by-south of London.

WIVELSFIELD, a parish of England, in Sussex; 4 miles south-east of Cuckfield.

WIVELY, *adv.* [It were written more analogically *wifely*, that is, *wife-like.*] Belonging to a wife.—Basilicus could not abstain from praising Parthenia, as the perfect picture of a womanly virtue, and *wively* faithfulness. *Sidney.*

WIVENHOE, a village and parish of England, in the county of Essex. It is situated on the river Colne; 3½ miles south-east of Colchester, of which it is the port. Population 1046.

WIVER, or WIVERN, *s.* A kind of heraldic dragon.—The erle of Kent beareth a *wiver* for his creste and supporters. *Thynne.*

WIVERBY, a parish of England, in Leicestershire, near Melton Mowbray.

WIVES, *s.* The plural of wife.—A man of his learning should not so lightly have been carried away with old *wives* tales, from approbance of his own reason. *Spenser.*

WIVETON, a parish of England, in Norfolk, adjacent to Clay.

WIX, a parish of England, in Essex; 4 miles from Manningtree. Population 675.

WIXALL, a hamlet of England, in Salop, near Whitchurch.

WIXFORD, or WICCESFORD, a hamlet of England, in Warwickshire, near Alcester.

WIZARD,

WIZARD, *s.* [from *wise*: and therefore should be written *wisard*.] A wise person; a learned person.

Upon the eastern road
The star-led *wizards* haste with odours sweet. *Milton.*

A conjurer; a magician; an enchanter.
He hearkens after prophecies and dreams,
And from the cross-row plucks the letter G;
And says, a *wizard* told him that by G;
His issue disinherited should be. *Shakspeare.*

WIZARD, *adj.* Enchanting; charming; overpowering.—At which the *wizard* passions fly. *Collins.*—Haunted by wisards.—Where *Deva* spreads her *wisard* stream. *Milton.*

WIZE, a river of England, in Cumberland, which runs into the *Waver* at *Holme*.

To **WIZEN**, *v. n.* [*piſnian*, *Sax.* *arescere*.] To wither; to become dry: *wizened*, dried, withered, shrunk. Common in several parts of the north of England.

WIZNA, a town of Poland, on the river *Narew*; 88 miles north-east of *Warsaw*. Population 1100.

WLASCHIN, a town of Bohemia; 32 miles south-south-east of *Prague*. Population 1100.

WLODOWICE, a town of Poland; 37 miles north-north-west of *Cracow*. Population 900.

WO, or **WÖE**, *s.* [*pa*, *Saxon*; *wai*, *M. Goth.* *wai*, *Gr.*] *Woe* is the prevailing orthography, and probably will continue to be so.—Grief; sorrow; misery; calamity.

The king is mad: how stiff is my vile sense,
That I stand up and have ingenious feeling
Of my huge sorrows! better I were distract;
So should my thoughts be sever'd from my griefs;
And *woes* by wrong imaginations, lose
The knowledge of themselves. *Shakspeare.*

It is often used in denunciations, *wo be*; or in exclamations of sorrow, *wo is*; anciently *wo wurth*; *pa* *pupſ*, *Saxon*.

Wo is my heart;
That poor soldier, that so richly fought,
Whose rags sham'd gilded arms; whose naked breast
Stept before shields of proof, cannot be found. *Shakspeare.*

A denunciation of calamity; a curse.—Can there be a *wo* or curse in all the stores of vengeance equal to the malignity of such a practice; of which one single instance could involve all mankind in one confusion? *South.*—This is a mistake: as an adjective, *woe* is pure *Saxon*, *pa*, *mœstus*. And our old authors so use it.—He wexed wonderous *woe*. *Spenser.*

Woe are we, sir! you may not live to wear
All your true followers out. *Shakspeare,*

WOAD, *s.* [*paß*, *Saxon*; *glastum*, *Lat.*] A plant cultivated for the dyers, who use it for the foundation of many colours. *Miller.*

In times of old, when British nymphs were known
To love no foreign fashions like their own;
When dress was monstrous, and fig-leaves the mode,
And quality put on no paint but *woad*. *Garth.*

WOAHOO, or **OAHOÖ**, one of the *Sandwich* islands. As far as could be judged from the appearance of the north-east and north-west parts, it is much the finest island of the whole group. Nothing can exceed the verdure of the hills, the variety of wood and lawn, and rich cultivated vallies, which the whole face of the country displayed. The road is formed by the north and west extremities. Should the ground-tackling of a ship be weak, and the wind blow strong from the north, to which quarter the road is entirely open, this circumstance might be attended with some danger; but with good cables there would be little risk, as the ground from the anchoring place, which is opposite to the valley through which the river runs to the north point, is a fine sand. This island is supposed to contain 60,000 inhabitants. Long. of the anchoring place 202. 9. E. lat. 21. 43. N.

WO'BEGONE, *adj.* [*wo* and *begone*.] Lost in *wo*; distracted in *wo*; overwhelmed with sorrow.

Such a man,
So dull, so dead in look, so *wobegone*,
Vol. XXIV. No. 1666.

Drew *Priam's* curtain in the dead of night,
And would have told him half his *Troy* was burn'd;
But *Priam* found the fire, ere he his tongue. *Shakspeare.*

WOBURN, a market town of England, situated on the western side of the county of *Bedford*, bordering on *Buckinghamshire*, and on the great *London* road to the north. On the 19th of *June*, 1724, great part of it was destroyed by fire; but this unfortunate circumstance, though distressing to individuals, proved beneficial to the town, as many houses were soon afterwards rebuilt in a more convenient and handsome manner, with the addition of some good inns, and a market-house. The whole expense of the new buildings was defrayed by the benevolent nobleman who then enjoyed the estates and revenues which *Henry VIII.* had bestowed on the family of *Russel*. The market house was finished in the year 1737; but has been materially altered and improved by *Francis* duke of *Bedford*. It consists of two floors; the lower one is fitted up for butchers' shambles; over which is a large room, intended for the corn-market. The church was erected by *Robert Hobbs*, the last abbot of *Woburn*. It then belonged to the abbey, and is still of exempt jurisdiction, being in the exclusive possession of the duke of *Bedford*. This structure furnishes a whimsical instance of capricious taste; the body being completely detached from the tower, which stands at about six yards distance. The tower is a small square building, with large buttresses at the corners, and four pinnacles. The top is embrasured; the dial is about nine feet only from the ground. The church consists of three aisles and a chancel; the latter was embellished in a handsome manner by the late duke of *Bedford*. On the north side of this building is a curious marble monument for *sir Francis Stanton* and family. It consists of two compartments, comprising 12 figures kneeling in devotional attitudes. The pulpit, probably coeval with the abbey, is particularly deserving of notice, being richly ornamented with niches, pillars, and a variety of tracery. The munificence of the *Russels* has been of singular benefit to this town, where many monuments of their liberality are existing. *Francis*, the first earl of that name, founded and endowed a free-school; and a charity-school, for 30 boys and 15 girls, was afterwards erected by some other noble personage of the same family. These institutions are now consolidated. Here are likewise 12 alms-houses for as many poor families, built by *John*, duke of *Bedford*, in consequence of an act of parliament passed in the year 1762. By this act, 15 houses, cottages, tenements, &c., which had been vested for the benefit of the poor, and produced an annual income of about 24*l.*, were given to the duke for the sole use of him and his heirs, on condition that he or they should erect, and keep in repair, 12 houses, for the residence of the same number of indigent families; to whom also the sum of 30*l.* annually is to be distributed in half-yearly payments. *Birchmore*-house, and the surrounding lands, were made responsible for the due execution of this contract. The chief business of the poor is straw-hat and lace-making. About a mile from the town is *Woburn Abbey*, the splendid seat of the duke of *Bedford*. The house, a large edifice, is seated in a spacious park, adorned with fine old woods, and a large lake of water.

WOBURN, a post township of the United States, in *Middlesex* county, *Massachusetts*; 10 miles north of *Boston*. Population 1219.

WOBURN BISHOP'S, a parish of England, in *Buckinghamshire*; 3 miles west-south-west of *Beaconsfield*. Population 1604.

WOCHÉIN, a lake of *Austrian Illyria*, in the duchy of *Carniola*, situated in a valley of the same name.

WODE, *adj.* *Mad*. See **WOOD**.

WODESHÖLM, a small island in the gulf of *Finland*, on the coast of *Esthonia*.

WODNIAN, or **WODNANY**, a town of Bohemia, on the river *Blanitz*, with 1000 inhabitants; 64 miles south of *Prague*. Lat. 49. 10. N. long. 14. 2. E.

WODZYSŁAW, a town of Poland; 34 miles north-by-east of *Cracow*. Population 1100.

WOE. See *Wo*.

WOE, *worth the*. See *To WORTH*.

WOERAMATTA, a small island in the Eastern seas. Lat. 7. 2. S. long. 131. 36. E.

WOERDEN, a small town of the Netherlands, in the province of Utrecht, situated on the Old Rhine. It is fortified; 15 miles south of Amsterdam. Population 2700.

WO'FUL, *adj.* Sorrowful; afflicted; mourning.—The *woful* Gynecia, to whom rest was no ease, had left her lothed lodging, and gotten herself into the solitary places those desarts were full of. *Sidney*.—O *woful* day! O day of woe! *Philips*.—Wretched; paltry; sorry.

What *woful* stuff this madrigal would be,
In some starv'd hackney-sonneteer, or me?
But let a lord once own the happy lines,
How the wit brightens! how the style refines!

Pope.

WO'FULLY, *adv.* Sorrowfully; mournfully.—Wretchedly: in a sense of contempt.—He who would pass such a judgement upon his condition, as shall be confirmed at that great tribunal, from which there lies no appeal, will find himself *wofully* deceived, if he judges of his spiritual estate by any of these measures. *South*.

WO'FULNESS, *s.* Misery; calamity.—I would you to be void of care and *wofulness*. *Martin*.

WOGGORA, a small high province on the eastern coast of the lake of Dembea. It is all sown with wheat, and forms one of the granaries of Abyssinia.

WOHLAU, a principality of Prussian Silesia, to the north of that of Breslau, containing about 630 square miles, with 50,000 inhabitants.

WOHLAU, a town of Prussian Silesia, and the chief place of the above principality; 23 miles north-west of Breslau. Population 1300.

WOHYN, a small town of Poland, in the palatinate of Podlachia; 33 miles south-south-east of Siedlec.

WOKEFIELD, a hamlet in the parish of Sulhampstead, Berkshire.

WOKEY, or OKEY, a village and parish of England, in Somersetshire, within two miles of Wells, containing 859 inhabitants. On the north side of the village, in the lower part of the Mendip hills, is a remarkable dark cavern, called Wokey Hole, about 200 yards in length.

WOKING, a parish of England, in Surrey, on the Wey; 2½ miles west by-north of Ripley.

WOKINGHAM, or OAKINGHAM, a town of England, in the county of Berks, within the precincts of Windsor Forest. It consists of three streets, which centre in a spacious area, where the market-house is situated. This is an ancient building, framed with timber, and open at the bottom, with a hall above, wherein the public business is transacted. The church is a large, handsome edifice, with 3 aisles, supported within by handsome pillars, and containing several monuments. Wokingham has a good free school, and a charity school; and about one mile from the town, on Luckley Green, is an hospital, founded in 1663, for a chaplain or master, and as many poor men as the funds will support, under the direction of the draper's company of London. Archbishop Laud gave an estate, the rent of which, amounting to about 40% a year, is paid every third year to three servant girls, aged 18, natives of the town, who shall have served one master or mistress faithfully for three years successively; and the other years it is to be applied to the apprenticing of five boys. Dr. Charles Palmer, who died in 1717, founded a school for 20 boys, to be qualified for apprentices to mechanic trades; and Mrs. Martha Palmer founded a school for 12 girls, in 1723. This town was incorporated by James I., under an alderman, high steward, recorder, burgesses, and town clerk; and here all the courts for Windsor Forest are held. For many years there has been a singular custom of baiting two bulls in the market-place, on St. Thomas's day, for which purpose, a small estate was left by Mr. Staverton, for the purchase of a bull, to be given to the poor after being baited. The market on Tuesday is noted for its great supply

of poultry. Its fairs are the Thursday after Shrove Tuesday, 21st April, 11th June, 10th October, and 2d November. About 4 miles distant are the vestiges of a Roman entrenchment, called Cæsar's camp.

WOLA, a village of Poland, half a mile from Warsaw.

WOLANY, a small town of European Turkey, in Wallachia.

WOLBORCZ, a town of Poland; 66 miles south-west of Warsaw. Population 900.

WOLCHENBURG, a town of Prussia, in the New Mark of Brandenburg, situated on a lake; 116 miles east-north-east of Berlin. Population 1800.

WOLCOTT, a post township of the United States, in Orleans county, Vermont. Population 124.—2. A township of Newhaven county, Connecticut. Population 952.—3. A township of Cayuga county, New York, on south side of Lake Ontario; 200 miles west of Albany. Population 480.

WOLD, *s.* [*Wold*, whether singly or jointly, in the names of places, signifies a plain open country; from the Saxon *wold*, a plain and a place without wood. *Gibson*.]—A plain open country; downs.—St. Withold footed thrice the *wold*. *Shakspeare*.—Who sees not a great difference betwixt the *wolds* in Lincolnshire and the fens. *Barton*.—*Wold* and *wald* with the Saxons signified a ruler or governour; from whence *Bertwold* is a famous governour; *Ethelwold* a noble governour; *Herwald*, and by inversion *waldher*, a general of an army. *Gibson's Camden*.

WOLD, or OLD, a parish of England, in Northamptonshire. Population 374.

WOLDECK, or WOLDEGGE, a town of Germany; 21 miles east-by-north of Strelitz. Population 1800.

WOLDENBERG, a town of the Prussian province of Brandenburg; 54 miles east-north-east of Kustrin. Population 1700.

WOLDHAM, a parish of England, in Kent; 2½ miles south-west of Rochester.

WOLDINGHAM, a parish of England, in Surrey; 3 miles north-east-by-north of Godstone.

WOLD NEWTON, a parish of England, in Lincolnshire; 11½ miles north-by-east of Great Driffield.

WOLEIN, a town of Moravia; 34 miles west-north-west of Brunn. Population 1100.

WOLEN, a large village in the north of Switzerland, in the canton of Aargau.

WOLF, *s.* [*palp*, Saxon; *wolf*, Dutch; from the *M. Goth. wilwan*, rapere, diripere. *Serenius*.]—A kind of wild dog that devours sheep: thence any thing ravenous or destructive. See *CANIS*.

Advance our waving colours on the walls,
Rush'd in Orleans from the English *wolves*. *Shakspeare*.

An eating ulcer.—How dangerous it is in sensible things to use metaphorical expressions; and what absurd conceits the vulgar will swallow in the literals, an example we have in our profession, who having called an eating ulcer by the name of *wolf*; common apprehension conceives a reality therein. *Brown*.

WOLF (Christian), an eminent mathematician and philosopher, was born at Breslau in 1679, and well educated under able masters in different branches of literature and science. At the age of 21 he was entered at the university of Jena, which was then in high reputation; and, quitting Jena in 1702, he prosecuted his studies at Leipsic, where, in the following year, he took his degree of master of arts, publishing on the occasion a dissertation, intitled "Philosophia practica Universalis Mathematico modo conscripta." In 1704 he published another dissertation, on the differential and infinitesimal calculus. Having studied theology as well as philosophy at Leipsic, he officiated as a preacher; and being invited to undertake the office of pastor in a country village, he was advised by Leibnitz to decline it, and to pursue the study of philosophy. As he commenced his literary career with great reputation, he was proposed to be an associate in the periodical work, intitled "Acta Eruditorum;" and in this connection

nection he continued for many years, employing his leisure hours in teaching mathematics, logic, and natural philosophy. When the Swedes made an incursion into Saxony in the year 1706, he quitted Leipsic, and removed to Berlin; where a recommendatory letter of Leibnitz procured for him from Frédéric I. the office of professor of mathematics at Halle. In 1709 he published, in Latin, his treatise on "Aerometry;" and in the following year his "Elements of Mathematics;" in 4 vols., which have passed through several editions. Having composed a very ingenious essay on the intense cold of the ensuing winter, he was elected a member of the Royal Society of London, and soon after a member of the Academy of Sciences at Berlin. In 1711 he published his tables of sines and tangents, and in the next year his treatise on logic, in German, highly commended by Formey, and translated into Latin, French, and other languages. The first two volumes of his large work on the mathematics appeared in 1713, and these were afterwards followed by three more. By the advice of his friend Leibnitz, he refused an invitation from Peter the Great to remove from Halle to Petersburg. On the death of Leibnitz in 1726, Wolf drew up his life, which supplied Fontenelle with materials for his eulogy. In 1718 he published "Meditations on God, the World, and the Human Soul," which were reprinted in the following year. About this time the reputation of Wolf and the jealousy of his rivals occasioned a literary contest, which lasted for a considerable time, and which was not very honourable to either party. Wolf having delivered a dissertation on his quitting the pro-rectorate of Halle university in 1721, on which he took occasion to compare his own principles with those of Confucius and the Chinese, and having announced the opinion which he entertained on the doctrine of necessity, an outcry was raised against him, and he was represented by his enemies as a man whose principles tended to atheism, and to corrupt the morals of the people. Notwithstanding this malignant attack, he employed himself in publishing three volumes of experimental philosophy, and a volume of dogmatical philosophy, which he dedicated to the Emperor of Russia, and which the emperor caused to be translated into the Russian language, repeating to him the offers which had before been made, in order to induce him to remove to Petersburg. The contest that had been excited against him still continued; and though he attempted to justify himself in a treatise on the subject of fatality, the king was at length persuaded that his principles were dangerous, and ordered him, in November, 1723, to quit his territories in two days, under pain of death. Wolf immediately proceeded to Cassel, where he met with the King of Sweden, who appointed him professor of mathematics at Marburg, an office which he had refused 16 years before. The clergy of Halle pursued him with their enmity and opposition to Marburg; but Wolf was suffered to remain in the quiet enjoyment of his office during his residence at that place. Several students who attended him at Halle followed him hither, and his lectures, which he commenced in 1724, were attended by pupils from all parts of Europe. His mind being now undisturbed, he resumed his literary labours, and published his "Remarks on Metaphysics," in which he answered the principal objections against his doctrine, and gained a decided victory over his enemies. The grounds of the censure that had been passed on Wolf had been every where canvassed; and almost every German university was inflamed with disputes on the subject of liberty and necessity, so that the names of Wolfian and anti-Wolfian were every where heard. Wolf, having thus vindicated his philosophy from reproach, received new invitations from Petersburg and Leipsic; but gratitude to his protector induced him to remain in his situation at Marburg, which he found to be very agreeable, and to afford him leisure for pursuing his speculations. After an interval of nine years, the current of public opinion turned in favour of Wolf, and he now received numerous tokens of respect from men of rank and learning; and in 1733 he was invited to fill, in the Academy of Sciences, one of the eight places allotted to foreigners distinguished in the highest branches of

science. On this occasion, Reaumur and he commenced an intimate friendship, which lasted till the time of his death. The King of Prussia was convinced of Wolf's innocence, reversed his sentence of exile, and wished to repair the injury which he had sustained. He made tempting offers, both of title and money, to induce him to return to Halle; but he declined the acceptance of them; as he also refused an invitation from George I. of England to accept a place in the new academy which he had founded at Gottingen. The clergy of Halle made some other attempts to reproach and ruin him, but they recoiled on his adversaries. In the year 1740, he prefixed to the first volume of his "Droit Naturel, or Treatise on the Law of Nature," a dedication to the hereditary prince of Prussia, afterwards Frederick the Great, which was acknowledged by a very flattering letter.

Frederick the Great, as soon as he ascended the throne, recalled Wolf to Halle: and with the permission of the King of Sweden, he consented to accept the office of professor of the law of nature and nations, and also of mathematics, with a salary of 2000 crowns, and liberty to teach whatever he thought proper. He obtained also the rank of privy-counsellor, and was made first vice-chancellor, and afterwards chancellor of the university. In 1745 he was created a baron by the Elector of Bavaria. Wolf was now at the height of his prosperity. At more than 60 years of age he resumed his labours, and completed his work on the law of nature and nations, which was written in Latin, and extended to eight volumes 4to. He also wrote prefaces to the works of others, and particularly one to Sussmilch's work on population. Notwithstanding his great celebrity, perhaps on this account, he had many and powerful enemies. Leibnitz, Maupertuis, and Voltaire, were of this number: and with respect to the latter, we may observe, that both in his writings and in his conversation with the king he contributed in no small degree to lessen the veneration which Frederick II. entertained for him. In 1752 he was made a member of the Institute at Bologna; but he did not long survive this honour, as he died in the month of April, 1754, in the 76th year of his age. He left one son, who inherited a considerable estate which he had purchased.

Brucker sums up the character of Wolf as a writer in the following concise manner:—"He possessed a clear and methodical understanding, which by long exercise in mathematical investigations was particularly fitted for the employment of digesting the several branches of knowledge into regular systems; and his fertile powers of invention enabled him to enrich almost every field of science in which he laboured, with some new addition. The lucid order which appears in all his writings, enables his reader to follow his conceptions with ease and certainty through the longest train of reasoning. But the close connection of the several parts of his works, together with the vast variety and extent of the subjects on which he treats, renders it impracticable to give a summary of his doctrines."—*Brucker's Philosophy, by Enfeld. Preface to M. de Vattel's Law of Nations.*

WOLF (Jerome), a German philosopher, was born in the county of Oettingen, in the year 1516, and instructed in the elementary parts of education at a college established by the senate of Nuremberg. His death happened in the month of October, 1580. Wolf was particularly distinguished as a laborious translator, in which literary department he gained the commendation of Huet; though Henry Stephen censures his performances. When the edition of the Annals of Zonaras, published by Wolf, at Basle, in 1557, became rare, a new one, with notes by Du Cange, was printed at the Louvre, in Paris, in 1687. Wolf's translation of Demosthenes was first printed at Basle, by Oporinus; and being much approved, it passed through two other editions. After being revised by the translator, Episcopius printed it at Basle, in 1572, with the orations of Æschines, the commentaries of Ulpian, and the notes of Wolfius. His other works, which were numerous, almost wholly related to Greek and Latin authors.—*Eloges, par Formey et Teissier.*

WOLF (John Christopher), a German Lutheran divine and

and eminent scholar, was born in 1613, at Wernigeroda, and removing in 1695 to Hamburg, was educated under the protection of the celebrated Fabricius, by whom he was employed, under the age of 20 years, in making a catalogue of all the writers quoted in Eustathius's Commentary on Homer, afterwards inserted by Fabricius in his "Bibliotheca Græca." Having prosecuted his studies at Wittenberg, and graduated master of arts, he became, in 1706, adjunct of the philosophical faculty. Upon his return to Hamburg, he undertook a tour in 1708 through Holland to England, and for some time resided at Oxford for the use of the Bodleian library. His next migration to Denmark led, in 1710, to the appointment of extraordinary professor of philosophy, at Wittenberg, where his lectures collected a great number of pupils. Although he was here advanced to the chair of theology, he removed, in 1712, to Hamburg, and was appointed professor of the oriental languages in the Gymnasium, and in 1715 promoted to be rector of that institution. He was likewise a preacher-extraordinary at the cathedral, and became pastor of the church of St. Catherine; and soon after a member of the Academy of Sciences at Berlin. He commenced his literary contributions to the "Acta Eruditiorum" in 1708; and he collected from various repositories an astonishing number of rabbinical and oriental books and MSS.; which library he bequeathed to the library at Hamburg, where he died, in June, 1739. Of his numerous works, we shall here enumerate his "Bibliotheca Hebræa," in 4 vols. fol.; "Historia Lexicorum Hebraicorum;" "Primitiæ Flemsburgenses, sive Oratio de Præcocius eruditit, et Orationes binæ de Necessitate et Utilitate declamandi;" "Historia Bomogilorum;" "Dissertatio de Atheismi falso suspectis;" "Curæ philologicæ et criticæ in Novum Testamentum," 4 vols. 4to. He was also the editor of several learned works.—*Gen. Biog.*

WOLF ISLAND, a small island of the United States, in the Atlantic, near the coast of Georgia. Lat. 31. 19. N. long. 81. 30. W.

WOLF ISLAND, an island in the North Atlantic ocean, near the east coast of Labrador. Lat. 53. 55. N. long. 55. 40. W.

WOLF ISLAND, an island in the gulf of St. Lawrence, near the south coast of Labrador. Lat. 50. 2. N. long. 60. 55. W.

WOLF ISLAND, or **GRAND ISLE**, an island of North America, in Lake Ontario, which fronts the harbour of Kingston. It is 20 miles in length, and about 6 in extreme breadth. It is uncultivated, but very well clothed with oak, elm, ash, and pine timber, large quantities of which are continually felled for the use of the dock-yard. On the south side of it, a deep bay runs in so far as to leave an isthmus of no more than one mile in breadth. Up this bay is the general route from the south side of the St. Lawrence to Kingston.

WOLF RIVER, a river of the United States, in Louisiana, which falls into the Missouri; 464 miles from the Mississippi. It is about 60 yards wide at its mouth. It has its source near to that of the Kansas, and is navigable for boats some distance up.

WOLF RIVER, a river of the United States, in Tennessee, which runs into the Mississippi, north of Chickasaw Bluff.

WOLF RIVER, a river of the United States, in Mississippi, which runs south into the gulf of Mexico; 22 miles east of Pearl river. Length 140 miles. It forms a considerable bay at its mouth, called St. Louis' bay.

WOLF ROCK, a low, flat, rocky islet in the North Pacific ocean, about 12 miles from the southern shore of Prince of Wales's archipelago. It is surrounded by rocks and breakers, which extend a considerable distance from it; and it is on this account considered exceedingly dangerous to navigators. Lat. 55. 1. N. long. 226. 42. East.

WOLF ROCK, a rock near the east coast of Labrador, and not far from the island called Wolf island.

WOLFACH, a town of Germany, in Baden, at the con-

fluence of the Kinzig and the Wolfach; 18 miles south-east of Offenburg. Population 1300.

WOLFARTHS-HAUSEN, a town of Bavaria, on the Loisach; 17 miles south-by-west of Munich. Population 1000.

WOLFDOG, *s.* A dog of a very large breed, kept to guard sheep.

The luckless prey, how treach'rous tumblers gain,
And dauntless *wolfdogs* shake the lion's mane. *Tickell.*

A dog supposed to be bred between a dog and wolf.

WOLFEBOROUGH, a post township of the United States, in Strafford county, New Hampshire, on the north-east side of Lake Winnipiseogee; 50 miles north-north-west of Portsmouth. Population 1376.

WOLFEGG, a village of Germany, in Wirtemberg; 70 miles south-south-east of Stutgard. Population 900.

WOLFENBUTTEL, or **BRUNSWICK WOLFENBUTTEL**, an independent duchy of Germany, composed of several scattered territories in the circles of Upper and Lower Saxony, and Westphalia. It contains 1615 square miles, and 210,000 inhabitants. The whole is divided, for the purpose of local government, into six districts, of which the principality of Wolfenbuttel retains four. The northern part of the duchy, like the north of Germany in general, is level. The southern lies in a great measure in the district of the Hartz, and has the characteristics of a hilly country; in particular, the principality of Blankenburg. Their respective productions are in correspondence with this distinction of soil and climate, the north being a fine corn country, and productive also in flax, hemp, hops, and fruits; of which the most remarkable, in a commercial sense, are the plantations of chicory, used as a substitute for coffee. The rugged tracts to the south are in general unsuitable for either corn or flax; their wealth is derived from their forests, mines, and quarries; also, from the sheep reared on the hills, particularly in Blankenburg. The pastures are rich only in the vallies along the banks of the Seine and the Weser. The other rivers of note are the Ocker and the Ilmenau. The chief manufactures of the duchy consist of linen and lincn yarn; these, with the very different fabric of coffee from chicory, afford annual exports to a computed amount of 400,000*l.* The Lutheran is the religion of the state, and of the great majority of the inhabitants. The Catholics and Calvinists are only a few thousands in number. The seminaries are the university at Helmstadt, a school for youths of rank at Brunswick, and nine gymnasia or grammar schools at other places. The form of government is, as in most of the German principalities, that of a single head, checked, in some measure, by a parliament or states, composed of nobility, clergy, and deputies of the towns. The prince bears the title of duke of Brunswick and Lunenburg, and is a member of the Germanic Confederation. The public offices and courts of justice are almost as numerous as in a populous kingdom. Each district has its administration, and is divided into circles, with their respective jurisdictions. The revenue, amounting to 200,000*l.* a year, is at the disposal, partly of the duke, partly of the states. The personal income of the duke, in consequence of the successive lapse of the property of noble families, is larger than that of most German princes; he draws 15,000*l.* from the duchy of Oels in Silesia.

WOLFENBUTTEL, a city of Germany, and the capital of the principality of the same name, stands on the Oker; 37 miles east-south-east of Hanover. Its situation is pleasant, and its environs fertile; but they contain some marshes, which render the air somewhat unhealthy. It is fortified; but its works are now neglected. It is divided into the citadel or fortified part, and two suburbs. The public buildings are the castle, formerly the residence of the dukes of Brunswick, the three parish churches, the chancery, and the arsenal. The public library is very large; but the books are in general old. Wolfenbuttel has a gymnasium, called the Ducal high school; also other schools, and a Lutheran convent. It is the seat of a court of justice, of a consistory, and

and of several public offices. The manufactures, though on a small scale, comprise several articles, viz. linen, leather, soap, and silk. There is a number of gardens in the neighbourhood; and the road to Brunswick is pleasant, being planted on both sides with trees. Population 6700.

WOLFERLOW, a parish of England, in Herefordshire; 5 miles north-by-east of Bromyard.

WOLFERSDORF, a village of Prussian Silesia, in the county of Glatz, with 1500 inhabitants; 15 miles south of Glatz.

WOLFERSDORF, a village of Bohemia; 42 miles north of Prague. Population 1300.

WOLFERSDYK, a small island of the Netherlands, in the province of Zealand, situated between North and South Beveland, with 700 inhabitants.

WOLFERSHEIM, a town of Germany; 12 miles south-south-east of Wetzlar. Population 800.

WOLFHAGEN, a walled town of Germany, in Hesse-Cassel, on the Erpe, with 2100 inhabitants; 15 miles west of Cassel.

WOLFHAMCOTE, a parish of England, in Warwickshire. Population 417.

WOLFISH, *adj.* Resembling a wolf in qualities or form.

Thy desires

Are *wolfish*, bloody, starv'd, and ravenous. *Shakspeare.*

WOLFPASSING, a town of Germany, in Lower Austria, to the north of the Danube, with 1100 inhabitants.

WOLF'S NEWTON, a parish of England, in Monmouthshire; 5½ miles from Usk.

WOLFSBANE, *s.* [*aconitum*, Lat.] A poisonous plant; aconite. *Miller.*—*Wolfsbane* is an early flower. *Mortimer.*

WOLFSBERG, a town of Austrian Illyria, in Carinthia, on the river Lavant; 29 miles east-north-east of Clagenfurt. Population 1200.

WOLFSHAGEN, a village of Germany, in the duchy of Brunswick, to the west of Goslar. Population 1000.

WOLFSHALDEN, a village and parish of the Swiss canton of Appenzel; 9 miles east-by-north of St. Gall.

WOLFSMILK, *s.* [*tithymallus*, Lat.] An herb. *Ainsworth.*

WOLFSTEIN, a town of Germany, in Hesse-Darmstadt; 15 miles south-south-west of Mentz. Population 1100.

WOLGA, a river of Russia, which has the longest course, and, with the exception of the Danube, the largest volume of water, of any river in Europe. It rises among the Valdai mountains, in Lat. 57. N., and takes a direction in general to the eastward, but with many windings, until reaching the city of Kazan. The rivers that have hitherto flowed into it are, if we except the Oka, of second rate magnitude; but below Kazan it receives the Kama, which brings to it, like the Inn to the Danube, the tribute of a great extent of country. It now flows southward, with a great volume of water, and forms the boundary between Europe and Asia during several hundred miles, till reaching Tzarystyn, when, turning to the east, it approaches the Caspian, and after separating into a greater number of branches than the Nile or the Danube, discharges itself into that sea near Astracan. Its course is computed at the extraordinary length of 2700 miles; and the vast tract of country through which it flows being in general level, it is navigable, after passing Tver, in the early part of its course. In May and June its waters receive a great increase from the melting of the snow and ice; and the boatmen take advantage of the increased depth, to descend its current, and avoid those shallows and islands which at another season obstruct their course. From the vicinity of Tver northward, a communication is opened to the Msta, a river flowing northward to the Nieva; so that Russia in Europe admits of being traversed by water in all its extent. The principal rivers which join the Wolga, are the Tvertza, the Mologa, the Sestra, the Soscha, the Oka, the Sura, the Kasanka, the Kama, the Sok, and the Samara.

WOLGAST, a seaport of Prussia, in Pomerania, on the
VOL. XXIV. No. 1667.

river Peene, about four miles from the Baltic. It contains nearly 4000 inhabitants; and its chief branch of trade is the export of corn. The harbour is formed by the Peene; but admits only vessels of 120 tons burden. Here are seen the ruins of the ancient castle of the dukes of Pomerania; 30 miles east-south-east of Stralsund.

WOLHOPE, a parish of England, in Herefordshire; 8 miles south-east of Hereford. Population 485.

WOLIN, or WOLYNIE, a town of Bohemia; 68 miles south-south-west of Prague. Population 1300.

WOLITZ, a town of Bohemia, in the circle of Beraun. Population 900.

WOLKENSTEIN, a town of Germany, in Saxony; 12 miles-south-by-east of Chemnitz, on the river Zschopa. Population 900.

WOLKERSDORF, a town of Germany, in Austria, in the circle below the Mannhartzberg. Population, with the parish, 1700.

WOLKWITZ, a town of Germany, in Saxony; 6 miles south-east of Leipsic, with 700 inhabitants.

WOLLAMAI, CAPE, the east point of Philip island, on the south coast of New Holland. Lat. 38. 38. S. long. 145. 25. E.

WOLLAND, a parish of England, in Dorsetshire; 9 miles north-by-west of Blandford Forum.

WOLLASTON (William), an ethical writer, was born in 1659, at Cotton Clanford, in Staffordshire, and finished his education as a pensioner of Sidney college, Cambridge. In 1681 he commenced M.A., and entered into deacon's orders. His first settlement was as an assistant in the free school at Birmingham, to which a small lectureship was annexed; and about four years afterwards he was advanced from this laborious situation to the office of second master in the same school. In 1688 a relation died, whose decease put him in possession of a considerable landed estate, upon which he removed to London, and marrying a lady of considerable fortune, he resided in Charterhouse-square. Dismissing all thoughts of church preferment, he devoted himself to the retirement of private life and to a course of study, comprehending the learned languages, together with Hebrew and Arabic. The first publication which issued from the press, was a poem on Ecclesiastes, which he would afterwards have suppressed, from a conviction that his talents were not adapted to poetry. In the progress of his life and literary pursuits, he was so much amused by composition, that he wrote many treatises on various subjects, both in Latin and English, which he committed to the flames. Of the well-known work which has perpetuated his name, and which is entitled "The Religion of Nature delineated," he printed a few copies to be distributed among his friends in 1722, but his declining health prevented his completing his original design. However, in 1723, he was prevailed upon to revise what he had printed for publication, and it accordingly appeared in 1724, in which year he died, at the age of 65, leaving a large family, and having lost his wife, to whom he was affectionately attached, about four years before. In his private character he is said to have exemplified the virtues which his work inculcated. The system which he developed, and which founded morality upon "truth," excited much attention, and his book, though not written in a popular manner, passed through seven editions to the year 1750. The last of these editions includes an appendix, consisting of a translation of the Latin notes by Dr. J. Clarke, dean of Salisbury, undertaken at the particular request of queen Caroline, who was a great admirer of the work. Dr. Warburton, in his strictures on Wollaston's theory in his Divine Legation, honours the author by ranking him as "one of our most celebrated writers," and compliments him with having "demonstrated with greater clearness than any before him the natural essential difference of things;" and though modern systems have, in a considerable degree, antiquated that of Mr. Wollaston, the author must always be regarded as a man of extensive learning and strong reasoning powers.—*Biog. Brit.*

WOLLASTON, a parish of England, in Northamptonshire;
7 Q

shire; 3 miles south-by-east of Wellingborough. Population 849.

WOLLATON, a parish of England, in Nottinghamshire, near Nottingham.

WOLLAWOLLAH, a river of North America, which runs into the Columbia, below Lewis's river.

WOLLAWOLLAH INDIANS, in North America, on the Columbia, at the mouth of Lewis's river. Number 1600.

WOLLESCOT, a hamlet of England, in Worcestershire, parish of Old Swinford.

WOLLEY, a parish of England, in Somersetshire; 3 miles north of Bath.

WOLLAUSEN, a small town in the north of Switzerland; 9 miles south-west of Lucerne.

WOLLIN, an island, or rather insulated district, of Pomerania, surrounded by the arm of the sea called the Great Haf, by the rivers Swine and Diwenow, and by the Baltic. Its area is about 95 square miles, and its population nearly 6000.

WOLLIN, the chief town of the above island, stands on the river Diwenow; 28 miles north of Stettin. It contains 2300 inhabitants, who follow a variety of employments; but chiefly fishing and navigation.

WOLLISHOFEN, a village of Switzerland, on the lake of Zurich.

WOLLNZACH, a town of Bavaria, on the Iler; 12 miles south-east of Ingolstadt. Population 1200.

WOLLRAU, a village of Switzerland, in the canton of Schweiz, near the lake of Zurich; 5 miles west-south-west of Rapperschweil.

WOLLSTEIN, a town of Prussian Poland; 14 miles west-south-west of Posen. It has nearly 2000 inhabitants.

WOLLSTEIN, a town of Germany, in Hesse-Darmstadt; 16 miles south-west of Mentz. Population 1100.

WOLMERSTADT, a town of Prussian Saxony, on the river Ohre; 8 miles north of Magdeburg. Population 2300.

WOLNIKA, a river of Bohemia, which runs into the Wattawa, at Strakonitz.

WOLSEY, or WULCEY (Thomas, Cardinal), was the son of a butcher at Ipswich, Suffolk, and born there in 1471. See ENGLAND.

WOLSEY, a hamlet of England, in the parish of Diss, Norfolk.

WOLSINGHAM, a town and parish of England, in the county of Durham, on the Wear. Fair on the 18th of May; 25½ miles north-north-west of London. Population 1983.

WOLSLINGTON, a hamlet of England, in Northumberland; 6 miles from Newcastle.

WOLSTANTON, a parish of England, in Staffordshire; 1½ mile north-by-east of Newcastle-under-Lyne. Population 843.

WOLSTHORPE, a hamlet of England, in the parish of Lowdham, Nottinghamshire.

WOLSTON, a parish of England, in Warwickshire; 9 miles from Coventry. Population 559.

WOLTERTON, a parish of England, in Norfolk; 4 miles north-north-west of Aylesham.

WOLTIN, a small town of Prussia, in Pomerania; 12 miles south-west of Stargard.

WOLVERCOTE, a parish of England, in Oxfordshire; near Oxford.

WOLVERGHEM, or VOLVERTHEM, a small town of the Netherlands; 8 miles north of Brussels; with 1300 inhabitants.

WOLVERHAMPTON, a market town of England, in the county of Stafford. It is a well built and healthy town, notwithstanding its vicinity to numerous coal mines; a circumstance which it owes to its elevated situation. The trade which it carries on in locks, keys, and such like articles, is truly astonishing. Nothing indeed can exceed the ingenuity and skill of its locksmiths, their productions surpassing, both in beauty and usefulness, all articles of the same kind made in any other district of England. Most of the farmers in the neighbourhood have their forges, where they work when not employed in the field, and take their work to market as regularly as other farmers do their corn, whence it

is bought up for various parts, and finds a ready market throughout Europe: many of the women are assistants to these manufactures, and work at the file. This town, however, notwithstanding its extensive manufacture, does not increase in houses so rapidly as some other towns in the interior. The evident cause to be assigned in explanation of this fact is, that the land here is almost wholly church land; which is not a tenure sufficient to encourage people to lay out their money in erecting buildings. The buildings are tolerably good, of brick and tile, but have a sombre appearance, and the streets are narrow and dirty. It has two churches. The collegiate church, now dedicated to St. Peter, is very agreeably situated on elevated ground towards the eastern side of the town. It is a stone building, consisting of a lofty nave, two aisles, and a chancel. The latter is most incongruously fitted up in the modern taste. A very fine Gothic tower, embattled at the top, and richly ornamented, rises from the centre. Five pointed arches, resting on octagonal pillars, support the nave. The pulpit, which is composed of stone, is an object of great interest and curiosity. It is placed against one of the south pillars, and is adorned with very beautiful sculptured niche work. A flight of steps forms the basement of this pulpit, at the foot of which is fixed the figure of a large lion, executed in a very superior style. To the south of the tower, in Mr. Leveson's chancel, formerly called the Lady Chapel, stands an alabaster monument, to the memory of John Leveson and his wife, who died in 1575. The figure of the man is in armour. The great chancel contains a fine full length statue of brass, in honour of the celebrated admiral sir Richard Leveson, who commanded under sir Francis Drake, against the Spanish Armada. The noble tomb of colonel John Lane, who distinguished himself by his attachment to Charles II., stands in a small chancel, usually called Mr. Lane's chancel. Here is likewise a curious stone font, of an octagonal shape, and evidently of great antiquity. On the shafts, in bas relief, are the figures of St. Anthony, St. Paul, and St. Peter. The first bears a palm branch and shield, the second holds a club, and the third has his hands raised in the act of supplication. The other parts of this font are beautifully embellished with crosses, sprigs, tulips, roses, and a multiplicity of other flowers. In the church-yard, fronting the south porch, stands a round column, twenty feet in height, and displaying a vast profusion of rude sculpture work, arranged in separate compartments. The precise site of the monastery founded here by Wulfruna, is not perfectly ascertained. Towards the south-west corner of this cemetery may be still seen a very large room or vault, about 30 feet square, supported by strong massy groins, which meet in the centre of the roof. This work is entire and unmutated, and seems to have been the basement story of an edifice of considerable magnitude. The wall is three yards thick, and on both sides of the doorway are some slight vestiges of sculptured cornice stones. The other church, dedicated to St. John, was erected by subscription, an act of parliament having been obtained for this purpose in the year 1755. A deficiency of funds, however, prevented it from being completed till the year 1776. It is built of stone, and is pewed and painted according to the taste of modern times. These are the only churches belonging to the establishment in this populous town, and there are not more than three chapels besides. The dissenting chapels are numerous. The free school is a handsome brick building, founded and endowed by sir Stephen Jennings, a native of this town, and lord mayor of London, in the year 1668. Besides this school, there are two charity ones for fifty boys and forty girls. An hospital for a priest and six old women was erected here, under the sanction of the royal licence, about the year 1394, by Clement Lusen and Willam Waterfall. The workhouse is an inconvenient structure, with small windows, low rooms, and dark staircases. The lighting, paving, and cleaning of the streets, is conducted under an act of parliament. Wolverhampton is a place of great antiquity; but nothing is recorded concerning its history till the year 996, when we are informed that the pious Wulfruna, relict of Aldhelm duke of Northampton, built and endowed a monastery

a monastery here. Previous to this period, its name was simply Hampton; but it now began to be distinguished by the appellation of Wulfrune's Hampton, since modified or corrupted into the term Wolverhampton. The principal market day is Wednesday; but an inferior one is likewise held on Saturday. Two canals, the Staffordshire and Worcestershire Grand Trunk, and the Birmingham canal, pass in this immediate vicinity, and form a junction about a mile to the north. The fair is on the 10th July. The population of the town alone, 14,836 persons, viz. 7355 males, and 7481 females. Of this number, 2989 families were returned as employed in the various branches of trade and manufactures; 16 miles south of Stafford, and 130½ north-west of London.

WOLVERLEY, a township of England, in Worcestershire; 1½ mile north-west of Kidderminster. Population 1164.

WOLVERTON, a parish of England, in Buckinghamshire; 1 mile east-north-east of Stony Stratford.—2. A parish in Norfolk; 2½ miles north of Castle Rising.—3. A parish in Somersetshire; 4 miles north-by-east of Frome.—4. A parish in Warwickshire; 5½ miles west-south-west of Warwick.

WOLVES ISLANDS, a cluster of small islands of the United States, near the east coast of Maine. Lat. 45. 4. N. long. 65. 50. W.

WOLVES, NEWTON, a parish of England, in Monmouthshire; 5 miles from Usk.

WOLVEY, a village and parish of England, in the county of Warwick; 5½ miles south-east-by-east of Nuneaton. Population 803.

WOLVISH, *adj.* Resembling a wolf.

Why in this *wolvish* gown do I stand here,
To beg of Hob and Dick? *Shakespeare.*

WOLVISTON, a township of England, in Durham; 4½ miles north-by-east of Stockton-upon-Tees.

WOLXHEIM, a village in the north-east of France, in Alsace. Population 900.

WOMAN, *s.* [pīman, pīman, Saxon; whence we yet pronounce *women* in the plural, *wimmen*. *Skinner and Wallis*.]—The female of the human race.

That man who hath a tongue is no man,
If with his tongue he cannot win a *woman*. *Shakespeare.*

A female attendant on a person of rank.

I could not personally deliver to her
What you commanded me; but by her *woman*,
I sent your message. *Shakespeare.*

To **WO'MAN**, *v. a.* To make pliant like a woman.

I've felt such quirks of joy and grief,
That the first face of neither on the start
Can *woman* me unto't. *Shakespeare.*

WO'MANED, *adj.* Accompanied or united with a woman.
I do attend here on the general,
And think it no addition, nor my wish,
To have him see me *woman'd*. *Shakespeare.*

WO'MANHATER, *s.* One that has an aversion to the female sex.

How could it come into your mind,
To pitch on me of all mankind,
Against the sex to write a satire;
And brand me for a *womanhater*. *Swift.*

WO'MANHEAD, or **WO'MANHOOD**, *s.* The character and collective qualities of a woman. *Obsolete.*

Ne in her speech, ne in her haviour,
Was lightness seen, or looser vanity,
But gracious *womanhood* and gravity. *Spenser.*

WO'MANISH, *adj.* Suitable to a woman; having the qualities of a woman; resembling a woman.

The godlike hero, in his breast
Disdain'd, or was asham'd to show
So weak, so *womanish* a woe. *Dryden.*

WO'MANISHLY, *adv.* In a womanish manner.—His hair curled, and *womanishly* dishevelled. *Comment on Chaucer.*

WO'MANISHNESS, *s.* State or quality of being womanish.—Effeminacy and *womanishness* of heart. *Hammond.*

To **WO'MANIZE**, *v. a.* To emasculate; to effeminate; to soften. Proper, but not used.—This effeminate love of a woman doth *womanize* a man. *Sidney.*

WO'MANKIND, *s.* The female sex; the race of women. Musidorus had over bitterly glanced against the reputation of *womankind*. *Sidney.*

Because thou doat'st on *womankind*, admiring
Their shape, their colour, and attractive grace,
None are, thou think'st, but taken with such toys. *Milton.*

WO'MANLY, *adj.* Becoming a woman; suiting a woman; feminine, not masculine.

I'm in this earthly world, where to do harm
Is often laudable; to do good sometime
Accounted dangerous folly: why then, alas!
Do I put up that *womanly* defence,
To say I'd done no harm? *Shakespeare.*

Not childish; not girlish.—Young persons, under a *womanly* age, are often troubled with some of the same symptoms. *Arbutnot.*

WO'MANLY, *adv.* In the manner of a woman; effeminately.

Sing lullabies as women do,
With which they charm their babes to rest;
And lullaby can I sing too,
As *womanly* as can the best. *Gascoigne.*

WOMAT POINT, a rocky projection of Cape-Barren-Island, between Van Diemen's Land and the south-west coast of New Holland.

WOMB, *s.* [*wamba*, Goth., *pamb*, Sax., *wamb*, Icel.] The place of the fœtus in the mother.—When yet he was but tender-bodied, and the only son of my *womb*. *Shakespeare.*—The place whence any thing is produced.

The earth was form'd, but, in the *womb* as yet
Of waters embryon immature involv'd,
Appeared not. *Milton.*

Any cavity.

An amphitheatre unpeopled Rome,
And held, uncrowded, nations in its *womb*. *Addison.*

To **WOMB**, *v. a.* To enclose; to breed in secret.

Not for all the sun sees, or
The close earth *wombs*, will I break my oath
To this my fair belov'd. *Shakespeare.*

WOMBDON, a village of England, in Somersetshire; 1½ mile from Bridgewater.

WOMBINELLORE, a town of the south of India, district of Salem. Lat. 11. 44. N. long. 78. 10. E.

WOMBLETON, a township of England, in Yorkshire; 4 miles east of Helmsley.

WOMBOURNE, a parish of England, in Staffordshire; 4 miles south-west of Wolverhampton. Population 989.

WOMBRIDGE, or **WAMBRIDGE**, a parish of England, in Salop; 2 miles east of Wellington. Population 1944.

WOMBWELL, a township of England, West Riding of Yorkshire; 5 miles south-east of Barnesly. Population 745.

WO'MBY, *adj.* Capacious. *Not in use.*

He'll call you to so hot an answer for it,
That caves and *womby* vaultages of France
Shall chide your trespass, and return your mock,
In second accent to his ordnance. *Shakespeare.*

WOMELSDORF, a post township of the United States, in Berks county, Pennsylvania; 68 miles west-north-west of Philadelphia.

WO'MEN. Plural of *woman*.

Thus it shall befall
Him who to worth in *women* over-trusts. *Milton.*

WOMENSWOLD,

WOMENSWOLD, or WIMLINGSWOLD, a parish of England, in Kent; 5 miles south-by-west of Wingham.

WOMERSLEY, a parish of England, in Yorkshire; 5½ miles east-south-east of Pontefract.

WOMESLEY, a hamlet of England, near Lyme Regis, Dorsetshire.

WON. The preterite and participle passive of *win*.

All these the Parthian,
From the luxurious kings of Antioch *won*. *Milton*.

To WON, *v. n.* [ponian, punian, Saxon; *wonen*, German.] To dwell; to live; to have abode. It is still a northern word, at least in Lancashire, and pronounced *wun*.

Out of the ground uprose
As from his lair, the wild beast where he *wons*
In forest wild. *Milton*.

WON, *s.* Dwelling; habitation.

What secret place, quoth he, can safely hold
So huge a mass, and hid from heaven's eye;
Or where hast thou thy *won*, that so much gold
Thou can'st preserve from wrong and robbery. *Spenser*.

WONASTOW, a parish of England, in Monmouthshire, near Monmouth.

WONDA, a small town of Manding, in Central Africa, the Mansa of which is at once chief magistrate and school-master; 30 miles north-east of Kamalia.

To WONDER, *v. n.* [punɔnjan, Saxon; *wonder*, Dutch.] To be struck with admiration; to be pleased or surprised so as to be astonished: with *at*, rarely with *after*.—King Turnus *wonder'd* at the fight renew'd. *Dryden*.—To doubt: as, I *wonder* whether he will be here in time. A colloquial expression.

WONDER, *s.* [punɔnɔn, Saxon; *wonder*, Dutch.] Admiration; astonishment; amazement; surprise caused by something unusual or unexpected.

What is he, whose griefs
Bear such an emphasis? whose phrase of sorrow
Conjures the wand'ring stars, and makes them stand
Like *wonder-wounded* hearers. *Shakspeare*.

Cause of wonder; a strange thing; something more or greater than can be expected.

What woman will you find,
Thought of this age the *wonder* and the fame,
On whom his leisure will vouchsafe an eye
Of fond desire? *Milton*.

Any thing mentioned with wonder.—There Babylon the *wonder* of all tongues. *Milton*.—Ample souls among mankind have arrived at that prodigious extent of knowledge which renders them the *wonder* and glory of the nation where they live. *Watts*.

WONDERER, *s.* One who wonders. *Barret*.

WONDERFUL, *adj.* Admirable; strange; astonishing.

Strange
Hath been the cause, and *wonderful* to hear. *Milton*.

WONDERFUL, *adv.* To a wonderful degree. Improperly used.—The house which I am about to build shall be *wonderful* great.

WONDERFULLY, *adv.* In a wonderful manner; to a wonderful degree.—There is something *wonderfully* divine in the airs of this picture. *Addison*.

WONDERFULNESS, *s.* State or quality of being wonderful or amazing.—There stood between them a young maid, whose *wonderfulness* took away all beauty from her. *Sidney*.

WONDERMENT, *s.* Astonishment; amazement. *Not in use, except in low or sarcastic language.*

When my pen would write her titles true,
It ravish'd is with fancy's *wonderment*. *Spenser*.

Wonderful appearance; wonderful relation.

Some strangers of the wiser sort
Made all these idle *wonderments* their sport. *Dryden*.

WONDEROUS, *adj.* See WONDROUS. The word is now usually written *wonderous*.

WONDERSTRUCK, *adj.* Amazed.

Ascanius, *wonderstruck* to see
That image of his filial piety. *Dryden*.

WONDER-WORKING, *adj.* Doing surprising things.—The *wonder-working* dill he gets. *Drayton*.—He commends the mathematics, as the only *wonder-working* knowledge, and therefore requiring the best spirits. *Herbert*.

WON'DROUS, *adj.* Admirable; marvellous; strange; surprising.

The credit of whose virtue rest with thee;
Wondrous indeed, if cause of such effects. *Milton*.

[*Wondrous* is barbarously used for an adverb.] In a strange degree.

To shun the allurements is not hard
To minds resolv'd, forewarn'd and well prepar'd;
But *wond'rous* difficult, when once beset,
To struggle through the straits, and break th' involving net. *Dryden*.

WON'DROUSLY, *adv.* To a strange degree.—My lord led *wondrously* to discontent. *Shakspeare*.—In a strange manner.—Then medicines *wond'rously* compos'd, the skillful leech applied. *Chapman*.

WONERSH, or OGNERSH, a parish of England, in Surrey; 3½ miles south-south-east of Guildford. Population 814.

WONGROWICZ, a town of Prussian Poland, on the small River Welna, with 900 inhabitants; 30 miles north-north-east of Posen.

WONSEES, a small town of Bavaria, in Upper Maine, on the small river Keinach.

WONSEL, a village of the Netherlands, in North Brabant, with 2200 inhabitants; 3 miles north of Eindhoven.

WONSOSZ, a town of Poland; 27 miles north-by-east of Lomza. Population 800.

WONSTON, a parish of England, in Southamptonshire; 5½ miles south of Whitchurch. Population 609.—2. A hamlet in the parish of Throwley, Devonshire.

To WONT, or To be WONT, *v. n.* [preterite and participle *wont*; punian, Saxon; *gewoonen*, Dutch.] To be accustomed; to use; to be used.

I this night have dream'd;
If dream'd, not as I oft am *wont*, of thee,
But of offence and trouble. *Milton*.

WONT, *s.* Custom; habit; use. *Out of use*.

'Tis not his *wont* to be the hindmost man,
Whate'er occasion keeps him from us now. *Shakspeare*.

WON'T, a contraction of *would not*: used for *will not*.

WON'TED, *part. adj.* Accustomed; used; usual: used both of persons and things.

So pray'd they, innocent, and to their thoughts
Firm peace recover'd soon and *wonted* calm. *Milton*.

Who have no house, sit round where once it was,
And with full eyes each *wonted* room require;
Haunting the yet warm ashes of the place,
As murder'd men walk where they did expire. *Dryden*.

WON'TEDNESS, *s.* State of being accustomed to. *Not in use*.—Did I see any thing more of Christ in those that pretend to other modes of government, I might suspect my judgement biased with prejudice or *wontedness* of opinion. *King Charles*.

WON'TLESS, *adj.* Unaccustomed; unusual. *Obsolete*.

Whither, love, wilt thou now carry me?
What *wontless* fury dost thou now inspire
Into my feeble breast, when full of thee? *Spenser*.

WONTON, a hamlet of England, in Herefordshire, on the Avon, near Ashburton.

To WOO, *v. a.* [apogob, courted, Saxon; pogepe, a suitor or lover. Our old word is *wow*, or *wowe*. "With gifts he oft her *wowed*." *Spenser, F. 2.*—To court; to sue to for love.

We cannot fight for love, as men may do;
We should be *woo'd*, and were not made to *woo*. *Shakspeare*.

To court solicitously; to invite with importunity.

Yet can she love a foreign emperor,
Whom of great worth and pow'r she hears to be;

If she be *woo'd* but by ambassador,

Or but his letters or his pictures see:

So while the virgin soul on earth doth stay,

She *woo'd* and tempted is ten thousand ways

By these great pow'rs, which on the earth bear sway,
The wisdom of the world, wealth, pleasure, praise. *Davies*.

To WOO, *v. n.* To court; to make love.

With pomp, and trains, and in a crowd they *woo*,
When true felicity is but in two. *Dryden*.

WOOD, *adj.* [*woods*, Gothic; *poð*, Saxon; *woed*, Dutch.] Mad; furious; raging. Written also *wode*. A provincial term for *angry*, almost mad with anger.—Sure these wanton swains are *wode*. *Fletcher*.

WOOD, *s.* [*pube*, Saxon; *woud*, Dutch.] A large and thick collection of trees.

St. Valentine is past:

Begin these *wood*-birds but to couple now? *Shakspeare*.

Light thickens, and the crow

Makes wing to the rooky *wood*. *Shakspeare*.

The substance of trees; timber.

Balm his foul head with warm distilled waters.

And burn sweet *wood* to make the lodging sweet.

Shakspeare.

WOOD (Anthony), the *Oxford Antiquary*, was born at Oxford in 1632, and entered of Merton college in 1647. Having commenced M. A., and acquired a taste for studies pertaining to antiquity, he pursued with indefatigable diligence both at Oxford and in London researches, which furnished him with materials for his "History and Antiquities of the University of Oxford," a copy of which he sold to the university in 1669 for 100*l.* It was written in English, but afterwards translated into Latin, under the inspection of Dr. Fell; and the version was published from the Oxford press in 1674, under the title of "Historia et Antiquitates Universitatis Oxoniensis, duobus Voluminibus comprehensa," fol. The first part of this work includes the annals of the university, from its earliest period to the year 1648; and the second contains an account of all its particular foundations, endowments, officers, &c. The translation is badly executed, and Wood, the original author, was destitute of those qualifications that would have rendered him a fit historian of a learned university. Another of Wood's works was his "Athenæ Oxonienses; or, an Account, in English, of almost all the Writers educated at Oxford, and many of those at the Sister University, from the year 1500." It was first published in 1691, 2 vols. fol., and soon after subjected him to a prosecution in the vice-chancellor's court for his account of Lord Clarendon, and to various other attacks, occasioned by his partialities, and more especially by his strong bias in favour of popery. His style is vulgar, and his sentiments illiberal and unphilosophical; but his veracity entitles him to confidence. He died in 1695, and bequeathed his books and papers to the university of Oxford. A second edition of this work, corrected and enlarged from the author's MS., was published in 1721.—*Biog. Brit.*

WOOD, a hamlet of England, in the parish of Ashill, Somersetshire.

WOOD, a county of the United States, in the north-west part of Virginia, bounded on the north-east by Ohio and Harrison counties, on the south-east by Harrison and Kenhawa counties, on the south-west by Kenhawa and Mason counties, and on the north-west by the Ohio. Population 3036. Slaves 450.

WOOD'S BAY, a sandy bay in the straits of Magellan, on the South American shore, in which there is good anchoring. Lat. 53. 58. S. long. 72. 55. W.

WOOD CREEK, a river of the United States, in New Vol. XXIV. No. 1667.

York, which runs north into the south end of Lake Champlain. Length 23 miles.

WOOD CREEK, a river of the United States, in Oneida county, New York, which runs west into Oneida lake. It is connected with the Mohawk by a canal $1\frac{1}{2}$ mile long, and navigable for boats of 12 or 15 tons.

WOOD CREEK. See PRESTON'S CREEK.

WOOD ISLAND, a small island of the United States, near the coast of Maine; 15 miles north-east of Cape Porpoise. Lat. 43. 26. N. long. 70. 24. W.

WOOD POINT, a cape of Scotland, at the east extremity of the county of Fife; 2 miles north of St. Andrew's.

WOOD RIVER, a river of North America, which falls into the Mississippi, opposite to the entrance of the Missouri. Lat. 38. 55. 19. N. long. 89. 57. 45. W.

WOODAH ISLE, a long curved island in the gulf of Carpentaria, on the west coast, extending about 13 miles in length. Lat. of its northern point, 13. 22. S.

WOOD-ANE'MONE, *s.* A plant.

WOODBANK, a township of England, in the parish of Shotwick, Cheshire.

WOODBASTON, a hamlet of England, in Staffordshire, adjoining to Penkridge.

WOODBASTWICK, a parish of England, in Norfolk; 5 miles north-west of Acle.

WOODBERRY, a township of the United States, in Huntingdon county, Pennsylvania. Population 1167.

WOODBIND, or WOOD'BINE, *s.* [*pubbind*, Saxon; *periclymenon*, Lat.] Honeysuckle. See LONICERA.

Beatrice, e'en now

Couch'd in the *woodbine* coverture. *Shakspeare*.

WOODBOROUGH, a parish of England, in Nottinghamshire; 6 miles north-east of Nottingham. Population 611.—2. A hamlet in the parish of Wellow, Somersetshire.—3. A parish in Wiltshire, near Pewsey.

WOODBRIDGE, a market town of England, in the county of Suffolk, situated in a long narrow tract, nearly surrounded by the hundreds of Carlford and Wilford, on the east side of a sandy hill, commanding a pleasant view down the river Deben, which falls into the sea at the distance of about ten miles. The principal streets of Woodbridge, one of which is near a mile in length, though narrow, contain many good houses, and are tolerably well paved. The market-place is clean and well built; and in the middle of it is an ancient shire-hall, in which the quarter sessions for the liberty of St. Etheldred are held; and under the court-house is the market-hall. The church, a spacious and noble structure, is conjectured to have been built in the reign of Edward III., by John lord Segrave, and his wife Margaret de Brotherton, whose arms are yet to be seen over the door of the steeple. It consists of a nave and two aisles, the roofs of which are supported by ten beautiful Gothic pillars, and four demy ones. The exterior walls are of black flints. Adjoining to the chancel on the north side is a private chapel, erected by Thomas Seckford, esq., master of requests in the reign of queen Elizabeth; the east window of which is adorned with a fluted pilaster. The north portico is decorated in front with the representation, in relief, of Michael, the archangel, encountering the dragon. In the church were formerly the altars of St. Anne and St. Saviour, and the chapel of St. Nicholas in the north aisle; and either in the walls of the church, or in the church-yard, stood a celebrated image of Our Lady, to whom this edifice was dedicated. The large quadrangular tower, 108 feet high, forms a conspicuous object at sea: it is built of the same materials as the church; and towards the top the flint and stone are beautifully intermixed in various devices. The corners are finely ornamented; and on the battlements between them are the badges of the four evangelists. This steeple, with the north portico, was built, or perhaps more correctly speaking, repaired, about the middle of the 15th century, as appears from numerous legacies bequeathed about that time by various persons. Upon a stone inserted in the wall of the north side, at about the height of 24 feet, is a mutilated inscription, upon

which the name of Albrede, one of these benefactors, may easily be discerned. On the south side of the church formerly stood a priory of Augustines, founded by sir Hugh Rous, or Rufus; but at what time we are not informed. Here are also an Independent, Baptist, Methodist, and Quakers' meeting-houses; a grammar-school, two alms-houses, three public fire-offices, and two banks. The river being navigable for vessels which trade to London, Hull, Newcastle, and the Continent, it has a considerable traffic, and a dock for building vessels, with convenient wharfs and quays. Its name is supposed to have been originally derived from a wooden bridge, built over the road in a hollow way, communicating with two parks; and there is still a house at the foot of the hill called Drybridge, supposed to have been erected on the site thereof. On the site of its ancient priory is erected a handsome mansion, the seat of admiral Carthew. Of late years a statute-sessions has been held here on the day after Old Michaelmas day, for hiring servants, &c. The market on Wednesday is well supplied, and its fairs are the 5th April and 2d October; $8\frac{1}{2}$ miles east-north-east of Ipswich, and $77\frac{1}{2}$ north-east-by-east of London. Population 4332.

WOODBIDGE, a township of the United States, in New Haven county, Connecticut; 7 miles north-west of New Haven. Population 2030.

WOODBIDGE, a post township and village of the United States, in Middlesex county, New Jersey, west of Arthur Kull Sound; 3 miles north-north-west of Amboy. Population 4247. The village contains an Episcopal and Presbyterian church.

WOODBURY, a parish of England, in Devonshire; 3 miles east-south-east of Topsham. Population 1361.—2. A hamlet in Dorsetshire; 6 miles from Wareham.

WOODBURY, a township of the United States, in Caledonia county, Vermont; 19 miles north-east of Montpelier. Population 254.—2. A post township of Litchfield county, Connecticut; 16 miles south of Litchfield. Population 1963.

WOODBURY, a post town of the United States, and capital of Gloucester county, New Jersey; 9 miles south of Philadelphia. It contains a court-house, a jail, an academy, and a Quaker meeting-house, and upwards of 100 houses.—2. A township of Bedford county, Pennsylvania. Population 1658.

WOODCHESTER, a village and parish of England, in the county of Gloucester. Here is a well endowed free grammar school; and it has manufactures of silk, and of fine broad cloth; $2\frac{1}{2}$ miles south-west of Stroud. Population 845.

WOODCHURCH, a township of England, in Cheshire; $6\frac{1}{2}$ miles north-by-west of Great Neston.—2. A parish in Kent; 5 miles east of Tenterden. Population 870.

WOODCOCK, *s.* [pobucoc, Saxon; *scolopax*, Latin.] A bird of passage with a long bill; his food is not known. It is a word ludicrously used for a dunce.—He hath bid me to a calve's head and a capon; shall I not find a *woodcock* too? *Shakspeare*.

WOODCOT, a township of England, in the parish of Wrenbury, Cheshire.—2. A hamlet in Dorsetshire; 5 miles from Sandwich.—3. A hamlet in Salop; $2\frac{1}{2}$ miles from Newport.—4. A parish in Southamptonshire; 5 miles north-north-west of Whitchurch.

WOODCOTE, a township of England, in Warwickshire; $3\frac{1}{2}$ miles from Warwick.

WOODCROFT, a hamlet of England, in Northamptonshire; $5\frac{1}{2}$ miles north-west of Peterborough.

WOOD-DALLING, a parish of England, in Norfolk; 3 miles north-by-west of Reepham. Population 480.

WOOD-DITTON, a parish of England, in Cambridge-shire; 2 miles from Newmarket. Population 758.

WOODDRINK, *s.* Decoction or infusion of medicinal woods, as sassafras.—The drinking elder-wine or *wooddrinks* are very useful. *Floyer*.

WOOD-EATON, a parish of England, in Oxfordshire; 4 miles north-north-east of Oxford.—2. A hamlet in the parish of Church Eaton, Staffordshire, near Penkridge.

WOODED, *adj.* Supplied with wood.

Wooded so,
It makes a spring of all kinds that grow. *Chapman*.

WOODEN, *adj.* Ligneous; made of wood; timber.
Like a strutting player, whose conceit
Lies in his hamstring, he doth think it rich
To hear the *wooden* dialogue and sound
'Twi't his stretch'd footing and the scaffoldage. *Shakspeare*.

Clumsy; awkward.
I'll win this lady Margaret: for whom?
Why, for my king: tush, that's a *wooden* thing. *Shakspeare*.

WOODEN, a township of England, in Northumberland, near Alnwick.

WOODEN'S ISLAND, a rocky islet in the North Pacific ocean, on the south coast of King George the Third's Archipelago: so called by Captain Vancouver, from Isaac Wooden, one of his crew, who fell overboard near it and was drowned, a little to the east of Cape Ommaney.

WOOD-END, a hamlet of England, in the parish of Dymock, Gloucestershire.—2. A hamlet in Northamptonshire; 5 miles west-by-north of Towcester.

WOODENDERBY, a parish of England, in Lincolnshire; 3 miles from Horncastle.

WOODFORD, a parish of England, in Essex; $8\frac{1}{2}$ miles north-east of St. Paul's, London. Population 2056.

WOODFORD, a township of England, in Cheshire; 5 miles south-by-west of Stockport.—2. A parish in Dorsetshire; 4 miles from Dorchester.—3. A parish in Northamptonshire; $7\frac{1}{2}$ miles south-south-west of Daventry. Population 653.—4. Another parish in Northamptonshire; $2\frac{1}{2}$ miles south-west of Thrapston. Population 465.—5. A parish in Wiltshire; 4 miles north-north-west of Salisbury. Population 322.

WOODFORD, a township of the United States, in Bennington county, Vermont; 8 miles east of Bennington. Population 254.

WOODFORD, a county of the United States, in the central part of Kentucky, bounded on the north by Scott county, on the east by Fayette, on the south-east by Jessamine, on the south-west by Mercer, and on the north-west by Franklin. It is rich and populous. Population 9659. Slaves 3414. Chief town, Versailles.

WOODFORD-BRIDGE, a hamlet of England, in Essex; 10 miles north-east of St. Paul's, London.

WOODFRETTER, *s.* [*teres*, Lat.] An insect; a woodworm. *Ainsworth*.

WOODGOD, *s.* A pretended sylvan deity.—The wyld *woodgods* arrived in the place. *Spenser*.

WOODGREEN, a village of England, in Southamptonshire, near Fordinbridge.

WOODHALL, a parish of England, in Lincolnshire; 4 miles from Horncastle.—2. A hamlet in Yorkshire; 5 miles north-west of Howden.—3. A township of Yorkshire; $9\frac{1}{2}$ miles south-by-east of Rotherham.

WOODHAM, a hamlet of England, in Buckinghamshire; 8 miles west-north-west of Aylesbury.—2. A township in Durham, near Rushy Ford.

WOODHAM, FERRIS, a parish of England, in Essex; $4\frac{1}{2}$ miles south-south-east of Danbury. Population 747.

WOODHAM, MORTIMER, a parish in the above county; 2 miles south-west of Maldon.

WOODHAM, WALTER, also a parish in Essex; 3 miles west of Maldon.

WOODHAVEN, a small village of Scotland, in Fifeshire, on the Tay, opposite to Dundee, between which there is a regular ferry; 9 miles north of Cupar.

WOODHAY, EAST, a parish of England, in Southamptonshire; $10\frac{1}{2}$ miles north-north-west of Whitchurch. Population 969.

WOODHAY, WEST, a parish of England, in Berkshire; 6 miles south-west of Newbury.

WOODHILL GREEN, a hamlet of England, in Somersetshire.

WOO'DHOLE, *s.* Place where wood is laid up, What should I do? or whither turn? amaz'd, Confounded, to the dark recess I fly, Of *woodhole*. *Philips.*

WOODHORN, a township of England, in Northumberland; 6½ miles from Morpeth.

WOODHOUSE, a township of England, in Leicestershire. Population 893.—2. A hamlet in the parish of Dronfield, Derbyshire.—3. A township in Northumberland, near Alnwick.—4. A hamlet in Staffordshire, near Lichfield.—5. A township in Mayfield parish, Staffordshire.

WOODHOUSE, POINT, a cape on the west coast of King George the Third's Archipelago, which forms the south-east point of Norfolk Sound. Lat. 56. 46. N. long. 224. 50. E.

WOODHURST, a parish of England, in Huntingdonshire, near St. Ives.

WOO'DINESS, *s.* The state of containing much wood. *Mason*.—The vine, which was grown to that bulk and *woodiness*, as to make a statue of Jupiter and columns in Juno's temple. *Evelyn.*

WOO'DLAND, *s.* Woods; ground covered with woods. Here hills and vales, the *woodland* and the plain, Here earth and water seem to strive again. *Pope.*

WOO'DLAND, *adj.* Covered with woods; belonging to woods.—The household beast that us'd the *woodland* grounds. *Dryden.*

By her awak'd, the *woodland* choir
To hail the common god prepares. *Fenton.*

WOODLAND, a parish of England, in Devonshire, near Ashburton.—2. A township in Durham, near Barnard Castle.—3. A hamlet in Gloucestershire; 7 miles north-by-east of Bristol.—4. A township in Lancashire; 8 miles north-west of Ulverston.

WOODLANDS, two townships of England, in Derbyshire, one near Tideswell.—2. A parish in Dorsetshire; 4 miles south-south-west of Cranborne.

WOO'DLARK, *s.* [*galerita arborea*, Latin.] A melodious sort of wild lark.

Where, smit with undissembled pain,
The *woodlark* mourns her absent love. *Shenstone.*

WOODLEIGH, a parish of England, in Devonshire, near Knightsbridge.

WOODLESFORD, a township of England, West Riding of Yorkshire; 6 miles north-north-east of Wakefield.

WOODLEY, a hamlet of England, in Berkshire; 3½ miles east-by-north of Reading.

WOODLOES, a township of England, in Warwickshire; 1½ mile north of Warwick.

WOO'DLOUSE, *s.* An insect. The millepes or *woodlouse* is a small insect; it has only fourteen pair of short legs; it is a very swift runner, but it can occasionally roll itself up into the form of a ball. They are found under old logs of wood or large stones, or between the bark and wood of decayed trees. *Hill.*

There is an insect they call *woodlouse*,
That folds up itself in itself, for a house,
As round as a ball, without head, without tail,
Inclos'd cap-a-pe in a strong coat of mail. *Swift.*

WOO'DLY, *adv.* Madly. *Hufoct.*

WOO'DMAN, or **WOO'DSMAN**, *s.* A sportsman; a hunter.—The duke is a better *woodman* than thou takest him for. *Shakspeare.*

WOODMANCOT, two hamlets of England, in Gloucestershire; one 3 miles from Cheltenham; the other 1 mile from Dursley.

WOODMANCOTE, a parish of England, in Southamptonshire; 8 miles south-west of Basingstoke.—2. A parish in Sussex; 4½ miles north-east of Steyning.

WOODMANSEA, a township of England, East Riding of Yorkshire, near Beverley.

WOODMANSTONE, a parish of England, in Surrey; 4½ miles south-east of Ewell.

WOODMANTOWN, a hamlet of England, in the parish of Woodbury, Devonshire.

WOODMERCOTE, a hamlet of England, in Gloucestershire.

WOO'DMONGER, *s.* A woodseller.—A carman of one Smith, a *woodmonger* in Westminster, found a paper. *Wotton.*

WOO'DNESS, *s.* Anger; rage; madness.

With fell *woodness* he efferced was,
And wilfully him throwing on the gras
Did beat and bounce his head and breast full sore. *Spenser.*

WOODNESSBOROUGH, a parish of England, in Kent, near Sandwich. Population 624.

WOODNEWTON, a parish of England, in Northamptonshire, on the Nen.

WOO'DNIGHTSHADE, *s.* [*solanum sylvaticum*, Lat.] A plant.

WOODNORTON, a parish of England, in Norfolk; 7 miles north-west of Reepham.

WOO'DNOTE, *s.* Wild musick.

Then to the well-trod stage anon,
If Jonson's learned sock be on,
Or sweetest Shakespear, fancy's child,
Warble his native *woodnotes* wild. *Milton.*

WOO'DNYMPH, *s.* A fabled goddess of the woods. Soft she withdrew, and like a *woodnymph* light,
Oread, or Dryad, or of Delia's train,
Betook her to the groves. *Milton.*

By dimpled brook and fountain brim,
The *woodnymphs*, deck'd with daisies trim,
Their merry wakes and pastimes keep. *Milton.*

WOODO'FFERING, *s.* Wood burnt on the altar.—We cast the lots for the *woodoffering*. *Neh.*

WOO'DPECK, or **WOO'DPECKER**, *s.* [*picus martius*, Lat.] A bird.—Nor *woodpecks*, nor the swallow, harbour near. *Addison.*

WOOD-PERRY, a hamlet of England, in Oxfordshire; 5½ miles north-east of Oxford.

WOO'DPIGEON, or *Woodculver*, *s.* A wild pigeon.—If Semiramis be a *wood-pigeon* in Greece, it may perchance have been a house-pigeon in the country of Ashur. *Gregory.* See **COLUMBA PULMUBUS**.

WOODPLUMPTON, a township of England, in Lancashire; 4 miles from Prescott. Population 1397.

WOO'DREVE, *s.* One who has the care of woods. *Used in Kent and Essex.*

WOOD-RISING, a parish of England, in Norfolk; 5½ miles east-north-east of Watton.

WOO'DROOF, *s.* [*asperula*, Lat.] An herb. *Ainsworth.*

WOODROW, a hamlet of England, in the parish of Great Hallingbury, Essex.

WOODS, LAKE OF, a lake of North America, the most northern in the territory of the United States, so called from the large quantities of wood growing on its banks; such as oak, pine, fir, spruce, &c. At the time the French had settlements near it, it was famous for the richness of its banks and waters, which abounded with whatever was necessary to a savage life. But it might be almost concluded, that some fatal circumstance had destroyed the game, as war and the small pox had diminished the inhabitants; the adjacent country having been very unproductive in animals since the British subjects have been engaged in travelling through it; though it now appears to be recovering its former state. There are a few Indian inhabitants on the banks of the lake, who might live very comfortably, if they were not so immoderately fond of spirituous liquors. This lake is of an oval form, 36 miles in circumference, according to Major Pike; and it is thickly studded with islands, some of which are so extensive, that they may be taken for the main land. By its means, the communication is kept up between the lakes Winnipic, Bourbon, and lake Superior. It deserves to be mentioned also, that in the treaty concluded between Great Britain and America, it was fixed upon by the Americans as

the spot from which a line of boundary between the United States and the British territories was to run, until it struck the Mississippi; which, however, can never happen, as the north-west part of the Lake of the Woods is in lat. 49. 37. N. and long. 94. 31. W., and the source of the Mississippi, as explored by Major Pike in 1805, is in lat. 47. 42. 40. N.

WOODSARE, s. The froth called *woodsare*, being like a kind of spittle, is found upon herbs, as lavender and sage. *Bacon.*

WOODSEERE, s. The time when there is no sap in the tree. *Obsolete.*

From May to October leave cropping, for why,
In *woodseere*, whatsoever thou croppest shall die. *Tusser.*

WOODSETTS, a township of England, West Riding of Yorkshire; 11 miles south-west of Bawtry.

WOODSFIELD, a hamlet of England, in Worcester-shire; 5½ miles south-south-west of Worcester.

WOODSFIELD, a post township of the United States, and capital of Monroe county, Ohio; 35 miles north of Marietta.

WOODSFORD, a parish of England, in Dorsetshire; 5½ miles east-by-south of Dorchester.

WOODSIDE, a township of England, in Cumberland; 4 miles from Wigton. Population 527.—2. Another township in the same county; 2 miles from Wigton.—3. A township in Northumberland; 6 miles from Bellingham.—4. A township in Salop; 3 miles south-south-east of Shiff-nall.—5. A hamlet in Westmoreland; 8½ miles north-west of Appleby.

WOODSORREL, s. [*oxys*, Lat.] A plant. *Miller.*

WOODSPEEN, a hamlet of England, in Berkshire; 2 miles from Newbury.

WOODSTOCK, a borough and market town of England, in the county of Oxford. Old Woodstock, in the parish of Wootton, of which one venerable mansion, and a few irregular houses of the inferior order, now only remain, was built in a sheltered situation, on the border of the river Glyanne. New Woodstock, a chapelry to Bladon, is placed on a fine and healthy eminence. The houses are chiefly built of stone, and are in general large and handsome; and the streets are clean and well paved. The town-hall is a handsome stone building, erected about the year 1766, after a design of sir William Chambers, at the sole expense of the duke of Marlborough. Beneath the hall is a piazza, used as a market-place. On the tympanum of a pediment in front of the edifice, are the arms of the noble family of Marlborough. The parish church or chapel is a handsome structure. It originally contained a chantry, founded by king John. The south part of the present structure is a fragment of the ancient foundation; and on this side is a round headed door-case, composed of red stone, and ornamented with chevron work. The northern face of the church was rebuilt about the year 1785: and at the same time a tower was erected at the west end. These alterations have been effected with considerable taste. The tower is of fair proportions, and charged with modest, yet sufficient ornaments. The interior is arranged with decorous and respectable simplicity. The pews are handsome, and a good organ is placed in an appropriate situation. On the more-ancient side three massy columns support pointed arches. In the capitals are introduced various sculptures of the human countenance, all dissimilar, and chiefly tending to a comic effect. On the north, every particular of building is modern, and remarkable for substantial plainness. The tower possesses eight bells, with mellow and pleasing chimes. Adjoining the church is a grammar school, founded and endowed in 1585, by Mr. Cornwell, a native of this place, under a royal licence from queen Elizabeth. The master must be a person in holy orders, and the corporation are trustees. A charitable foundation of a more recent date, likewise claims notice. Near the entrance of the town from Oxford, is a range of almshouses, erected and liberally endowed, in 1793, by Caroline, then duchess of Marlborough, for six poor widows. Woodstock has two manufac-

tures; those of polished steel and gloves; the former very much decayed. The articles of polished steel are entirely made from the old nails of horses' shoes, which are formed into small bars, before applied to the various purposes of delicate workmanship. The lustre of the article thus tediously wrought, is eminently fine, and the polish is restored at a trifling expense, however great the apparent injury committed by rust. The manufacture of leather into gloves, and various other articles, was commenced at Woodstock nearly 60 years back, and has progressively risen in consequence and esteem. About 500 dozen pairs of gloves are now made weekly in the town and the neighbouring villages; and it is supposed that not less than 100 men, and 1500 women and girls, find employment in various branches of the trade. The internal government of Woodstock consists of five aldermen, one of whom is annually chosen mayor; a high steward, a recorder, two chamberlains, and a common clerk; with 15 capital burgesses. The first charter of incorporation was granted by Henry VI. in 1453. This was confirmed, enlarged, or altered, by various succeeding monarchs, the last of whom was Charles II. who granted the charter under which the corporation now acts. A restrictive charter, forced upon the borough in the 2d of James II. was soon after set aside by proclamation; and the charter of Charles restored, which is almost the counterpart of that of New Windsor. It returns two members to parliament, the right of election being in the mayor, aldermen, and freemen of the borough; the number of voters about 160, and the returning officer the mayor. Adjoining the town on the left, is Blenheim-house and park, the magnificent seat of the duke of Marlborough. Here were formerly horse races. Markets on Tuesdays and Fridays, and fairs the 2d Tuesday after 2d February, 5th April, Whit-Tuesday, 2d August, 2d October, Tuesday after 1st November, and the 17th December; 8 miles north-north west of Oxford, and 62½ west-north-west of London. Population about 1500.

WOODSTOCK, a post township of the United States, in Oxford county, Maine.

WOODSTOCK, a post township and village of the United States, and capital of Windsor county, Vermont. The village is pleasant and handsome, situated on the Waterqueechy, containing a court-house, a jail, and a Congregational meeting-house, and it has some trade; 14 miles north-west of Windsor. Population 2672.

WOODSTOCK, a post township of the United States, in Windham county, Connecticut. It consists of three parishes, is a valuable agricultural town, and contains an academy; 6 miles north of Pomfret, and 40 east-north-east of Hartford. Population 2654.

WOODSTOCK, a post town of the United States, and capital of Shenandoah county, Virginia. It is a pleasant town, and contains a handsome stone court-house, a jail, an academy, a market-house, four houses of public worship, one for German Lutherans, one for Presbyterians, one for Episcopalians, one for Methodists, and about 100 houses; 30 miles south-south-west of Winchester.

WOODSTOCK, a post township of the United States, in Ulster county, New York. Here are iron-works, and two glass manufactories; 14 miles north-west of Kingston. Population 950.—2. A post town of Hyde county, North Carolina.

WOODSTONE, a parish of England, in Huntingdonshire; 6 miles north-north-east of Stilton.

WOODSTOWN, a post township of the United States, in Salem county, New Jersey. It contains a Quaker meeting-house, and about 70 houses; 9 miles north-east of Salem, and 26 south-south-west of Philadelphia.

WOODTHORPE, a township of England, in Derbyshire; 6 miles east-north-east of Chesterfield.—2 A hamlet in Leicestershire, 1½ mile south of Loughborough.

WOODTON, or **WOOTTON**, a parish of England, in Norfolk; 11 miles south-south-east of Norwich. Population 379.

WOODVILLE (William, M. D.), was born at Cocker-mouth,

mouth, in the year 1752. Having received a good classical education in his native town, he was placed with a respectable apothecary, to whom he served a short apprenticeship. He afterwards proceeded to Edinburgh, where, after the usual residence, he obtained, in 1775, the degree of M. D., having written and defended a very ingenious thesis "De irritabilitate fibrarum motricium." After passing some time on the continent, he returned and settled near his native place, where he practised his profession five or six years. Dr. Woodville then came to London, and was soon appointed one of the physicians to the Middlesex Dispensary, the duties of which office he discharged in an exemplary manner. In 1790 he published the first part, which was afterwards completed in four quarto volumes, of a highly valuable work, intitled "Medical Botany." In 1791 he was elected physician to the Small-pox Hospital, in the room of the late Dr. Archer; and it may truly be said, that no man ever devoted, more conscientiously or zealously, time and great talents to the promotion of an object, than did Dr. Woodville to improvement in the medical treatment of the patients, as well as in the general government of the establishment. To the officers of the hospital, and those governors who took most interest in its welfare, his merits were well known; and some of the fruits of his genius and industry are before the public in a volume which was published in 1796, intitled "The History of the Small-pox in Great Britain, &c." This work, which it was the author's design to occupy two volumes in 8vo., was well conceived, including a brief history of the disease, and a review of all the publications on the subject of inoculation, with an experimental inquiry into the relative advantages of the various measures that had been recommended. Only the first volume of this work, which is well written, and contains much valuable information, was published, the happy discovery of the efficacy of vaccination having, in the author's opinion, superseded the necessity of the second appearing. Dr. Jenner's grand discovery made a due impression on the mind of Woodville; and as no other man had equal opportunities of witnessing and lamenting the ravages of the small-pox, so no person could be more sincerely anxious and active in the adoption of those means that were found adequate to guard mankind against that pestilence. It is very true, that on the subject of vaccination he was, like every body else, at first sceptical; but he suffered no opportunity to be lost of ascertaining its efficacy, and then of proclaiming his belief in it. Unhappily, in some of his early experiments an error was committed; he was not aware of the influence of the variolous atmosphere of the hospital. The result was, that in certain instances, either pure small-pox matter, or a deteriorated vaccine lymph, had been inserted into the arms of some patients. The effects were faithfully detailed; but being so different from those that had been described by Dr. Jenner, that excellent man and benefactor to the human race visited Dr. Woodville, with whom he argued and remonstrated on the subject. It is to be regretted that some asperities of remark took place between them; although both were equally and honourably engaged in the development of truth. The discussion, however, as is always the case, proved very useful in the dissemination of the new practice; and if Dr. Jenner had reason to find fault with the result of Dr. Woodville's early proceedings, he must have been abundantly gratified by his subsequent experiments and publications. The ample field in which Woodville was placed enabled him to vaccinate great multitudes, some thousands of whom he afterwards tested by variolous inoculation, and thus gave that publicity to vaccination, and that confidence in it, which it could not otherwise have attained in the course of many years. His disease, which terminated in dropsy, had made such gradual advances during the last year of his life, that he frequently talked of his death, which no man ever contemplated with greater equanimity, as likely to take place about a certain assigned period.

He died at the hospital on the 26th of March, 1805; and on the 3d of April, a warm and just eulogium was pronounced over the body in the saloon by his friend Mr. Highmore.

VOL. XXIV. No. 1667.

His parents having been Quakers, he by his own desire was interred in the Friends' burial-ground in Bunhill-fields, after a very appropriate address at the grave by Mrs. Pryor.

WOODVILLE, a hamlet of England, in Kent, adjoining to Dover.

WOODVILLE, a post village of the United States, in Warren county, Tennessee.—2. A post village of Hanover county, Virginia.—3. A post township of Culpeper county, Virginia.—4. A post town and capital of Wilkinson county, Mississippi. The surrounding country is fertile; 37 miles south of Natchez. Lat. 31. 6. N.

WOODWALTON, a parish of England, in Huntingdonshire, near Peterborough.

WOODWARD, *s.* A forester; an overlooker of woods.—A chase or park hath only keepers and *woodwards*. *Howell*.

WOODWARD (John), was born in Derbyshire, in 1664, and, being intended for trade, was apprenticed in London; but in a little while abandoned the shop for the sake of scientific pursuits. In 1687 Dr. Barwick took him into his family, and for the space of four years gave him instruction in medicine and anatomy. He then recommended him to the medical professorship in Gresham college, to which he was elected in 1692. Having directed his particular attention to fossils, with a view to which he had travelled through many districts of England, he published in 1695 "An Essay towards a Natural History of the Earth and terrestrial Bodies, especially Minerals; as also of the Sea, Rivers, and Springs; with an Account of the Universal Deluge, and of the Effects that it had upon the Earth," 8vo. His preparatory knowledge for a work of this kind was very slight, and therefore the execution of it was attacked by Dr. Martin Lister, and others. However, in the imperfect state of geology at that time, his performance engaged notice, and he was chosen in 1693 a fellow of the Royal Society. At this time he was in possession of an ancient iron shield, in the concavity of which was a sculpture representing the story of Camillus and the Gauls at Rome: and as it was a great curiosity among the learned, Dodwell gave an account of it in a Latin treatise, entitled "De Parma equestri Woodwardiana Dissertatio." By this circumstance Woodward was led to increase his acquaintance with a certain class of literati, though he did not escape the ridicule of the wits. In 1695 he was created M. D. by archbishop Tenison, and in 1696 he obtained the same degree from Cambridge; and thus honoured, he was prepared for an admission into the College of Physicians as a fellow in 1702. But pursuing his inquiries into natural history and antiquities, he published some pieces in these departments: *viz.* "Some Thoughts and Experiments concerning Vegetation," communicated to the Royal Society, and printed in the Philosophical Transactions for 1669; "Naturalis Historia Telluris illustrata et aucta; accedit Methodica Fossilium in Classes Distributio," 1714, intended as a grand reply to those who objected to his Natural History of the Earth, which had been translated into Latin by Scheuchzer at Zurich; and "An Account of some Roman Urns, and other Antiquities, lately digged up near Bishopsgate; with brief Reflections upon the ancient and present State of London: in a Letter to sir Christopher Wren." In his medical capacity, he published in 1718 "The State of Physic and of Diseases, &c." 8vo., in which he advanced the notion, that the bile and its salts, re-absorbed into the blood, were the true cause of life and animal motion, and that the same fermenting in the stomach were the cause of diseases; whence he was led to conclude that emetics to evacuate the morbid bile and oily and unguinous medicines to correct it, were universal remedies. This publication produced a controversy with Dr. Friend, in which Woodward was answered both ludicrously and seriously, so that he gained little credit by his medical theory or practice. His chagrin, however, was diverted by the study of fossils, and the augmentation of his cabinet of specimens. He soon after fell into a decline, which terminated his life in his apartments at Gresham college in 1727, at the age of 63. He bequeathed his personal property to the university of Cambridge for the endowment of an annual lectureship, on a subject taken from his own writings

tings in natural history or physic. Soon after his death were published an English edition of his "Method of Fossils," with various additions; and "A Catalogue of Fossils in the Collection of J. Woodward, M. D.," in 2 vols. 8vo., a work of permanent estimation among geologists. In 1737 Dr. Templeman published Woodward's "Select Cases and Consultations in Physic," in which some valuable observations are interspersed. One of his hypotheses was, that the life resides in the blood, and in the separate parts of the body, not in the nerves; in confirmation of which he made many experiments, establishing the *vis insita* of muscles.—*Biog. Brit. Haller. Gen. Biog.*

WOODWORM, *s.* [*coassis*, Lat.] A worm bred in wood.

WOODY, *adj.* Abounding with wood.

Of in glimmering bowers and glades

He met her, and in secret shades

Of woody Ida's inmost grove.

Milton.

Ligneous; consisting of wood.—Herbs are those plants whose stalks are soft, and have nothing woody in them, as grass and hemlock. *Locke.*—Relating to woods; sylvan.—With the woody nymphs when she did play. *Spenser.*

WOODY HEAD, a high cape on the coast of New Zealand, in the South Pacific ocean. Lat. 37. 42. S.

WOODY ISLAND, an island in the Eastern seas. Lat. 1. 46. N. long. 106. 5. E.

WOODY POINT, a cape on the west coast of North America, so named by captain Cook. Lat. 50. N. long. 128. 5. W.

WOODYATES, EAST and WEST, two small hamlets of England, in the parish of Penkridge, Dorsetshire.

WOOPER, *s.* [*pozepe*, Sax. See *To Woo*.] One who courts a woman.

The woopers most are toucht on this ostent,

To whom are dangers great and imminent.

Chapman.

WOOF, *s.* The set of threads that crosses the warp; the weft.—The placing of the tangible parts in length or transverse, as in the warp and the woof of textile, is more inward or more outward. *Bacon.*—Texture; cloth.

A vest of purple flow'd

Iris had dipp'd the woof.

Milton.

WOJEDA, or WAGIDA, the ancient *Guagida*, a town of Tlemsan, in Algiers, forming the frontier towards Morocco; 20 miles west-south-west of Tlemsan.

WOOLINGLY, *adv.* Pleasingly; so as to invite stay.

The temple-haunting martlet does approve,

By his lov'd mansionry, that heaven's breath

Smells wooolingly here.

Shakspeare.

WOOL, *s.* [*pul*, Sax.; *wollen*, Dutch.] The fleece of sheep; that which is woven into cloth.

A gown made of the finest wool

Which from our pretty lambs we pull;

Fair lined slippers for the cold,

With buckles of the purest gold.

Raleigh.

Any short, thick hair.

In the cauldron boil and bake;

Wool of bat and tongue of dog.

Shakspeare.

Sheep's-wool appears to be the product of cultivation; we know of no wild animal which resembles the wool-bearing sheep. The argali, from which all the varieties of sheep are supposed to be derived, is covered with short hair, at the bottom of which, close to the skin, there is a softer hair, or down.

Most ancient writers on wool, and even many moderns, seem not to be aware of any difference in wools, except the fineness or coarseness of the fibre; but the length of the fibre constitutes a far more important distinctive character. Long wool, or what is called combing-wool, differs more from short or clothing wool, in the uses to which it is applied, and the mode of manufacture, than flax from cotton.

Sheep's-wool may, therefore, be divided into two kinds. Short, or clothing-wool, and long or combing-wool: each of these kinds may be subdivided into a variety of sorts ac-

ording to their degrees of fineness. This process is the proper labour of the wool-sorter.

Short wool may vary in length from one to three or four inches; if it be longer it requires to be cut or broken, to prepare it for the further processes of the cloth manufacture. It is always carded or broken upon an instrument with fine short teeth, by which the fibres are opened and spread in every direction, and the fabrics made from it are subjected to the process of felting. By this process, the fibres become matted together, and the texture rendered more compact.

Long wool may vary in length from three to eight or ten inches: it is prepared on a comb or instrument, with rows of long steel teeth, which open the fibres, and arrange them longitudinally: in the thread spun from combed wool, the fibres or filaments of the wool are arranged in the same manner, or similar to those of flax, and the pieces when woven are not subjected to the process of felting.

The shorter combing-wools are principally used for hose, and are spun softer than the longer combing-wools, the former being made into what is called hard worsted yarn, and the latter into soft worsted yarn.

The principal qualities deserving attention in clothing-wools are the regular fineness of the hair or pile, its softness and tendency to felt, the length and soundness of the staple, and the colour. The wool-buyer also regards as important the clean state of the fleece, and to the grower its weight is particularly deserving attention; for in fleeces equally fine, from sheep of the same size, some may be much heavier than others, the fibres of wool being grown closer to each other on the skin.

The fineness of the hair or fibre can only be estimated to any useful purpose, in the woollen manufacture, by the wool-sorter or wool-dealer, accustomed by long habit to discern a minute difference, which is quite imperceptible to common observers, and scarcely appreciable by the most powerful microscopes. We may estimate the thickness of the hair of the finest Spanish and Saxony wool to be not more than the fifteen-hundredth part of an inch, and that of the finest native English to be from twelve to thirteen-hundred parts, whilst the inferior sorts gradually increase to the six-hundredth part of an inch and more. A difference in the size of these fibres, too minute to be noticed by the common observer, may occasion a difference of 40 per cent. or more in the value of the wool. The fineness of the hair has been ever considered as an important quality since the clothing manufacture emerged from its rudest state. Fine wool was formerly valued because a finer thread could be spun from it, and a thinner fabric made, than from the coarser wools; but since recent mechanical improvements have been introduced into the woollen manufacture, it has been found practicable to spin coarse wools to the same length as the finer wools were formerly spun to. It is well known, however, to cloth-manufacturers, that whatever be the fineness of the yarn, unless the wool be fine, it is impossible to make a fine, compact, and even cloth, in which the thread shall be covered with a thick, soft pile; nor would a thin cloth made from coarse wool have the same durability or appearance as one from fine wool of equal weight per yard. Fine wool will, therefore, always preserve a superior value to the coarse; indeed it was long considered as the principal and almost the only quality deserving the attention of the wool-grower, the wool-stapler, and the clothier.

The regular fineness of the fibre is also an object of considerable importance; the lower end of the staple, or that part of the fleece nearest the skin, will sometimes be very fine, and the upper part coarse. In some fine fleeces there will frequently be an intermixture of long, silvery, coarse hairs, and in other fine fleeces an intermixture of short, thick, opaque hairs, called kemps. When the wool is thus irregularly fine or intermixed, it is technically called not being true grown. The fine fleeces of Spain and Portugal, particularly of the latter country, are many of them injured by the intermixture of the long silvery hairs before-mentioned. The Saxony fleeces, from the same breed, removed to colder climates, are generally free from this defect. The coarse

coarse short hairs, or kemps, are not uncommon in some of the fine-woolled flocks of England and Wales, particularly those which are more exposed to the inclemencies of the weather, and have a scanty or irregular supply of food.

On the Merino sheep the fleece is more regular, whatever be the degree of fineness, than on any of our native English fine-woolled breeds.

The best English short native fleeces, such as the fine Norfolk and South Down, are generally divided by the wool-sorter into the following sorts, varying in degree of fineness from each other, which are called, Prime, Choice, Super, Head, Downrights, Seconds, Fine abb, Coarse abb, Livery, Short coarse or breech wool.

Besides these sorts of white clothing wool, two, and generally three sorts of grey wool are made, consisting of flocks which may be black, or intermixed with grey hairs. Some wool-sorters also throw out any remarkably fine locks in the prime, and make a small quantity of a superior sort, which they call picklock. The origin of some of the above names is obscure, but the names of the finer sorts appear to indicate either a progressive improvement in the quality of the wool, or in the art of wool-sorting. The relative value of each sort varies considerably, according to the greater demand for coarse, fine, or middle cloths.

Of fine European wools, the Saxony generally possesses a greater degree of softness than the Spanish, which we believe to be owing to the sheep being less exposed to the action of light and heat. The native fine Italian wool, before the introduction of the Merino race, possessed a considerable degree of softness, judging from wools which we have seen from thence; but they were deficient in soundness, and not true grown. The wools on the chalk soils in the southern and eastern side of England are generally hard, except, as in Kent, where the chalk is covered by thick argillaceous beds. Nottingham forest, Charnwood forest in Leicestershire, and some parts of Shropshire, produced not the finest, but some of the softest wools in England before the late inclosures. The Cheviot hills in Cumberland are not pastured by the finest-woolled English sheep, but their fleeces possess a degree of softness exceeding any from the other districts of England.

The felting property of wool is intimately connected with its softness, the softest wools having the greatest tendency to felt, and the hard wools are all defective in this respect. The felting property appears to depend on a peculiar structure of the surface of the fibres, by which they are disposed to move in one direction more easily than another.

The length and soundness of the staple of clothing wool is the quality next to be considered. By the staple of wool is meant the separate locks into which the fleece naturally divides in the skin, each lock consisting of a certain number of fibres, which collectively are called the staple.

The best length of staple for fine clothing-wool, if found, is from two to three inches. If it be longer it requires breaking down to prepare it for the process of carding. Saxony wool, being generally more tender than the Spanish, and more easily broken down, is sometimes four or five inches long; but as it works down easily, it is preferred, on account of the length of its staple, for such goods which require fine spinning, as cassimeres, pelisse cloth, and shawls. Much of the English clothing-wool of a middle quality is grown longer than is desirable for the purpose of the clothier, and when found is thrown out for the hosiery trade, if the demand for the latter be great. As the grower could not shorten the length of the staple without diminishing the weight of the fleece, he has no motive to induce him to grow shorter wool; but the object might be obtained with much benefit to himself by shearing twice in the year, once the latter end of April, and again the latter end of August; the wool would then be grown of a suitable length for the card, and, from experiments that have been made, we believe the weight would exceed what can be obtained from one clip: the increase would not be less than fifteen per cent., and the condition of the sheep thereby improved.

The soundness of the staple in clothing-wools is not so important as in combing-wools; but for some kinds of colours which injure the wool, it is particularly desirable that the fibre should be sound and strong; this is judged of by drawing out the staple, and pulling it by both ends. The soundness and strength of the staple depend primarily on the healthy state of the animal, and on a sufficient supply of food. The staple on some parts of the fleece will always be more tender than on other parts, but by mixture they tend to form a dense pile on the surface of the cloth.

The colour of the fleece should always approach as much as possible to the purest white, because such wool is not only necessary for cloths dressed white, but for all cloths to be dyed bright colours, for which a clear white ground is required, to give a due degree of richness and lustre.

The cleanness of wool is principally regarded by the purchaser, as it affects the weight. To the grower those fleeces are generally the most profitable that are well filled with the grease, or yolk as it is called, because it keeps the wool in a sound state, and improves its softness. It ought, however, to be washed out as much as possible before it is exposed to sale. The fleeces of the Merino sheep are more plentifully supplied with yolk than those of any of our native fine-woolled breeds; indeed, it is so abundant, that the English mode of washing on the back of the sheep will scarcely produce any effect upon the fleece. It is most copiously produced in those breeds which grow the finest and softest wool, and is always most abundant on those parts of the animal which yield the finest parts of the fleece. This yolk, though so beneficial to the wool in a growing state, becomes injurious to it when shorn; for if the fleeces remain piled in an unwashed state, a fermentation takes place, the yolk becomes hard, and the fibre is rendered hard and brittle. This effect takes place more rapidly in hot weather. The Spaniards remove this yolk in a great measure by washing the wool after it is shorn and sorted. In Saxony fine-woolled sheep of the same race are washed in tubs with warm water, soap-les, and urine, and afterwards in clean water.

In England the wool is washed on the back of the sheep by immersing the animal in water, and squeezing the fleece with the hand. From these different modes of washing, the wool is left more or less pure.

After wool has been washed in the usual manner practised in England, and piled or packed, a certain process takes place in eight or nine weeks, called *sweating*. This is well known to wool-dealers and manufacturers, but has not been before noticed by any writer that we are acquainted with. It is evidently an incipient fermentation of the remaining yolk; and the inner part of the pack or pile becomes sensibly warm. This process produces a certain change in the wool, whereby it becomes in a better condition for manufacturing, being what is called in the north of England less *fuzzy*. This effect results from a diminution of the natural elasticity of the fibre.

When this fermentation takes place in unwashed wool, it proceeds farther, and injures the colour and soundness of the staple or fibre. A similar effect is produced in wool or cloth which has been oiled, and remains some time in an unscoured state. Instances of spontaneous combustion from heaps of refuse wool remaining in a greasy state have been known to occur, and occasion the most serious accidents in woollen factories.

The weight of the fleece is an object of great importance to the grower. It is generally supposed by the English wool-dealers, that an increase of weight implied an increase of coarseness; indeed the words coarse and heavy are considered by them as synonymous; but this is not absolutely the case; a fleece grown upon the same animal may be increased in weight either by the fibres becoming coarser, or by their being grown longer, or by a greater number of fibres being grown in the same skin. To the wool-grower it can never answer to increase the weight of the fleece on small fine-woolled sheep, by growing the wool coarser; if this be his object, the long-woolled breeds of sheep are to be preferred.

ferred. He may produce wool somewhat longer by increasing the quantity of food; but it generally loses something of its fineness, and is less suitable for the cloth trade. He may, however, increase the weight considerably by selecting such breeds as grow the wool close upon the skin, and are thickly covered with wool over every part of the body. In this respect, the Merino sheep have greatly the advantage over any of the native breeds of English sheep; many of them yielding from three to four pounds of pure wool, whilst the finest English fleeces rarely exceed two pounds, and would lose one fourth of this weight when brought to a pure state by scouring. It has been doubted whether all sheep's wool, when clean, possesses the same specific gravity; but, admitting there may be some variation in the wool from different piles, we conceive that it is too minute to deserve the attention of the wool-grower or manufacturer.

Long, or Combing Wool, being prepared for spinning by a process entirely different from that of short or clothing wool, and the pieces made from it being finished in a very different manner, the qualities most required in this kind of wool are length and soundness of the staple, without which the fleece is unsuited for the comb. The fineness of the hair is a secondary quality, required only in certain kinds of goods. The wool-comb is an instrument of simple construction, consisting of a wooden handle, with a transverse piece or head, in which are inserted three rows of long steel teeth. The wool, which is to be combed after being clean scoured, dried, and oiled, is first drawn upon these teeth with the hand, until the comb is sufficiently loaded. It is then placed on the knee of the comber, and another comb of a similar kind is drawn through it, and the operation is repeated till all the hairs or fibres are combed smooth in one direction. This operation requires considerable strength, but the comb being previously heated, and the wool thoroughly oiled, facilitates the process. When completed, the combed wool is drawn off with the fingers, forming what is called a sliver; the shorter part of the wool sticks in the teeth of the comb, and is called the noyl: this is sold to the clothiers.

From the above description, it is evident that if the staple of the wool be not sound, the greater part of it will be broken by the process of combing, and form noyls. The staple must also have a sufficient degree of length for the combs to operate upon it. Length and soundness of the staple are therefore the most essential and characteristic qualities of combing-wools.

Long wools may be classed into two kinds: first, those suited for the manufacture of hard yarn for worsted pieces; and second, those suited for the manufacture of soft yarn used for hosiery. The former require a greater length of staple than the latter. The first may therefore be called long combing-wool, and the latter short combing-wool; between these there are gradations of wool, which may be applied to either purpose.

Long combing-wool should have the staple from six inches to eight, ten, or even twelve, in length. Before the recent improvements in spinning by machinery, a very great length of staple was considered as an excellence in long combing-wools; and on this account the hog-wool, or the first fleeces from sheep which had not been shorn when lambs, was more valuable than the wether wool from the same flock, and bore a higher price than the latter, by at least fifteen per cent. Since that time, the wether wool has risen in relative value on account of the evenness of the staple, each lock being nearly equally thick at both ends; but the staple of hog-wool is pointed, or what is technically called spirey. Eight inches, if the wool be sound, may be regarded as a very proper length for heavy combing-wools. The longer stapled wool was formerly worked by itself, and used for the finer spun yarn, or mixed in small quantities with the wether wool, to improve the spinning. It is found, that an equal length of staple contributes to the evenness of the thread when spun by machinery, and a very great length of staple is rather injurious than otherwise in the process of machine spinning. To the wool-grower, however, it must always be

desirable to increase the length of his heavy combing fleeces, as he thereby materially increases the weight; and we have not yet learned that the price has ever been reduced on this account, for if the wool be too long for some branches of the worsted manufacture, there are others in which it may be worked with advantage.

The length of the staple may be increased by a plentiful supply of nutritious food. The same effect may also be produced by letting the wool remain a longer time on the sheep before it is shorn. We have seen a staple of Lincolnshire wool which was twenty inches in length: it had grown two years without shearing. This, however, would be unattended with any advantage to the grower. Length of staple in wool depends primarily on the breed, but may be more affected by culture than many other qualities of the fleece. The soundness of the staple may be easily judged of by pulling both ends of it with the fingers with considerable force. In weak or unsound wool, the staple easily breaks in one or more parts, and on observing it, it will be seen that the fibres are much thinner in the part which breaks. This is occasioned either by a deficient supply of food, by disease, or by inclement seasons, which cause a stoppage in the growth of the fleece. In some instances the stoppage has been so entire that the upper part of the staple is nearly separated from the lower, and is only connected with it by a few filaments: in such cases, the stoppage has continued for a considerable time, and the bottom part of the staple may be considered as a new fleece, protruding the old one from the skin. Connected with the soundness of wool, there is another property required; this is, that the staple be free and open, or that the fibres shall not be matted or felted together; an effect which takes place frequently when the wool is unsound. It is, in fact, a natural felting of the wool on the back of the animal, when by any cause it has ceased to grow. Sometimes the lower part of the fleece next the skin will be so completely matted as to form a substance nearly as hard as a hat, and will hold to the skin by a few hairs only. These are called cotted fleeces; all approach to this state is peculiarly injurious to combing-wools. The wool-buyers generally throw out the cotted and unsound fleeces when they pack the wool from the grower, and buy them at a very reduced price. The softness of combing-wool, though of less importance than in clothing-wool, yet enhances its value, as it is found that such wool makes a closer and softer thread, and in every process of the manufacture finishes more kindly. Combing-wools grown on light calcareous soils are deficient in this respect; such are the combing-wools of Oxfordshire and the Cotswold hills, which are formed of that species of lime-stone called oolite, or roe-stone. A copious supply of the yolk is necessary to the healthy condition of the fleece, and as this in many flocks is nearly equal in weight to the wool, the fleeces contain from six to eight pounds or more of it before they are washed, for in the unwashed state they often weigh eighteen pounds in many of the long-woolled flocks in Lincolnshire.

The whiteness of the fleece is less important in the combing than in clothing wool, provided it be free from grey hairs. The latter circumstance does not frequently occur in combing-wools. There is, however, a peculiar colour communicated by the soil, which is sometimes so deep as to injure the wool for particular uses, and what is of more importance, there is a dingy-brown colour given to the fleece by impoverished keeping or disease, which is called a winter stain; it is a sure indication that the wool is not in a thoroughly sound state, and such fleeces are carefully thrown out by the wool-sorter, being only suited for those goods which are to be dyed dark colours.

The fineness of heavy combing-wool is of less importance than the other qualities. In every fleece of this kind there will be a certain small portion of short clothing-wool on the shanks, the belly, and the throat. The clothing-wool from such fleeces is not often divided into more than two or three low sorts, and the combing-wool is seldom thrown into more than four sorts, that is, two sorts of the hog-wool, and two

sorts of the wether-wool, of which three-fourths, if the fleece be good, will form the best sort in each.

There is, however, a fine long combing-wool which is required for bombazines and the finer kinds of worsted goods; this is most frequently selected from the longer parts of clothing fleeces, and admits a division into four or five sorts, the finest being equal in hair to that of the head or super in clothing-wool; whereas the best sort of the common heavy combing-wools seldom ranges higher in point of fineness than the coarsest sort of clothing-wool above the breech locks; viz., the low abb and the livery.

Short combing or hosiery wool requires a different length of staple, according to its fineness: for the better sorts, the staple should not be shorter than four or five inches; the lower sorts may range as high as eight inches. A greater length than this is not desirable for any kind of soft worsted. What has been said of the soundness and fineness of staple required for long combing-wool, applies equally to the hosiery wool, but in this the fineness of the hair and softness are of more importance. Most of the fleeces which yield fine combing-wool, produce nearly an equal quantity of short wool, which is thrown in the same manner as the regular clothing sorts. The combing sorts for the hosiery are generally called:—Super matching, fine matching, fine drawing, altered drawing, brown drawing, saycast.

The names of these sorts probably derive their origin from ancient processes of the manufacture.

Most of the best sorters throw out the hog combing-wool from the best sorts, making a superfine hog for the bombazine trade, hog-wool being less suitable for the hosiery, which does not require yarn so finely spun as for hard yarn.

As all the different sorts of short combing-wool, together with several sorts of clothing-wool, will frequently occur in one English fleece, it is obviously the interest of the grower that his fleece should produce as great a proportion of the best sorts as can be done without materially diminishing the weight.

The origin of the woollen manufacture, like that of many other useful arts, is not precisely known. At a very early period, domestic sheep were extensively spread over Western Asia. The introduction of sheep into Europe is not recorded by ancient writers, unless we suppose the expedition of the Argonauts to Colchis refers to this event. Sheep were probably first domesticated for their milk, and afterwards for their skins, which must have been the first dress of pastoral nations. Sheep and goats, in the early ages of society, were nearly of equal value. The Greeks, who ostentatiously refer all useful discoveries to their own country, and rank their inventors among the gods, have ascribed to Minerva the invention of spinning and weaving. These arts appear, however, to have been first practised, at a very early period, in Egypt, and applied to the spinning and weaving of flax. At what time they were first applied to wool is unknown. Though Pliny informs us, that Nicias of Megara discovered the art of fulling cloth, the property which wool possessed of felting was known in the East at a much earlier period, and probably gave rise to the first manufacture of woollen goods which were not woven, but felted like the substance of hats.

Whilst the skins of sheep dressed with their wool on served as clothing, it is obvious that only one useful fleece could be obtained from one animal, and as the fleece is generally cast, or falls off once a year, this produce must have been wasted. In a very early period, it was found that by pressure and moisture the fibres of wool might be made to adhere together, and produce a compact pliable substance, quite as durable and more convenient than the skins formerly used. This appears to have been the first effort to produce a woollen manufacture. It is probable the felting property was discovered by accident, as some fleeces will felt upon the sheep's backs; among farmers, these are called cotted fleeces. When the application of this discovery was first made, the knowledge of the art was soon widely spread. The tents of the Arabs and Tartars are, at the present day, all made of felt from the wool of sheep, mingled with the hair of goats, camels, and other quadrupeds, and may be considered as remains of the original art of cloth-making.

VOL. XXIV. No. 1668.

The art of spinning and weaving threads made from wool was, in all probability, derived from the east; they are alluded to by Moses as existing nearly fifteen hundred years before the Christian era.

Thus, in addition to the superior pliability and comfort of woollen cloth, compared with skins or felts, the taste for it must have been widely spread by the art of dyeing. It had also the great recommendation to its general adoption, that it could be fabricated with ease in every family. The machinery required for the purpose was extremely simple. The distaff and the loom were little more in the hands of the first manufacturers, than the spade in those of the husbandman. The manner in which spinning and weaving were performed, is not related until about the third century. Then the loom consisted of a frame of wood, in some respect different from the modern one, but well adapted to the same purposes.

The alterations which have been made in it consist, perhaps, more in the position of the beam, and the mode of opening the web for the passage of the shuttle, than in any other circumstance. Nor was the earliest mode of spinning less perfect, than that which was practised in the most celebrated manufacturing countries for many ages afterwards. It was performed by means of a rod or staff, about which the wool to be spun was carefully wrapt, and held in the left-hand, while a rough kind of spindle, quickly twirled betwixt the right-hand and the thigh, was suffered to continue its motion when suspended by the thread which the artist gradually lengthened with his fingers. This least complex of spinning-machines is not entirely laid aside even now. A few years since it was not uncommon in the county of Norfolk, and its continuance in use through so many ages is the best proof of its excellence.

We have little information respecting the woollen manufactures of the Greeks and Romans, as distinct from their domestic manufactures; but large establishments were necessary for the clothing of distant armies, and for foreign commerce. That the Romans had carried the manufacture of fine woollen cloth to a high degree of perfection, is proved by a variety of circumstances, and particularly by the great attention paid to the cultivation of fine-woolled sheep, and by the high prices at which the wool and sheep were sold, as appears from the writings of Pliny, Varro, and Columella. Pliny describes two kinds of sheep: the one which grew coarse long wool, and was on this account called *hirtum* or *hirsutum*, and from its hardness and ruder treatment *colonicum* or rustic; the other breed was called *molle*, from the softness of the wool, and *generosum* or noble, from its excellence; also *pellitum*, from its being clothed with skins to protect the wool. The race is sometimes also called Tarentinum, Apulum, Calabrum Atticum, and Græcum, from the neighbourhood or district in which it chiefly lived; but what is of more importance, as shewing the origin of the fine-woolled sheep of Italy, the race is called Asianum; and, according to Pliny, a similar race existed in his time at Laodicea in Syria. The description given of these sheep by Pliny, agrees with the present race of Merino sheep.

That the Romans imported their Tarentine sheep into their western colonies, with the art of manufacturing fine cloth, we learn from Strabo and Pliny. The former writer, who flourished in the reign of Augustus, says, that in Turdetania, in Portugal, then a part of Spain, "they formerly imported many garments, but now their wool was better than that of the Coraxi, and so beautiful, that a ram for the purpose of breeding was sold for a talent, and that fabrics of extraordinary thinness were made of this wool by the Saltrata." Probably this was similar to the shawl cloth of India, and woven in the same manner, as Pliny calls it *scutulatus*, a term which he applies also to the spider's web. The little attic talent of silver is estimated to equal in value 216*l.* of English money, which shews the high estimation in which the best wool was held even in the colonies of Rome.

All ranks of people of both sexes among the Romans, chiefly wore woollen garments. In the reign of Aurelian,

270 years after Christ, a pound of silk, according to Vopiscus, was equal to a pound of gold. A people so pre-eminent in wealth, and in all the refinements of art, would naturally be solicitous to attain the highest degree of excellence in the manufacture of those fabrics which were calculated to gratify their passion for adorning their persons, and it was equally as necessary to consult their ease as their vanity. The summer-heat of Italy was so great, that the affluent could scarcely have supported a woollen dress, had it not been made of the lightest and thinnest cloth. We find also, that during the Augustan age, and for a considerable time afterwards, it was the fashion to wear cloths which, as at present, were furnished with a raised nap or pile. Such cloths were called *peæ*, in contradistinction to *trita* or thread-bare. Thus Horace:

“ ——— Si forte subucula *peæ*
Trita subest tunicæ — rides.”

“ You laugh if you espy a thread-bare vest
Under a well-dressed tunic.”

And also Martial:

“ *Pexatus pulchre, rides mea, Zoile trita.*”

When in the decline of the Roman empire, their colonies were overrun by savage barbarians, all their public establishments and manufactures were destroyed, but the art of producing from the fleece a warm and substantial clothing was never entirely lost, even during the darkest days of ignorance. It began to revive, and became the separate occupation of one class of the community about the middle of the tenth century in the Low Countries, where it remained the glory of the people, and the source of their opulence, through more than four hundred years. The wool which it consumed for the first few years was the produce of their own pastures, which had but lately been reclaimed from the forest; but as the manufacture extended itself, the demands became larger, and were supplied from a greater distance. The wealth which it distributed was soon visible, and people crowded into the country, engaged in its commerce, and pushed their speculations with increasing vigour through a hundred and fifty years, when an inundation of the sea threatened to involve the art, the artist, and the country, in one general destruction. The dispersion of the people who fled from the calamity which appeared to overwhelm their hopes, instead of destroying the infant manufacture, gave it additional vigour, and was the means of establishing a connection between the Netherlands and foreign countries, which proved of the highest importance to commerce. It contributed to a much more speedy recovery of the arts connected with the woollen manufacture, from the ruin which seemed to threaten them, and gave a striking instance of their partiality for the seats where they have once flourished, under the patronage of a government liberal enough to encourage, and sufficiently powerful to protect them, even in situations attended with natural disadvantages. The influence of these manufactures upon the fleeces of the Low Countries must have been very considerable; for before the year 960 we have no reason to suppose that their quality was superior to that which we find in the neighbouring districts; yet it was not very long ere Flanders and Brabant became famous for the manufacture of fine cloths, even at a period when they imported but little foreign wool. Perhaps the fabrics might not be equal to those which we now produce from the fleeces of Spain, or even from the improved ones of our own sheep, but they were preferable to those of England and the nations of the continent, Italy and Spain excepted. It was about the year 1200 that the merchants began to import the wools of other countries, to extend their connections much more widely, and to grow by this means still more rich and powerful. The manufactures required a larger quantity of the raw material than usual, and the population of the country had reached that extent which does not admit of a great number of sheep being kept. The operation of these two causes was evidently sufficient to induce the manufacturer to go farther from home, and to seek the most convenient methods of supplying his

looms. It might have been expected that he would have turned his attention to France and to Germany; but independent of the hostile dispositions of some of the neighbouring sovereigns, the raw material was too bulky to be conveyed at an easy expense through the bad roads of a half cultivated country; and the ships of Spain and of Britain, who found an interest in supplying the wants of the Netherlands, unladed their cargoes almost at his very door, and solicited in payment but little else than the goods which he had manufactured.

Spain was the first country on the western side of Europe, where the Tarentine breed of fine-woolled sheep were cultivated with success by the Romans.

This breed, intermixed with the native flocks, gave rise to the present fine-woolled sheep of Spain; and it does not appear that this valuable race was ever greatly neglected in that country. That it abounded in sheep in what is called the middle age cannot be doubted. At the period when the Saracens extended themselves in Spain, about the eighth century, to use the quaint words of Roderic, archbishop of Toledo, “it was fruitful in corn, pleasant in fruits, delicious in fishes, savoury in milk, clamorous in hunting, and gluttonous in herds and flocks,”—*gulosa armentis et gregibus*. He wrote in A. D. 1243. In England at that time sheep were so scarce, that a fleece was estimated at two-thirds the value of the ewe which produced it, together with the lamb.

Into Spain the invaders either carried the arts of luxury, or, what is more probable, improved them by their superior industry. The revenue of one of their sovereigns in the tenth century amounted to six millions sterling; a sum, says Gibbon, which at that time probably surpassed the united revenues of the Christian monarchs. When, several centuries afterwards, the Saracens were gradually expelled by their Christian neighbours, Spain saw nothing but the change of religion to compensate the loss of population, of agricultural and mechanical science, of industry and wealth. On the recovery of Seville from the Moors in 1248, not less than 16,000 looms are said to have been found in that city. Of these, the greater number was probably employed in the fabric of woollen cloths. According to Ustarix, “Theory and Practice of Commerce,” the manufactures of Segovia flourished most, both in point of number and quality, and were in high esteem, being the best and finest that were known in ancient times.

We are told by Dillon, in his “History of Peter the Cruel,” that the woollen cloths of Barcelona were in high esteem in Seville in the reign of that prince, and in the preceding century. So far back as 1243, the woollen cloth of Lerida is spoken of in terms of great estimation. A few years after, Baulas, Valis, Gerena, Perpignan, and Tortosa, were remarkable as manufacturing towns, and for the fineness of their cloths, fustians, and serges. So great was their exportation, that in 1353 there were 935 bales of cloth taken on board a ship from Barcelona to Alexandria by a Genoese privateer; and 1000 bales of cloth were taken on board three Catalonian ships in 1412, by Antonio Dorco, in the port of Callus.

According to Lucius Marineus Siculus, who wrote in the time of the emperor Charles V., Spain was then full of herds and flocks, and not only supplied its own people most abundantly, but also foreign nations, with the very softest wool.

Damianus a Goes, who was page to Emanuel, king of Portugal, in 1516, says, that there are annually exported from Spain to Bruges 40,000 sacks of wool, each selling at the lowest for twenty gold ducats.

The superfine wools of Spain seem to have been first introduced among the Italian states. Thus Damianus a Goes in 1541, after having specified the 40,000 sacks to Bruges, as before-mentioned, adds, “and also to Italy, and other cities of the Netherlands, are annually sent about 20,000 sacks, of which those used in Italy, being of the choicest wool, are sold at from forty to fifty gold ducats each.”

Next in order of time to the Italians, the manufacture of superfine wool seems to have been adopted by the French who,

who, according to Guicciardini, in 1560 sent by land to Antwerp some very fine cloths of Paris and Rouen, which were highly prized.

A strong confirmation of the early use of the best Spanish wool, unmix'd with coarser by the Italian states, is furnished by Richelieu's Political Testament, printed in 1635, in which, speaking of the fine woollen manufactures of France, the author says, "the Turks prefer the draps de sçeau de Rouen to all others, next to those of Venice, which are made of Spanish wool."

A treaty between France and Spain in 1659, enabled the former freely to obtain the wool of the latter, and thus to gain great advantage over us in the Levant trade. From the proximity of France to the woollen manufactures in the north of Spain, it might have been expected that the French would have earlier engaged in this manufacture; but owing to their frequent northern wars, and their attention being directed to the manufacture of silk, the French do not appear to have commenced the fabrication of woollens for exportation extensively before the 16th century. About this time, France made great progress in her manufactures of wool, and in securing the export trade, particularly that to Tartary for which she was better situated than Holland or England.

The nature of her trade to warm climates directed her attention to the fabrication of finer and lighter cloths, than those made by her northern neighbours; in consequence of which she preserved the greater part of the Turkey trade to the period of the French revolution, and in general fine French cloths had attained a celebrity for their superiority, both in texture and dye, over those of any other country in Europe. The native breeds of sheep in France were greatly improved by intermixture with sheep imported from Spain. With these advantages, France might have nearly secured a monopoly of the finer branches of the woollen manufacture, had not the absurd policy of her rulers, in the revocation of the edict of Nantz, driven the manufacturing Protestants to other countries, where they contributed, by their exertion, their skill, connections, and capital, to form establishments which rivalled those of the country from which they were expelled.

Notwithstanding this, as France supplied the greater part of her own population of twenty millions with cloth, besides her foreign exports, we conceive that the woollens manufactured in that country, before the late revolution, equalled in quantity the cloth made in England at the time, and greatly exceeded it in value. Under the emperor Napoleon, the best Merino flocks were imported in multitudes from Spain, which have spread over the country, and are equal to supply extensively her manufactures of woollens, when they shall be again fully established. Considerable quantities of fine wool have been imported from France into England since the peace of 1815.

The confusion attendant on a great revolution, continued for twenty years, gave so severe a blow to the manufacturing establishments of France, that a considerable time must elapse before they are completely established. Prior to this revolution, the superfine cloths of France were superior to those of England, in texture, colours, and softness. In the finer articles of worsted goods, and in the mixed worsted goods made partly with long combing-wool, and partly with silk or goat's wool from the Levant, they surpassed the manufactures of this country; but the manufacturers of the commoner kinds of worsted goods, as tammies and shalloons, could not rival us in foreign markets for want of a proper supply of wool suited to the purpose. The following were the principal seats of the superfine and fine woollen manufactures in France, arranged according to the different qualities of the goods made at each, beginning with the finest: 1. The manufactures of Gobelins.—2. Of Sedan.—3. Of Abbeville.—4. Of Louviers.—5. Of Elbœuf.—6. Of Rouen and Darnetal. Besides several detached manufacturing establishments of superfine cloth in Languedoc, Champagne, and other parts of France.

At the Gobelins, superfine cloths of the very first quality

were manufactured; but the manufactures there were confined solely to the broadest white cloth intended to be dyed scarlet or purple, and the brightest colours from cochineal.

Sedan followed next to Gobelins for the beauty of its superfine cloths, where they were also made of various breadths and colours.

Abbeville may be placed next after Sedan: some have even supposed that it equalled Sedan in the fineness of its cloths; but this arose from the cloths of the latter place being of various sorts: the lower kinds were certainly inferior to those of Abbeville; but the quality of the greater part of the cloths of Sedan were of a better kind than the average quality of the cloths of Abbeville. In the manufactures of Sedan, each manufacturer confined himself to a particular kind of cloth, for which he became distinguished, some being celebrated for fine, and others for superfine cloths exclusively; whereas in Abbeville, Louviers, and the other districts enumerated, there were manufacturers who made various sorts, and the proportion of the fine to the superfine was greater than at Sedan.

Elbœuf was one of the most ancient seats of the woollen manufacture in France, but the quality of the cloths made there had greatly degenerated from the years 1760 to 1770; but afterwards the manufacturers returned to the former quality of their cloths, which were partly made of the fine wools from Berry, and partly from fine Spanish wool, or from a mixture of Spanish with the best wools of Berry.

Rouen and Darnetal may be placed in the sixth class of manufacturing districts of fine cloth, in which the finest wools of France were principally used, mixed with those of Spain.

The establishments for the manufacture of common cloth and coarse woollens were much more widely spread over France. The goods appear to have been principally consumed in that country to supply the demand of a population of twenty millions, and the numerous military establishments, besides what might be sent to the French colonies.

As the French never exported any considerable quantity of common or coarse woollen cloths, the manufactures of these articles never equalled in extent those of England. The circumstance of the coarse cloth manufacture being so widely spread over the country, tended also to prevent that degree of rivalry which promotes the spirit of improvement where manufactures are more concentrated; add to this, the French had not that abundant supply of the coarser clothing-wools which could enable them to rival us in the export of heavy woollen goods.

The worsted manufactures of France, including serges and those goods made with a warp of worsted, were principally carried on in four of the provinces of France, but more extensively in Picardy than elsewhere. The long combing-wools which supplied this manufacture, were partly the produce of France, and partly imported from Holland, England, Flanders, and Germany. M. Rolland, in the French Encyclopædia, describing the French manufactures in the year 1783, soon after the American war, says, that during that war the English administration tacitly encouraged the exportation of wool to promote the interests of agriculture. He describes the French combing-wool as being coarser and more harsh than the wool of Holland, as wasting much more in the manufacture, and making goods of a very inferior quality. The combing-wools of England, though generally less sound and fine, and of a less pure white, than those of Holland, were particularly well suited to some parts of the worsted manufacture.

The combing-wools from Germany were coarse and harsh, and only used in default of other supplies. Very fine worsted yarn was also obtained from Saxony and the environs of Gottingen; but this yarn was tender, and required to be mixed with worsted yarn from English or Dutch wool. The yarn of Turcoign was supposed to be Dutch, but was principally from Flanders and Artois. The goat's wool came from the Levant, by way of Marseilles, in bales of from 200 to 300 lbs. It sold from four livres to twelve livres *per* French pound;

pound; the price of that most generally used was about 4 livres 10 sous *per* pound. The silks used in silk camelots, &c. were obtained from Paris and Lyons.

The following table gives the quantity and value of wool yarns, and worsted pieces in Picardy; but he supposes the quantity to be under the real amount, the manufacturers concealing the extent of their trade to avoid arbitrary taxation.

Wool consumed in the Worsted Manufactures of Picardy.

	sous.	livres.
French wool	3200000 at 22	3520000
Dutch ditto	180000 at 40	360000
English ditto	200000 at 32	320000
German ditto	100000 at 22	110000

3680000 4310000

Yarn imported.

	liv. s.	
Yarn of Turcoign	60000 at 8 10	510000
German yarn	100000 at 7 0	700000
Levant yarn, or mohair	220000 at 5 10	1210000
Silk used in fine worsted goods	20000 at 35 0	700000

Total value of wool and yarn	- - -	7430000
Combing and spinning 3680000 lbs. of wool	- - -	4310000
Winding, warping, and weaving	- - -	4770000
Dyeing of yarn and pieces	- - -	190000
Profit of the wool-dealers, manufacturers	- - -	1300000

Total value of 150000 pieces coming from the manufacturer	- - - - -	18000000
Value of dyeing-wares	- - - - -	500000
To which carriage and profit of the merchant and draper	- - - - -	2000000

Total value of worsted goods in Picardy 20500000

One million and fifty thousand pounds weight of wool were also consumed in hosiery in the same province, of which the greatest part was native; and the remainder about two hundred and fifty thousand pounds weight from Holland. The number of working manufacturers in Picardy is thus stated:

50000 men who gain 140 livres <i>per annum</i>	7000000
50000 women	3500000
150000 children	6000000

The greater part of the manufacturers resided in the country, and were employed part of the time in agriculture; this was also the case with the manufacturers in the towns, so that not more than eight months in the year were devoted to manufactures. This change of employment, so conducive to the health and comfort of the labouring classes, may be regarded as presenting the happiest form under which manufactures can be carried on. This was also in a considerable degree the situation of the woollen and worsted manufactures in Yorkshire, before the late introduction of machinery had driven the population into large factories; a change which may be regarded as one of the greatest evils that ever afflicted civilized society, tending directly to degrade and enfeeble the human race, and to render man a wretched machine, a prisoner from the cradle to the workhouse or the grave, devoid of moral feeling and physical energy.

What was the extent of the worsted manufacture in the other provinces of France where it was carried on, we have no correct means of ascertaining. In the middle of the last century, the export of cloths and worsted goods from Languedoc alone amounted annually to about 60,000 pieces, sent to the Levant and to Barbary. At that time also, Spain, and all the countries bordering the Mediterranean, received worsted goods from France. In the variety of worsted articles, in the ingenuity of the patterns, and the superiority of the workmanship, as well as of the dyes, France may be regarded as having surpassed any other nation

in Europe, prior to the year 1780, or about the close of the American revolution. Since that period, the manufactures of England have astonishingly increased, and have obtained a decided preference in foreign markets.

The woollen manufactures of Saxony and Germany have been long established; the fugitives from the edict of Nantz contributed much to improve and extend them. During the late war all the manufactures in Germany and every part of the European continent suffered greatly, but are at present rapidly reviving, and will abridge the amount of our exports in Europe.

In Russia, Sweden, and Denmark, the woollen manufacture, as a distinct occupation, is comparatively new; yet it has existed long enough to produce great alteration in their flocks. And as this change was attempted in a more enlightened period, and conducted by scientific men, the best means were adapted to promote the improvement, and new breeds of sheep have been introduced into both countries. The same remark applies to Saxony and other circles of the German states, and even Hungarian flocks are not without evident indication of a change for the better.

Of the worsted manufacture as distinct from the woollen, we have little information respecting its origin. It comprises all those goods made of combed wool, in distinction from carded wool. We are unacquainted with the period when the wool-comb was invented, or when worsted goods were first manufactured. It is probable, that worsted goods were originally woven in the East, and that the knowledge of them was brought into Europe either by the Armenian merchants, or those who returned from the extravagant expeditions which were undertaken for the recovery of the Holy Land from the dominion of the infidels. The garments which are now worn by the Turks, some of which seem to have been produced by means of the comb, the incidental mention of that instrument in an account which we have of Angora, and the demand for worsted goods through the Levant, confirm the conjecture, and lead us to suppose, that there exist very considerable manufactures of this kind in the Turkish empire, although we know little more of its domestic and rural condition, than can be obtained from the most vague accounts and uncertain deductions. After the art of spinning worsted yarn was known in the west of Europe, the looms of the Netherlands became active in converting it into those peculiar kinds of goods to which it was adapted, and it seems as though the distinction between these and woollen articles was not generally noticed until some years afterwards. It might have been expected from the nature of the article, that the manufacture of worsted goods should in many southern countries have preceded that of cloth. Long-stapled wool suited to the comb seems more spontaneously the produce of uncultivated sheep, than short wool, which is to be manufactured by carding, and its mode of manufacture more nearly resembles that of flax; hence it is not improbable, that worsted goods were made in Egypt and the East before the manufacture of woollen cloth. This is, however, uncertain.

In the manufacture of long wool, the fibres are arranged parallel to each other, like those of flax; but before they are spun, they require to be laid even by some kind of instrument, which shall separate the fibres, that they may draw out easily in spinning. A comb of a very simple construction, with a few wires for the teeth, was probably first made use of. It was afterwards found, that the application of heat to the comb contributed more effectually to the regular arrangement of the fibres; and thus the invention of the common wool-comb arose, but at what period is unknown. Vulgar tradition ascribes the invention to bishop Blaize, who first used it in Alderney; but there does not appear any authority in support of this opinion. The bishop lived in Armenia, and was raised to the episcopal dignity about the time of Dioclesian, and suffered martyrdom under that tyrant. Before he was beheaded, he was tortured with iron combs, with which his flesh was torn; and hence when an instrument of that kind was brought into common use, the workmen

men chose him for their patron saint. The traditions of the origin and progress of the worsted manufacture are thus extremely imperfect; we shall have occasion to speak of its introduction and progress in this country in the following section.

Rise and Progress of the Woollen Manufactures in England.—The Romans, as we have stated, had a cloth manufacture at Winchester. The first account of any distinct body of manufacturers afterwards occurs in the reign of Henry I., but either the people of this country were wholly clothed in skins or leather in the intervening space, or, what is more probable, coarse cloths were manufactured in a rude manner in most of the towns and villages in England. A great part, however, of the dress of the labouring classes in the country was made of leather, particularly the breeches and waistcoats, even till the last reign. George Fox, the founder of the Quakers, in the reign of Charles I., travelled on his missions through the country, buttoned up in a leather doublet, or waistcoat with sleeves, which supplied the place of a coat. This was not, as his adversaries afterwards affirmed, from any superstitious prejudice respecting that costume; it was the common dress of the labouring mechanics at that time, to which class he belonged.

The first account of any foreign weavers settled in England is recorded by William of Malmesbury and Giraldus Cambrensis, who relate that a number of Flemings were driven out of their own country, by an extraordinary encroachment of the sea in the time of William the Conqueror. They were well received, and first placed in the neighbourhood of Carlisle, and on the northern frontier; but not agreeing with the inhabitants, they were transplanted by Henry I. into Pembrokeshire. They are said to have been skilful in the woollen manufacture, and are supposed to have first introduced it into England as a separate trade. Cloth-weavers are mentioned in the exchequer accounts as existing in various parts of England in the reign of Henry I., particularly at London and Oxford. The weavers of Lincoln and Huntingdon are represented as paying fines for their guild in the 5th of Stephen; and in the reign of Henry II. (1189), there were weavers in Oxford, York, Nottingham, Huntingdon, Lincoln, and Winchester, who all paid fines to the king, for the privilege of carrying on their trade. (*Chronicon Pretiosum*, p. 64.) There were also cloth dealers in various parts of Yorkshire, Norwich, Huntingdon, Gloucester, Northampton, Nottingham, and Newcastle-upon-Tyne; also several towns in Lincolnshire, and at St. Alban's, Baldock, Berkhamstead, and Chesterfield, who paid fines to the king that they might freely buy and sell dyed cloths. These are supposed to have been cloths imported from the Flemings. The red, scarlet, and green cloths, enumerated among the articles in the wardrobe of Henry II., were most probably foreign, as the English had attained little skill at that time in the art of dyeing.—*Madox's History of the Exchequer*.

In the 31st of Henry II., the weavers of London received a confirmation of their guild, with all the privileges they enjoyed in the reign of Henry I.; and in the patent he directed, that if any weaver mixed Spanish wool with English in making cloth, the chief magistrate should seize and burn it.—*Stowe's Survey of London*.

In the reign of Henry III., an act was passed limiting the breadth of broad-cloths, russets, &c. to two yards within the lists. In the year 1284, foreign merchants were first permitted to rent houses in London, and buy and sell their own commodities, without any interruption from the citizens. Previous to this date they hired lodgings, and their landlords were the brokers, who sold all their goods, and received a commission upon them. It was soon after pretended that the foreign merchants used false weights, and a clamour being raised against them, twenty of them were arrested and sent to the Tower. Amidst the numerous absurd restrictions to which commerce and manufactures were subjected, we need not be surprised at the little progress which they made.

The materials which history affords respecting the woollen manufacture before the reign of Edward III., are but scanty; it appears that the office of aulnager, or cloth-inspector, was

very ancient. In the reign of Edward I., we are informed by Madox, that Peroult le Tayleur, who held the office of aulnager of cloth in the several fairs of the realm, having forfeited it, the king, by writ of privy seal, commanded the treasurer to let Pieres de Edmonton have it, if he were fit for it, and a writ was made out accordingly, and he took the oaths of that office before the treasurer and barons. The facts above-stated prove the existence of the cloth-manufacture in England before the time of Edward III., who is generally supposed to have first introduced the art into the kingdom. There is no doubt, that a new impulse was given to it during this reign by the liberal protection granted to foreign manufactures here: in all probability, they first introduced the manufacture of stuffs from combed wool or worsteds; an art requiring more skill, and more complicated processes, than are employed in the making of cloth.

In the year 1331, John Kemp, a master manufacturer from Flanders, received a protection to establish himself here with a number of dyers and fullers to carry on his trade, and in the following year several manufacturers came over from Brabant and Zealand. It is said, that the king's marriage with the daughter of the earl of Hainault, enabled him to send over emissaries without suspicion, to invite the manufacturers to this kingdom. These manufacturers were distributed over the country, at the following places:—The manufacturers of fustians (woollens) were established at Norwich, of baize at Sudbury in Suffolk, of sayes and serges at Colchester in Essex, of broad-cloths in Kent, of kersies in Devonshire, of cloth in Worcestershire and Gloucestershire, of Welsh friezes in Wales, of cloth at Kendal in Westmoreland, of coarse cloths, afterwards called Halifax cloths, in Yorkshire, of cloth in Hampshire, Berkshire, and Sussex, and of serges at Taunton in Devonshire. (*Rymer's Fœdera*, vol. i. p. 195.) Fresh supplies of foreigners contributed to advance the woollen trade of these districts.

Kendal, in Westmoreland, claims the honour of first receiving John Kemp, where his descendants still remain, and the woollen trade is at present carried on. In the following reign, we find the manufacturers of Kendal petitioning to be relieved from the regulations imposed on broad cloths. Kendal green is mentioned by Shakspeare as an article of dress in the time of Henry IV., and there is reason to believe, that in the reign of Elizabeth, the woollen manufactures of that town were as extensive as at present.

In the year 1336, two woollen manufacturers from Brabant settled at York, under the king's protection: they are styled in the letters of protection, "Willielmus de Brabant and Hanckcinus de Brabant, Textores." These persons probably laid the foundation of the woollen and worsted manufactures, which have since so extensively flourished in the western part of that county. It is not very improbable, that the manufacturer Hancks, called Hanckcinus, gave the name to the skein of worsted, which is to this day called a hank.

In order to form a more distinct idea of the relative value of wool, cloth, and other articles, after and before the reign, it may be proper to refer to the state of the silver coinage.

at which it continued to the present reign.

The following account of the exports and imports in the

28th of Edward III., said to be found in a record of the exchequer, was published by Edward Misseldon, merchant, in the year 1623.

Exports.	£.	s.	d.
Thirty-one thousand six hundred and fifty-one sacks and a half of wool, at six pounds value each sack, amount to	189,909	0	0
Three thousand thirty-six hundred and sixty-five felts at 40s. value, each hundred at six score, amount to	6,073	1	8
Whereof the custom amounts to	81,624	1	1
Fourteen last, seventeen dicker, and five hides of leather, after six pounds value the last, amount to	89	5	0
Whereof the custom amounts to	6	17	6
Four thousand seven hundred and seventy-four cloths and a half, after 40s. value the cloth, is	9,549	0	0
Eight thousand and sixty-one pieces and a half of worsted, after 16s. 8d. value the piece, is	6,717	18	4
Whereof the custom amounts to	215	13	7
<hr/>			
Summary of the out-carrid commodities in value and custom	294,184	17	2
Imports.			
One thousand eight hundred and thirty-two cloths, after six pounds value the cloth Whereof the custom amounts to	10,922	0	0
	91	12	0
Three hundred and ninety-seven quintals and three quarters of wax, after the value of 40s. the hundred or quintal	795	10	0
Whereof the custom is	19	17	0
One thousand eight hundred and twenty-nine tons and a half of wine, after 40s. per ton	3,659	0	0
Whereof the custom is	182	0	0
Linen cloth, mercury, and grocery-wares, and all other manner of merchandize	23,014	16	0
Whereof the custom is	285	18	3
<hr/>			
Summary of the in-brought commodities, in value and custom, is	38,970	13	3
Summary of the impulse of the out-carried above the in-brought commodities, amounteth to	255,214	3	11

Admitting the correctness of this statement, which we have no reason to doubt, we must observe, that the cloth imported was of a higher value per yard than the cloth exported. Hence it may be inferred, that for several years after the arrival of the Flemish weavers, we were partly dependent on foreigners for our fine cloths; the coarser kinds then, as at the present day, forming the larger quantity of our exports. It is obvious also, that worsted goods had become an article of manufacture, nearly equal in importance with the woollen; and hence it is not improbable, that the greater part of the Flemish manufacturers were makers of stuffs and worsted goods, which was probably an entirely new trade in England.

In the third year of Edward IV. the woollen trade had increased so much, that the importation of woollen cloth, caps, &c., was prohibited. Woollen caps or bonnets were then universally worn; they were either knitted or made of cloth, and a large quantity of wool must have been consumed in their fabrication. About the year 1482, hats made from felts were introduced; but the manufacturers of caps, called the cappers, continued a powerful body a century afterwards. In the same reign, the wardens of worsteds at Norwich were doubled, or increased to eight.

The manufacture of fine broad-cloth must have been considerably improved about this time; for in the fourth of Henry VII. it was thought prudent to fix a maximum on the price of fine cloth, by which every retailer of cloth who should sell a yard of the finest scarlet grained cloth above

sixteen shillings, or a yard of any other coloured cloth above eleven shillings, was to forfeit forty shillings per yard for the same.

In the year 1493, in consequence of a quarrel between Henry VII. and the archduke Philip, all intercourse between the English and Flemish ceased, and the mart for English goods was transferred from Antwerp to Calais. This interruption to the regular course of trade was severely felt by the woollen manufacturers. Lord Bacon, mentioning the renewal of the trade with Flanders, which took place again in 1496, says, "By this time the interruption of trade between the English and Flemish began to pinch the merchants of both nations very sore. The king, who loved wealth, though very sensible of this, kept his dignity so far as first to be sought unto. Wherein the merchant adventurers, likewise did hold out bravely; taking off the commodities of the kingdom, though they lay dead upon their hands for want of vent." The merchant adventurers he describes as "being a strong company, and underset with rich men." It is not, however, very probable, that this company would continue to purchase goods without a prospect of gain. These merchant adventurers were divided into two bodies; those of London, which were the most powerful; and the merchant adventurers of England, who paid a fine to the former on all goods sold at the foreign marts.

In the reign of Henry VIII. the woollen trade, and particularly all kinds of worsted manufactures appear to have been in a very flourishing state, though trade suffered several severe checks from the wars in which we were engaged. In the year 1527, Henry, having entered into a league with France against the emperor Charles V., all trade with Spain and the Low Countries ceased. The goods sent to Blackwell-hall found no purchasers, the merchants having their warehouses filled with cloths; the poor manufacturers being thus deprived of employment, an insurrection took place in the county of Suffolk, where four thousand of them assembled but were appeased by the duke of Norfolk. The merchants were summoned to appear before cardinal Wolsey, who in the name of the king reprimanded them in an angry tone for not purchasing the goods brought to market, and threatened them that his majesty would open a new mart at Whitehall, and buy of the clothiers to sell again to foreign merchants; to which menace one of them pertinently replied, "My lord, the king may buy them as well at Blackwell-hall if it pleases him, and the strangers will gladlier receive them there than at Westminster."—"You shall not order that matter," said the cardinal; "and I shall send into London to know what cloths you have on your hands, and by that done, the king and his council shall appoint who shall buy the cloths, I warrant you." With this answer the Londoners departed.

The interference of the cardinal raised the spirits of the manufacturers for a time, but originating in ignorance of the nature of trade, it could only have a temporary effect, and goods fell again till a truce between England and Flanders was made for the benefit of trade. This fact shews the dependence of England, even at that time, on the export of manufactured woollens. In this reign we find Lancashire and Cheshire first named as seats of the manufacture of coarse woollens; they are mentioned, together with Cornwall and Wales, as districts where friezes were made. It appears from various references, that Norfolk and Suffolk were then flourishing seats of the worsted manufacture, and of all goods made with a worsted warp. Wardens were allowed to the towns of Yarmouth and Lynn, but with a selfish restriction, that the pieces were to be dyed, spun, or callendered in the city of Norwich. In the last year of this reign, an act was passed to prevent any persons besides woollen manufacturers, who bought wool for their own use, and merchants of the staple, who bought for exportation, to purchase wool with the intent to sell again. This act extended to twenty-eight counties, and secured a monopoly of the wool to the merchants of the staple, and to the rich clothiers. In the first year of the following reign, Edward VI., it was repealed, so far as to allow every person dwelling in Norwich and Norfolk,

folk, to buy wool, the growth of that county, by themselves or agents, and retail it out in open market. The reason assigned is this: That almost the whole number of poor inhabitants of the county of Norfolk and city of Norwich had been used to get their living by spinning of Norfolk wool, which they used to purchase by eight-pennyworth or twelve-pennyworth at a time, selling the same again in yarn; and because the grower chose not to parcel it in such small quantities, therefore for the benefit of the poor, the wool of Norfolk was allowed to be purchased by wool-dealers. By this act, the 33d of Henry VIII., for prohibiting the exportation of yarn, is made perpetual. The manufacture of woollens in the counties adjoining London appear to have been extensive, particularly in the county of Berkshire; for, in the beginning of the reign of Henry VIII., John Winchcombe, of that county, commonly called *Jack of Newbury*, was celebrated as the greatest clothier in England. He kept one hundred looms in his own house, and in the expedition against the Scotch, he sent to Flodden field one hundred men, fully equipped at his own expense. Even so early as the 13th century, one Thomas Cole was distinguished by the name of the rich clothier of Reading, in Berkshire.

York, then the second city in the kingdom, and from its connection with the port of Hull well situated for the export trade, was probably an early seat of the woollen manufacture. We have already mentioned the settlement of two clothiers from Brabant in the time of Edward III. We do not learn precisely in our early historians, when the manufactures emanated from that city into the western parts of the county; but, from an act in the 34th of Henry VIII., we are informed, that the chief manufacture of that city was the making of coverlets; the act recites, "that the poor of that city were daily employed in spinning, carding, dyeing, weaving, &c., for the making of coverlets, and that the same have not been made elsewhere in the said county till of late; that this manufacture had spread itself into other parts of the county, and was thereby debased and discredited, and therefore it is enacted, that none shall make coverlets in Yorkshire but the people of York." Thus we see, under the flimsy pretext of public benefit, the manufacturers were willing to disguise that selfish spirit of monopoly, which disgraces almost every page of our commercial history. The municipal regulations of the city of York, which were, and still continue, to be, hostile to a free trade, probably obliged many manufacturers, who were not sharers in the monopolies of the guild, to establish themselves in the western villages of the county, where provisions were cheaper, and where they could carry on their trade without restriction. In the reign of Philip and Mary, soon after this period, we have the following interesting account of Halifax, in consequence of an act passed in the 37th of Henry VIII. to prevent any other persons than merchants of the staple and woollen manufacturers from buying wool in the county of Kent and twenty-seven shires. The poorer manufacturers, who were unable to lay in their stock of wool at one time, being hereby deprived of their trade, made application for redress, which was granted. The act recites as follows: "Whereas the town of Halifax being planted in the great waste and moors, where the fertility of the ground is not apt to bring forth any corn nor good grass, but in rare places, and by exceeding and great industry of the inhabitants; and the same inhabitants altogether do live by cloth-making, and the greater part of them neither getteth corn, nor is able to keep a horse to carry wools, nor yet to buy much wool at once, but hath ever used to repair to the town of Halifax, and there to buy some two or three stone, according to their ability, and to carry the same to their houses, three, four, or five miles off, upon their heads and backs, and so to make and convert the same either into yarn or cloth, and to sell the same, and so to buy more wool of the wool-driver; by means of which industry, the barren grounds in those parts be now much inhabited, and above five hundred households there newly increased within these forty years past, which now are like to be undone and driven to beggary by reason of the late statute (37th of Henry VIII.)

that taketh away the wool-driver, so that they cannot now have their wool by such small portions as they were wont to have, and that also they are not able to keep any horses whereupon to ride or fetch their wools further from them in other places, unless some remedy may be provided. It was therefore enacted, that it should be lawful, to any person or persons inhabiting within the parish of Halifax, to buy any wool or wools at such time as the clothiers may buy the same, otherwise than by engrossing and forestalling, so that the persons buying the same do carry the said wools to the town of Halifax, and there to sell the same to such poor folks of that and other parishes adjoining, as shall work the same in cloth or yarn, to their knowledge, and not to the rich and wealthy clothier, or any other to sell again. Offending against this act to forfeit double the value of the wool so sold."

From this we learn that many woollen manufacturers had been either driven from York at an early period, by the oppression of the municipal regulations, or had retired where provisions were cheaper, and where they had better streams for the erection of fulling-mills, and for other processes of the manufacture, such as dyeing and scouring.

The woollen manufactures also gradually retired from the vicinity of the metropolis, owing to the increased price of provisions and labour, and probably also to the difficulty of obtaining commodious streams for the scouring and fulling of cloth, when the country round London became more populous. In the latter part of the reign of Henry VIII., we are informed, that the king demised to William Webbe the subsidy and aulnage of all cloth made in the county of Monmouth, and in the twelve shires of Wales. A former act of this reign, speaking of the manufacturers of North Wales, says, they had been used to sell their cloths so craftily and hard rolled together, that the buyer could not perceive the untrue making thereof. These acts prove the extension of the woollen manufactures westward.

In the same reign, an act mentions the woollen manufactures as being established in Worcestershire, but prohibits any one from making cloth in the county, except within the city of Worcester, and in the towns of Evesham, Droitwich, Kidderminster, and Bromsgrove; and forbids the owners of houses in those places from letting them at advanced pries to the cloth-manufacturers. The woollen manufacture has continued to the present day at the two last of these towns. In the reign of Edward VI., Coventry and Manchester are mentioned as manufacturing places. The manufacturers in the old established seats of the woollen trade appear to have been greatly alarmed at the extension of the cloth manufacture, and to have exerted all their influence to restrain it. Near the conclusion of the reign of Philip and Mary, an act in 53 sections was passed, relating to the making of woollen cloths. It enacts, that no person shall make woollen cloth but only in a market-town, where cloth hath commonly been used to be made for the space of ten years last past, or in a city, borough, or town corporate. From this restricting act, however, the following exceptions are made: to all persons who dwell in North Wales or South Wales, Cheshire, Lancashire, Westmoreland, Cumberland, Northumberland, the bishopric of Durham, Cornwall, Suffolk, Kent, the town of Godalmin in Surrey, or in Yorkshire, being not within twelve miles of the city of York, or any towns or villages near the river Stroud in Gloucestershire. This act, so absurd and oppressive, was obliged to be modified in the first year of the following reign, by an act entitled "An Act for the continuing and making of Woollen Cloths in divers Towns in the County of Essex." Bocking, Watherfold, Cockshill, and Dodham, are the towns specified.

In consequence of the increase of our manufactures, the export of wool had nearly ceased before the reign of Elizabeth; and a considerable advance appears to have taken place in the price of food, clothing, and rents.

The declension of our manufactures in the succeeding reigns of the Stuarts, as we have reason to believe, extended much more to woollen cloths than to worsted pieces. Long
wool,

wool, or combing-wool, was more the peculiar produce of England than clothing-wools. The latter were grown in abundance, and of a superior quality, in Spain, Portugal, and France; but the combing-wools of England, on account of the superior soundness of the staple or fibre, and the quantity supplied, gave a decided advantage to our manufacturers of stuffs or worsted pieces.

The persecution of the Protestants by the duke of Alva in the Netherlands drove multitudes of the manufacturers into England, where they were graciously received by Elizabeth, who gave them liberty to settle at Norwich, Colchester, Sandwich, Maidstone, and Southampton. These refugees contributed to extend our manufactures of worsted goods and light woollens, called bays and says; they also introduced the manufacture of linens and silks, and it is supposed that they first taught the art of weaving on the stocking-frame.

A great part of our woollen exports hitherto consisted of white undressed cloth; but in the important reign of James I. it was represented as bad policy to permit the exportation of cloth in this state, and thereby lose the profit on the dyeing and finishing. A letter exists addressed to king James on this subject, ascribed to Sir Walter Raleigh, but without sufficient evidence, as "the most ancient manuscripts of this letter in the libraries of the nobility ascribe it to John Keymer." (Oldy's Life of Sir W. Raleigh.) In this letter it is stated, "that there have been eighty thousand undressed and undyed cloths exported yearly, by which the kingdom has been deprived of four hundred thousand pounds for the last fifty-five years, which is nearly twenty millions that would have been gained by the labour of the workmen in that time, with the merchants' gains for bringing in dyeing-wares, and return of cloths dressed and dyed, with other benefits to the realm." The writer proceeds, in another part, to state, that there had also been exported in that time annually, of baizes and northern and Devonshire kersies, in the white, fifty thousand cloths, counting three kersies to a cloth, whereby had been lost about five millions to the nation in labour, profit, &c. The author informs us, that the baizes so exported were dressed and dyed at Amsterdam, and shipped to Spain, Portugal, and other kingdoms, under the name of Flemish baize, setting their own seal upon them; "so that we lose the very name of our home-bred commodities, and other countries get the reputation and profit thereof." The author concludes with asserting, that the nation loses a million a year by the export of white cloths, which might be dressed and dyed as well at home. This letter has been often quoted as containing unanswerable reasons for confining the whole process of the cloth manufacture to our own country; but, like other monopolists, the writer seems to forget that there are two parties in all mercantile transactions, and that manufactured goods must be sent in that state in which the purchaser is willing to receive them, unless it be proved that he cannot procure them elsewhere. Let us mark the result. Alderman Cockayne, and other London merchants, had sufficient influence with the government to obtain the prohibition of the export of white cloths, and to secure a patent for dressing and dyeing of cloths. In consequence of which, the Dutch and Germans immediately prohibited the importation of dyed cloths from England, which gave so great a check to our export trade, that in the year 1616, the whole amount of cloths exported of every kind amounted only to sixty thousand, so that the export trade in woollens had fallen to less than one-third of its former amount; and in the year 1622,

	£.	s.	d.
All our exports of every kind } amounted only to	2,320,436	12	10
Whilst our imports were	2,619,315	0	0
Leaving a balance against us of	298,878	7	2

During the reigns of the Stuarts, the infamous policy they adopted struck not only at the liberty, but at the commer-

cial prosperity of the country. Archbishop Laud, imbued with the malignant zeal of a bigot, commenced his attacks on the descendants of the French Protestants, established as manufacturers of woollens in Norfolk and Suffolk, from which counties his persecuting fury drove some thousand families. Many of them settled in New England; but others went into Holland, where they were encouraged by the Dutch, who allowed them an exemption from taxes and rents for seven years. In return for this, the states were amply repaid by the introduction of manufactures, with which they were before unacquainted. In the year 1622, king James issued a proclamation to prohibit the exportation of wool, fuller's-earth, &c. In 1640 wool was again admitted to be exported on the payment of certain duties; and we are told, that in the same year Sir John Brownlowe, of Belton in Lincolnshire, sold three years' wool at twenty-four shillings per tod to a baize-maker of Colchester. As it is reasonable to suppose that this was the long combing-wool of that country, it shews the high relative price of the article at that time. In 1647, owing to the high price of wool, its exportation was again prohibited.

During the civil wars, the manufactures and export trade of England declined, and the Dutch availed themselves of this to extend their own manufacture and export of woollens; particularly to Spain, from whence they brought fine Spanish wool. At this time it appears, that the woollen manufactures in Poland and Silesia were rapidly increasing; and the English government received information that two hundred and twenty thousand cloths were made there annually, besides considerable quantities made at Dantzic, and in the vicinity.

The duke of Brandenburg, it was also stated to our government, had ordered one hundred thousand ells of Silesia cloth at Königsberg for his troops, which had been heretofore supplied with English cloth. The estimation in which our cloth had been held is said to have been lost by negligence in the manufacture, particularly in the spinning and weaving. The Dutch and Poles had a little before this time received a great number of Protestant manufacturers, who fled from the persecution of the duke of Alva in Brabant and Flanders.

Here it may be proper to remark, that the English as a nation had little intercourse with other parts of the world, except through a few large trading companies: hence they were extremely ignorant respecting the state of foreign countries, and supposed that the cloth trade had been confined to their own country for three hundred years; and they considered the establishment of other manufacturers as a novelty and infringement of their just rights. With these views it was proposed to obtain a complete monopoly of all the clothing-wools in Spain, in order to prevent the Dutch and other nations from rivalling our manufactures. This is the more extraordinary, as the English had not then learned, like the Dutch, to manufacture Spanish wool, without mixing it with that of their own country. It is needless to say, that the negotiation of Sir William Godolphin for this selfish monopoly of wool was not successful. During the whole reign of Elizabeth, when our woollen manufactures were in the highest state of prosperity, wool and woolfels were permitted to be exported. In the reign of James I. and Charles I., when the trade was declining, proclamations were issued to prevent the exportation of wool, and also that of fuller's-earth. During the commonwealth, an ordinance of parliament was issued to prohibit the exportation of wool, and fuller's-earth, on pain of forfeiture of the wool, and a penalty of 3s. per pound on every pound of fuller's-earth. The first act of parliament which absolutely prohibited the exportation of wool by making it felony, and which could not be set aside by a royal licence, is the 12th of Charles II., which was passed soon after the Restoration.

It is deserving of notice, that, in the latter period of the Commonwealth, our trade is said to have greatly revived, but to have suffered a miserable depression almost immediately after the restoration of Charles II. In a letter of M. Downing of the Hague to the president of the council in London,

London, 1660, printed in Thurloe's State Papers, vol. vii. p. 848, it is stated, that great quantities of wool were brought secretly from England to Holland; and he adds, that the Dutch had at that time got in a great measure the manufacture of fine cloth, and would probably, with Silesia, engross also the manufacture of coarse cloth, and leave England nothing but its native wool to export.

In the year 1662 great complaints were made against the merchant adventurers for their neglect of the cloth trade; in reply to which they said, that the demand for English cloths failed in the foreign markets, the white clothing trade having abated from 100,000 cloths annually to 11,000. In the year 1663 our whole exports were only about two millions and our imports four, leaving a balance of two millions against this country. It is, however, deserving notice, that the number of wardens for the inspection of stuffs at Norwich being too few, they were at this time increased from five to eight. A letter on the state of trade, published in 1667, says, clothing-wools were so much fallen at that time, that the best Spanish was sold at 2s. 2d. per pound, and English at 8d. per pound. The writer ascribes the fall in the price of English wool to our wearing so much Spanish cloth, a great part not manufactured by ourselves, as Dutch blacks; but it is obvious, from the price of Spanish wool, that the low price of clothing-wool at that time depended on a more general cause, affecting all manufacturing countries. To relieve the cloth trade from the great depression under which it laboured between the years 1660 and 1678, various schemes were devised. Among others, the mayor and common council of London passed an act "for the regulation of Blackwell-hall, Leaden-hall, and Welsh-hall, (the three public markets for cloth in London,) and for preventing foreigners buying and selling!" By foreigners are understood all persons not free of the city of London. This act, a most singular monument of the ignorance or selfishness of its authors, prohibits the sale of all woollen cloths sent to London, except at the above halls, where certain duties were to be paid upon them, and from whence they could not be removed for three weeks, unless they were sold in the meantime to some draper, or other freeman of the city. The hall-keepers were to attend strictly at the halls, and turn out all foreigners and aliens coming to purchase cloth; and every freeman of the city who should introduce a purchaser into the halls not free of the city should forfeit, for the first offence, five pounds,—for the second, ten,—and for the third, fifteen pounds! Thus, in those days, turning purchasers out of the public markets, and securing the sale to a certain class of buyers, was considered an act for the benefit of the public.

After the accession of William, our manufacturers, who were warmly attached to the cause of religious liberty, being the greater part protestant dissenters, were animated to uncommon exertions in the restoration of their trade. This is evident from the state of our exports in the following year after the revolution in 1689, when they amounted to near seven millions, of which the woollens were nearly three millions.

About the year 1722, the plague at Marseilles, by preventing the exportation of French woollens, increased the demand for English manufactures considerably. In the year 1737 the woollen exports amounted to 4,158,643*l.*; and it is remarkable, that at that period the price of wool was uncommonly low.

From this time to the period of the American war in 1775, the woollen manufactures, and particularly the worsted, still continued to increase, with occasional checks. The quantity of long combing-wools grown in England, had given to the manufacturers of worsted goods a decided advantage over those of France, though the ingenuity of the latter in the manufacture of *les petites draperies*, as the worsted goods are called, was greatly superior to what our own workmen had ever shewn. The demand for worsted goods at home, for tammies and stuffs, which were the general dress of females before the year 1775, was very great; besides which, we supplied with worsted goods many of the southern parts of Europe, and particularly Spain and Portugal, for the use of

their South American colonies, and for the dresses of the clergy, monks, and nuns, which form no inconsiderable part of the population in those countries. About the year 1775, the introduction of Arkwright's inventions for spinning, carding, &c. into the cotton trade, produced a great change in the article of female dress in England, stuffs and tammies being supplanted by cotton goods, which were become extremely cheap. The failure of the foreign trade also greatly affected our manufactures, both woollens and worsteds. The price of English wool at the latter end of the American war, was lower than it had been in any period of our history, when money was of much higher relative value. A tod of 28lbs. of the best Lincolnshire wool for combing was not worth more than nine shillings, and the inferior kinds six shillings, or about three-pence and four-pence per pound: From the time of Elizabeth to the middle of the last century, scarcely any alterations or improvements had taken place in the processes of manufacture, either in woollen or worsted, beyond the variation of colours or patterns, to suit the fashion of the day. The ingenious mechanical inventions of Arkwright, applied to the spinning and carding of cotton, were soon after modified, and applied to the woollen and worsted trade, and produced an entire revolution in some of the seats of their manufacture. Before that period, the manufacture of heavy woollens and coarse worsted goods had been gradually concentrating into Yorkshire and Lancashire, where the cheapness of living, the active industry of the inhabitants, and, above all, the cheapness and abundance of coal, gave the manufacturers a decided advantage over those in the midland and western counties.

WOOL, a township of England, in Dorsetshire; $5\frac{1}{2}$ miles west-south-west of Wareham. Population 481.

WOOLAND, a parish of England, in Dorsetshire; 8 miles from Blandford.

WOOLASTON, a parish of England in Gloucestershire; $6\frac{1}{2}$ miles south-west of Blakeney. Population 646.—2. A parish in Nottinghamshire, near Nottingham.

WOOLASTON, GREAT, a township of England, in Salop; 11 miles west of Shrewsbury.

WOOLAVINGTON, a parish of England, in Somersetshire; $4\frac{1}{2}$ miles north-east of Bridgewater.—2. A parish in Sussex; $4\frac{1}{2}$ miles south-south-west of Petworth.

WOOLBEDING, a parish of England, in Sussex; $1\frac{1}{2}$ mile north-west of Midhurst.

WOOLBOROUGH, a parish of England, in Devonshire; 1 mile south of Abbot's Newton.

WOOLCOMBE, a hamlet of England, in Dorsetshire; 7 miles south-east of Beaminster.—2. Another hamlet in the same county; 8 miles south-by-west of Sherborne.

WOOLCOMBER, *s.* One whose business is to comb wool.—Of "The Fleece," which never became popular, and is now universally neglected, I can say little that is likely to recall it to attention. The *woolcomber* and the poet appear to me such discordant natures, that an attempt to bring them together is to "couple the serpent with the fowl!"
Johnson.

WOOLDALE, a parish of England, West Riding of Yorkshire; 7 miles from Huddersfield. Population 3083.

WOOLDINGHAM, a parish of England, in Surrey; 2 miles from Godstone.

WOOLER, a market town of England, in the county of Northumberland, situated on Wooler water, near the Cheviot hills. It contains several streets, and was formerly much resorted to for goat's whey. The parish church, a plain building, was erected in 1765, nearly on the site of the old one. Here are chapels for the Presbyterians, Burghers, Baptists, and Catholics. Here are also the ruins of a very old tower or castle, standing on a bank called the Tower Bank. In the neighbourhood are vestiges of several ancient encampments; and, on the Edinburgh road, at the distance of two miles from Wooler, stands a large whinstone, supposed to mark the spot where Henry, lord Percy, and George, earl March, defeated 10,000 Scots under earl Douglas. It has a weekly market on Thursday; two fairs, viz. on the 4th May

and 17th October; 45 miles north-north-west of Newcastle, and 317 north of London. Population in 1821, 1455.

WOOLFARDISWORTHY, two parishes of England, in Devonshire, the one 9½ miles south-west of Bideford; the other 6 miles north-by-west of Crediton.

WOOLFEL, *s.* Skin not stripped of the wool.—Wool and *woolfels* were ever of little value in this kingdom. *Davies.*

WOOLFORD, GREAT and LITTLE, a parish and township of England, in Warwickshire; 3 miles south of Shipston-upon-Stour.

WOOLHAMPTON, a parish of England, in Berkshire; 7 miles east of Newbury.

WOOLHOPE, a parish of England, in Herefordshire; 7 miles from Hereford. Population 485.

WOOLLASON, a hamlet of England, in the parish of Mixbury, Oxfordshire.

WOOLLEN, *adj.* Made of wool not finely dressed, and thence used likewise for any thing coarse: it is likewise used in general for *made of wool*, as distinct from *linen*.

I was wont

To call them *woollen* vassals, things created
To buy and sell with groats.

Shakspeare.

WOOLLEN, *s.* Cloth made of wool.

Odious! in *woollen*! 'twould a saint provoke!

No, let a charming chintz and Brussels lace

Wrap my cold limbs, and shade my lifeless face. *Pope.*

WOOLLEY, a parish of England, in Huntingdonshire; 5½ miles north-east of Kimbolton.—2. A township in the West Riding of Yorkshire; 5½ miles north-by-west of Barnesley. Population 543.—3. A hamlet in Somersetshire; 3 miles from Bath.

WOOLLI, a small kingdom of Western Africa, extending along the north side of the Gambia, having Tenda on the south-east, and Bondow on the north-east. It is level, and covered entirely with wood. Mr. Park, in his first journey, received a very hospitable reception from the king, who, however, endeavoured to dissuade him from his dangerous journey.

WOOLLINESS, *s.* State or quality of being woolly.

WOOLLOS, *St.*, a hamlet of England, in Monmouthshire, adjacent to Newport.

WOOLLY, *adj.* Clothed with wool.

When the work of generation was

Between these *woolly* breeders,

The skilful shepherd peel'd me certain wands. *Shakspeare.*

Consisting of wool.

Some few, by temp'rance taught, approaching slow,

To distant fate by easy journeys go:

Gently they lay 'em down as evening sheep

On their own *woolly* fleeces softly sleep. *Dryden.*

Resembling wool.

What signifies

My fleece of *woolly* hair, that now uncurls? *Shakspeare.*

WOOLMAN (John), a minister of the society of Friends in North America, chiefly remarkable as an early and faithful advocate of the rights of the enslaved Africans, was born at Northampton, in Burlington county, West New-Jersey, in the year 1720. From some memoirs of his life left by himself, it appears that he had strong impressions of religion in childhood, which being seconded by the care and admonition of pious parents, he arrived at manhood, after a struggle of some years with youthful levities, with a decidedly religious character. An incident which befel him when a child, and which he records as a proof of the early influence of divine grace on the mind, may be mentioned here, as connected also with his future character, and with the first development of those tender sympathies of the heart which, under the guidance of Christian principle, fitted him so eminently to espouse the cause of the oppressed negroes. Going on an errand to a neighbour's, he observed that a robin quitted her nest at his approach, and flew about in alarm for her young ones. He

stood and threw stones at her, till being struck, she fell down dead. "At first," he says, "I was pleased with the exploit, but after a few minutes was seized with horror. I beheld her lying dead, and thought those young ones, for which she had been so careful, must now perish for want of their dam to nourish them; and after some painful considerations on the subject, I climbed up the tree, took all the young birds, and killed them, supposing that better than to leave them to pine away, and perish miserably. I then went on my errand, but for some hours could think of little else but the cruelties I had committed, and was much troubled. Thus He, whose tender mercies are over all his works, hath placed a principle in the human mind, which incites to exercise goodness towards every living creature: and this being singly attended to, people become tender-hearted and sympathising, but being frequently and totally rejected, the mind becomes shut up in a contrary disposition." Of his opinions at 21 he writes thus: "I was early convinced in mind that true religion consisted in an inward life, wherein the heart doth love and reverence God the Creator, and learns to exercise true justice and goodness, not only toward all men, but also toward the brute creatures. I found no narrowness respecting sects and opinions, but believed that sincere, upright-hearted people in every society, who truly loved God, were accepted of him."

The right of every individual, of whatever colour, who has not offended against society, to liberty and the common gifts of providence, was consequently at this time an article of John Woolman's religious creed; and we shall see that he soon brought himself to act in consistency with his faith. The first occasion of trial occurred while he was yet in servitude; for he had engaged himself as clerk and assistant to a shopkeeper at a place called Mount-Holly. His employer parted with a negress, and desired Woolman to write out a bill of sale for her. "The thing," says he, "was sudden, and although the thought of writing an instrument of slavery for one of my fellow-creatures felt uneasy, yet I remembered that I was hired by the year, that it was my master who directed me to do it, and that it was an elderly man, a member of our society, who bought her. So through weakness I gave way and wrote; but at the execution of it I was so afflicted in my mind, that I said before my master and the friend, that I believed slave-keeping to be a practice 'inconsistent with the Christian religion.' This in some degree abated my uneasiness; yet as often as I reflected seriously upon it, I thought I should have been clearer if I had desired to be excused from it, 'as a thing against my conscience:' for such it was." Accordingly, on the next occasion, he took this second step. "A young man of our society," he proceeds, "spoke to me to write a conveyance of a slave to him, he having lately taken a negro into his house. I told him I was not easy to write it; for though many of our meeting and in other places kept slaves, I still believed the practice was not right." Other cases followed, in which being employed (as it appears for an adequate fee) to write the will of a neighbour or a friend, he uniformly refused to be accessory to their bequeathing as property the persons of his fellow-men. "Deep-rooted customs," he observes, "though wrong, are not easily altered; but it is the duty of all to be 'firm in that' which they certainly know is 'right for them.' A charitable benevolent man, well acquainted with a negro, may, I believe, under some circumstances, keep him in his family as a servant for no other motive than the negro's good. But man, as man, knows not what shall be after him, nor hath assurance that his children will attain to that perfection in wisdom and goodness necessary rightly to exercise such power," viz. as that of the owner over his slave. As the first-fruits of this firmness, and which no doubt were highly grateful, he relates instances in which his refusal, and the reasons he gave for it, procured the freedom in lieu of the transmission of the slaves in question.

He committed to paper his sentiments on slave-keeping, and after the MS. had lain long by him, it was published, with the approbation and at the expense of his friends, who began (in Pennsylvania and the Jerseys at least) to be more generally

generally influenced by the humane and Christian views of Woolman Benezet and others on this subject. It was entitled "Some Considerations on the keeping of Negroes;" and in 1762 was followed by a "Second Part," the expense of which he preferred to take upon himself, for a reason which evinces his strict regard to justice. He considered that many, who did not yet see the evil of the practice, nor approve of his writings against it, were contributors to the general fund of the society, out of which the cause was proposed to be defrayed.

Some other reflections, written in 1757, while he was on a journey among slave-holders, and recorded in his "Memoir," are forcibly descriptive of his views and feelings.

The necessary brevity of this article will permit only a general account of John Woolman's labours in the cause of humanity. From private conferences with the holders of slaves, he proceeded to public addresses to the society in their meetings for discipline; and when at length the principle of the unlawfulness to Christians of this degrading practice had been generally recognized among them, he united other members with himself in paying visits to such of the society; within his sphere of action, as required the stimulus of remonstrances to induce them to comply with the sense of their brethren on this subject. These proceedings were prosecuted through several journeys; in which at one time the religious welfare in a more general sense, at another the right conduct in this particular of his fellow-members, engaged his attention. He did not live to see the completion of his wish as it related to the society; for it was not till the year 1787 that the last slave disappeared from among them. But the near approach of this consummation was witnessed by his coadjutor, Anthony Benezet, who died in 1784, whose fame has spread wider than Woolman's, because his opportunities were more extensive, who lived for the cause throughout Europe, and carried its successful plea from the narrow limits of the society of Friends into the world at large. Of this excellent man, whose biography escaped the early part of this work, it may not be too late here to record in brief,—that he was born at St. Quintin, in Picardy, of a respectable family, in 1713; that he was carried by his father, who fled from the persecutions which fell upon the Huguenots, to London, and there formed for mercantile pursuits; that upon removing to Philadelphia with his family in 1731, having now entered into the society of Friends, he devoted his life, upon principle, first to the education of youth in useful knowledge and the Christian faith, and ultimately to the noblest toils of humanity. But to return to our present subject: in the year 1772, John Woolman, believing it his duty to pay a religious visit to the friends in England, embarked for that purpose at Chester, on the Delaware, and arrived at London in time to attend their yearly meeting. After it he travelled, exercising his ministry among his friends, through several counties, as far as York. Here, at a large quarterly meeting, he once more pleaded for the negroes, endeavouring, and probably with effect, to engage the support of those present to the cause of humanity: soon after which he was seized with the small-pox. During a severe struggle with this disease, he manifested great patience and humility, with a firm faith in the Redeemer: and nature sinking in the conflict, he expired in peace in his 52d year.—*Memoir of John Woolman, chiefly extracted from a Journal of his Life and Writings, London, 1815.*

WOOLPACK, or **WOOLSAK**, *s.* A bag of wool; a bundle of wool.—As *woolpacks* quash the leaden ball. *Shenstone*.—The seat of the judges in the house of lords.

At bar abusive, on the bench unable,

Knave on the *woolsack*, fop at council table.

Dryden.

Any thing bulky without weight.

Chaos of presby'try, where laymen guide

With the tame *woolpack*-clergy by their side. *Cleaveland.*

WOOLPIT, a village and parish of England, in the county of Suffolk, situated on the road between Bury and Ipswich. It was formerly a market town, and has a horse fair, which lasts a week, from the 16th of September. The church is a handsome Gothic structure, but has a mean spire;

8 miles east of Bury, and 79 north-east of London. Population 696.

WOOLINGTON, a township of England, in Northumberland; 6 miles north-north-west of Newcastle-upon-Tyne.

WOOLSTANTON, a parish of England, in Staffordshire; 1 mile from Newcastle. Population 848.

WOOLSTASTON, a parish of England, in Salop; 10½ miles south-south-west of Shrewsbury.

WOOLSTHORPE, a parish of England, in Lincolnshire; 6 miles west-by-south of Grantham. It is famous for being the birth-place of sir Isaac Newton. Population 456.

WOOLSTON (Thomas), an English divine, was born in 1669, at Northampton, and admitted in 1685 of Sidney college, Cambridge, where he was distinguished by his diligence and regularity. He was elected fellow of his college, took orders, preached with approbation, and was esteemed for his learning and piety. In his exercises for the degree of B. D. he maintained "the exact fitness of the time in which Christ was manifested in the flesh," in a discourse which was well received. But his temper being naturally enthusiastic, and perusing the works of Origen, he indulged a great fondness for allegorical interpretations of scripture, which afterwards led him into a variety of singular and extravagant opinions. He began in 1705 with "The Old Apology for the Truth of the Christian Religion against the Jews and Gentiles revived," maintaining that all the actions of Moses were typical of Christ, and of his church; and the book was issued from the university press. Woolston remained in college till the year 1720, when he went to London, and published a Latin dissertation concerning the supposed epistle of Pontius Pilate to Tiberius, relative to Jesus Christ. In the same year he also published two Latin epistles, addressed to Whitby, Waterland, Whiston, and others: "Circa Fidem vere Orthodoxam et Scripturarum Interpretationem," defending Origen's allegorical interpretation of Scripture. His deviation from the established faith was more apparent in his inquiry, "Whether the people called Quakers do not the nearest of any other sect in religion resemble the primitive Christians in principles and practice?" Blending sarcasm with argument, he now seemed to indulge a spirit of animosity against the clergy. Declining at the same time to reside at college, he was deprived of his fellowship in 1721. In his "Four Free Gifts to the Clergy," he denominated them "hireling priests," and "ministers of the letter." Although he might be suspected, he was not yet chargeable with historical incredulity; for in 1726 he published "A Defence of the Miracle of the Thundering Legion against Mr. Moyle." At length he engaged in the controversy between Anthony Collins and his opponents, and published "The Moderator between an Infidel and an Apostate," and "Two Supplements," in which he not only contended for mystical interpretations of the miracles of Christ, but maintained that they were never actually wrought. Considered as an avowed enemy to the Christian religion, a prosecution was instituted against him by the attorney-general, but stayed by the interposition of Whiston, and some other advocates of toleration. Notwithstanding this lenity, he proceeded in publishing "Six Discourses on the Miracles," and two "Defences of the Discourses," in which, blending ridicule and buffoonery with argument, he maintained his offensive opinions. This pertinacity and rudeness prejudiced believers in the divine mission of Christ against him; replies issued from the press; but as he again became amenable to the law, he was tried at Guildhall before lord chief justice Raymond, when, after many arguments for and against him, he was found guilty, and sentenced to a year's imprisonment, and a fine of 100*l.* Unable to pay his fine, he resided within the rules of the King's Bench, and subsisted by an annual allowance granted to him by his brother, and the contributions of some learned and liberal friends, who vindicated his intentions, whilst they disapproved his enthusiasm and fanaticism. Among these were some, and particularly Dr. S. Clarke, who condemned every species or semblance of religious persecution, and who endeavoured to procure his release; but they could not prevail upon him to stipulate that he would not persevere in publishing

publishing his peculiar opinions. But death gave him that release, which his friends could not obtain from him; as he was carried off by an epidemic disease, within four days after his seizure, in January, 1732-3. Not long before he expired, he said, "This is a struggle which all men must go through, and which I bear, not only patiently, but willingly." His moral character is said to have been unimpeachable, and his head was thought to have been more disordered than his heart.—*Biog. Brit.*

WOOLSTON, a parish of England, in Gloucestershire; 4 miles west-north-west of Winchcombe.—2. A township in Lancashire; 3 miles east-north-east of Warrington.—3. A hamlet in Sussex.

WOOLSTON, GREAT and LITTLE, two parishes of England, in Buckinghamshire, half a mile distant from each other.

WOOLSTONE, a township of England, in Berkshire; 5 miles from Great Paringdon.

WOOLSTONHOLME, a township of England, in Lancashire; 3 miles from Rochdale.

WOOLSTON-WOOD, a township of England, in Cheshire, near Nantwich.

WOOLSTROP, a hamlet of England, in Gloucestershire, parish of Quedgeley.

WOOLTON, LITTLE and MUCH, adjoining townships of England, in Lancashire; 5 miles south-west of Prescott. Population of the former, 528; of the latter, 601.

WOOLVERCOTT, a township of England, in Oxfordshire; 2½ miles from Oxford.

WOOLVERDINGTON, a parish of England, in Warwickshire; 5 miles from Warwick.

WOOLVERSTONE, a parish of England, in Suffolk, situated on the river Orwell; 4 miles south-by-east of Ipswich.

WOOLVERTON, a parish of England, in Southamptonshire; 7½ miles north-west of Basingstoke.—2. Of Norfolk; 5 miles from Lynn.—3. Of Somersetshire; 5 miles from Frome.

WOOLVISTON, a township of England, in Durham; 4½ miles from Stockton. Population 390.

WOOLWARD, *adv.* In wool. *Obsolete.*—I have no shirt: I go *woolward* for penance. *Shakspeare.*

WOOLWICH, a market town of England, in the county of Kent, on the banks of the Thames; 8 miles below London. This place, like Deptford, was originally only a small village, inhabited by fishermen; and like that also owes its consequence to the establishment of a royal dock, in the reign of Henry VIII. Since that era, it has gradually attained to its present size; but its progress has been more particularly rapid during the past century, in consequence of the establishment of the arsenal, and the augmentation of the royal artillery, who have their head-quarters here; owing to which causes, the increase of population within the last hundred years, has been in the proportion of six to one.

The dock-yard is supposed to have been originally established in the reign of Henry VIII.; and has been progressively increasing from that period. In its present state it includes about five furlongs in length, by one in breadth; within which space there are two dry-docks, five ships, three mast-ponds, a mould-loft, store-houses of various descriptions, mast-houses, sheds for timber, dwellings for the various officers, and a very complete smithery, newly erected, and furnished with extensive machinery, worked by steam, for the manufactory of anchors, &c. This dock-yard is under the immediate direction of a commissioner, who has also the controul of that at Deptford; and during the late war, the number of artificers and labourers that were employed here, amounted to nearly 2000; but since the peace, they have been reduced to about two-thirds of that number. Several first rate ships have been built here. The church, dedicated to St. Mary Magdalen, is a spacious building of brick, with stone copings, window frames, &c. standing on an eminence immediately overlooking the dock-yard. It consists of a nave, chancel, and aisles, with a plain square tower at the west end. This edifice was rebuilt between the years 1726 and 1740, at an expense of about 6500*l.*, 3000*l.* of

which were granted under the act of queen Anne, for building fifty new churches; the rest was defrayed by collections made by brief, voluntary contributions, and legacies. The interior is fitted up in the Grecian style; and on the north, south, and west sides are galleries, supported on Ionic columns. The sepulchral memorials are but few. The principal charitable establishments are an almshouse and two schools. The alms-house was founded for five poor widows, previous to the year 1562, by sir Martin Bowes. They now receive 25*l.* yearly, besides coals and other articles. The girls' school was built and endowed, from a bequest made by Mrs. Ann Withers, in 1753, of 100*l.* in money, and 1100*l.* old South sea annuities; for the purpose of teaching 30 poor girls to read, and to work with the needle. The other school was founded under the will of Mrs. Mary Wiseman, who, in 1758, left 1000*l.* old South sea annuities, for the educating, clothing, and apprenticing of six poor orphan boys, sons of shipwrights, who have served their apprenticeships in the dock-yard. The original endowment has been augmented to 1750*l.* by vesting some part of the interest in the funds; and eight boys are now educated, &c. on this establishment. Between the dock-yard and the royal arsenal is an extensive building, about 400 yards in length, including a rope-walk, where several hundred workmen are constantly employed, under the direction of a clerk of the rope-yard, and master ropemaker, in the manufactory of cables of all dimensions, for the service of the navy.

The military and civil branches of the office of ordnance, that have been established at Woolwich since the accession of George I., have occasioned a very rapid increase, both in its population and extent, particularly during the last war. The original foundry which government possessed for brass ordnance, was in Upper Moorfields, London; but its removal thence was occasioned by the following accident: a large recast being intended, of the guns which Marlborough had taken from the French, the duke of Richmond, the then master-general of the ordnance, together with several friends, and a large concourse of spectators, attended to witness the operation: previously, however, to its commencement, a foreigner in the name of Schalck, convinced, by the moisture which he observed in the moulds, that an explosion was to be apprehended, warned his Grace, and the surrounding spectators, of their danger. The event was such as he had anticipated; for no sooner had the burning metal been poured into the first mould, than it exploded with great violence, and severely injured several of the bystanders. Mr. Schalck having given so striking a proof of his skill, was offered a commission to make choice of any spot within 12 miles of London, for the erection of a new foundry, and also to be made superintendent of the whole concern. This advantageous proposal he readily accepted, and immediately began his search for a proper place for the new establishment; and having inspected various spots, he at length fixed on the Warren at Woolwich, as the most eligible situation. This arsenal is the grand national depot for every species of ordnance, both military and naval; and the immense quantity of guns which it contains, presents a curious spectacle to persons unaccustomed to sights of this nature: they are arranged in the open air, in tiers of great length, where are to be found complete field and battering train, mortars, howitzers, carronades, &c. together with the guns belonging to such of our ships of war as are not in commission. In other parts of this vast depot are extensive stores of gun carriages, military waggons, and every thing which appertains to the department of the ordnance. The arsenal includes nearly 60 acres, and contains various piles of brick building, among the oldest of which are the foundry, and the late military academy. These were erected by sir John Vanbrugh, and have the date 1719, on the upper part of the leaden pipes that convey the water from the roofs. In the foundry are three furnaces, and a machine for boring cannon: the largest furnace will melt about 17 tons of metal at one time. From the improvements that have been made in the operation of casting, all danger of explosion is avoided, the moulds being made red-hot, before the metal is suffered to run into them.

The time requisite to perform the operation of boring varies in proportion to the size of the piece, a 12 pounder taking about five days. In another quadrangular range of building, at a short distance from the foundry, are two other boring machines, and various work-shops, where the ordnance, after being proved, are properly finished for service. Brass ordnance only are made here; and these, though so called, are wholly formed of a composition of tin and copper. The foundry is under the direction of an inspector, a master founder, and an assistant founder. Nearly adjoining to the foundry is the laboratory, where fire-works and cartridges, for the use of the navy and army, are made up; and bombs, carcasses, granadoes, &c. charged. The other structures in the arsenal consist of store-houses and offices of various descriptions, together with numerous workshops, in one of which a curious planeing machine, worked by a small steam-engine, has been erected. The number of artificers, labourers, and boys, employed in the various departments, is about 3000; exclusive of the convicts belonging to one of the hulks which is stationed on the river, opposite to the arsenal: the other hulk lies before the dock-yard. The convicts amount to about 900; they are generally employed in the most laborious offices, as pile-driving, &c. under the care of proper persons.

At Woolwich, also, is situated the royal military academy, which was instituted about the year 1719; but not finally arranged till 1741. This establishment, which has varied considerably at different periods, and which has been much reduced since the peace, contains at present 100 pupils, who are called cadets.

The military academy was formerly situated in the arsenal, and the building there still serves occasionally for the reception of particular branches of the institution; but it is now removed to about a mile southward from the town, on the upper part of Woolwich common, which, with part of Charlton common, has been purchased by government within these few years. It is built in the castellated form, from designs by Wyatt; and consists, in front, of a centre and two wings, united by corridors, with a range of building behind, containing the hall, servants' offices, &c. The centre forms a quadrangle, with octagonal towers at the angles; and, besides a variety of other apartments, contains the four teaching rooms or academies, as they are termed, the masters' desks to each of which are situated in the towers, where the floor is somewhat raised above the general level. The wings contain the apartments for the cadets and chief officers, the latter being in the middle of each wing, which is more elevated than the extremities; these have octagonal turrets at the angles. The whole edifice is embattled, and built with brick, whitened over; its length is somewhat more than 200 yards; the principal front is to the north. The hall is a well proportioned room, with a timber roof, in the general style of the college halls. The entire expense of this structure is estimated at not less than 150,000*l*.

When the Warren, which was made the head-quarters of the regiment of artillery, on its being first stationed at Woolwich, became insufficient for the purpose, by the increase of the regiment, a piece of ground, of about 50 acres, was taken by government on lease, and spacious barracks erected for the accommodation of the officers and privates. It is a very extensive structure, of an oblong form, whose principal front, which faces the south, is nearly 400 yards in length. It consists of six ranges of brick building, united by an ornamental centre of stone (having Doric columns in front, and the royal arms, and military trophies, above), and four other lower buildings, filling up the divisions between each range. The latter have also stone fronts, with Doric colonnades, and a balustrade above each. These contain a library and reading-room for the officers, a mess-room, a guard-room, and a chapel; the latter of which will contain 1000 persons. At a little distance from the back part of the chapel, is a new riding-school, built of brick, from designs by Wyatt, on the model of an ancient temple. Its appearance is grand: its length is about 50 yards, its breadth 21, and its height proportionable. The whole depth of the

buildings, from the front of the barracks, which runs nearly parallel with that of the new military academy, is about 290 yards: this space includes a double quadrangle, besides various detached ranges. The regiment of artillery consisted, during the war, of nearly 17,000 men, including the horse brigade, but it is now reduced to about 7000, which are formed into nine battalions. The parade is in front of the barracks, and the soldiers are frequently exercised in throwing shells, for which the open space on the common affords sufficient room. On the east side of the barracks, on the descent leading to the arsenal, is the ordnance hospital, which is an extensive edifice, calculated to contain about 700 men. Several detached buildings, for the use of the artillery, have also been raised on different parts of the common; among which we may mention a veterinary hospital for the horse brigade; but the most conspicuous of these is a pagoda, used as a repository for models: it is 115 feet in diameter, and was removed here from Carlton-house gardens, where it served as a banquetting room to the sovereigns who visited this country, after the battle of Waterloo. On the west side of the town there are also barracks, and a handsome hospital, erected for the fourth division of marines, who have their head-quarters at this place. The population of Woolwich is reckoned at 17,000, exclusive of military.

WOOLWICH, a post township of the United States, in Lincoln county, Maine, on the Kennebeck, opposite Bath; 152 miles north-east of Boston. Population 1050.—2. A township of Gloucester county, New Jersey. Population 3063.

WOONY, a town of Hindostan, province of Berar, belonging to the Nagpore rajah. Lat. 20. 10. N. long. 78. 59. E.

WOOP, *s.* [*rubicilla*, Lat.] A bird.

WOOPERTON, a hamlet of England, in Northumberland; 6½ miles south-east of Wooler.

WOORATLA, a town of Hindostan, province of the Northern Circars. Lat. 17. 33. N. long. 82. 48. E.

WOORDAUN, a considerable town of Lower Egypt, on the western branch of the Nile, the ancient *Latopolis*.

WOORDAUN, or OWARDAN, a considerable town of Lower Egypt, situated on the western branch of the Nile. It is surrounded by sand hills and arid downs, sprinkled, however, with fine sycamore trees. This place has been noted in modern times as the resort of pirates, who, however, have now been in a great measure extirpated.

WOOS, *s.* [*alga*, Lat.] Sea-weed; an herb.

WOOSTER, a post town and capital of the United States, in Wayne county, Ohio, at the head of the navigation on the Killbuck. It is regularly laid out, and contains a bank, a land office, a printing office, and 70 houses. The Baptists have a meeting-house here; 45 miles south of Lake Erie, and 123 west of Pittsburg. Lat. 40. 46. N. Two miles north-west of the town, a well for salt water has been sunk, 280 feet deep. It furnishes very salt water in large quantities.—2. A township of Washington county, Ohio; 12 miles north-west of Marietta.

WOOTTON (John), an eminent, though not very able, painter of landscape and animals, who flourished in England about 1720. He was a pupil of John Wyck, and was much employed in the portraits of horses and dogs, and in painting the sports of the field, particularly fox-hunting; upon which subject there are seven pictures of his engraved by Canot. Once at least he attempted (but he did not frequently repeat the attempt) to pourtray a battle, and his subject was that of Culloden at the time of the rout of the rebel army. It has been engraved by Baron, though it is but an indifferent performance. He died in 1765. He had been successful in the pursuit of his art, for he was enabled by its proceeds to build a house in Cavendish-square, where he lived, and had painted it with taste, according to Walpole, who praises his works ridiculously. His prices, he says, were high, forty guineas for a single horse the size of life, and twenty if smaller.

WOOTTON, a parish of England, in Bedfordshire; 4½ miles south-west of Bedford. Population 831.—2. A township in Berkshire; 3½ miles north-west of Abingdon.—3. A

hamlet in Gloucestershire, adjacent to the city of Gloucester.—4. A parish in Kent; $8\frac{1}{2}$ miles south-east of Canterbury.—5. A parish in Lincolnshire; 5 miles south-east of Barton-upon-Flumber.—6. A parish in Northamptonshire; $2\frac{1}{2}$ miles south-by-east of Northampton. Population 455.—7. A parish in Oxfordshire; 2 miles north-by-west of Woodstock. Population 888.—8. A parish in Southamptonshire; 4 miles north-east of Newport.—9. A township in Staffordshire; 8 miles north-by-east of Uttoxeter.—10. A parish in Surrey; 3 miles west-by-south of Dorking. Population 488.

WOOTTON-BASSET, an ancient borough and market-town of England, in the county of Wilts, consists chiefly of one street, about half a mile in length. Two representatives have been regularly deputed from this town to serve in parliament, since the 25th year of the reign of Henry VI. They are elected by the inhabitant householders, legally settled there, and paying scot and lot. The corporation is composed of a mayor, two aldermen, and 12 burgesses. The market-day is Tuesday, weekly; and there are six annual fairs. In the centre of the town is a market-house and shambles; and near this stands the town-hall, in which a machine, called a "cucking, or ducking stool," formerly used for the punishment of female scolds, was preserved.

In this parish are two free schools, and a Sunday school. The former were founded and endowed by the earl of Clarendon, one of them for 12 boys, and the other for 12 girls. This town is 89 miles west from London. About 3 miles north-east of the town is Lediard-Tregose, the seat of lord viscount Bolingbroke. The house contains some curious pictures; and in the adjoining church are several fine monuments to different branches of the St. John family.

WOOTTON, COURTNEY, a parish of England, in Somersetshire; 4 miles from Minehead. Population 372.

WOOTTON-UNDER-EDGE, a borough and market-town of England, in the county of Gloucester, is seated at the foot of a ridge of woody hills, from which situation its name has undoubtedly been derived. The old town was burnt down in the reign of king John, and a place called the Brands is supposed to mark its original site. The town is well built, and has a handsome church, the tower of which is adorned with battlements and pinnacles: in it are several handsome monuments of the Berkeley family. Here is a free school, founded in 1385, by lady Catherine Berkeley. It has also alms-houses for six poor men, and as many women. In the town and neighbourhood are several clothing manufactories, one of which often employs at least 200 persons. The government of the town is vested in a mayor, who is chosen annually at the court leet of the earl of Berkeley, and 12 aldermen. Market on Friday, and a fair on the 25th September. Population 1527 persons, occupying 217 houses; 19 miles south-south-west of Gloucester, and 108 west-by-north of London.

WOOTTON FITZPAINE, a parish of England, in Dorsetshire; 4 miles from Lyme. Population 328.

WOOTTON GLANVILLE, a parish of England, in Dorsetshire; $7\frac{1}{2}$ miles south-south-east of Sherborne.

WOOTTON ST. LAWRENCE, a parish of England, in Southamptonshire; 3 miles west-by-north of Basingstoke. Population 511.

WOOTTON, NORTH, three parishes of England, one in Dorsetshire, one in Norfolk, and one in Somersetshire.

WOOTTON RIVERS, a parish of England, in Wiltshire; 3 miles north-east of Pewsey.

WOOTTON, SOUTH, a parish of England, in Norfolk; 2 miles south of Castle Rising.

WOOTTON UNDERWOOD, a parish of England, in Berkshire; 8 miles from Aylesbury.

WOOTTON, WAWEN or WAVEN, a parish of England, in Warwickshire. Population 572.

WORB, a large village in the west of Switzerland; 6 miles east-by south of Bern.

WORBIS, or STADT WORBIS, a town of Prussian Saxony, in the Lower Eichsfeld, on the Wipper. Population 1400.

WORCESTER, an inland county of England, very near

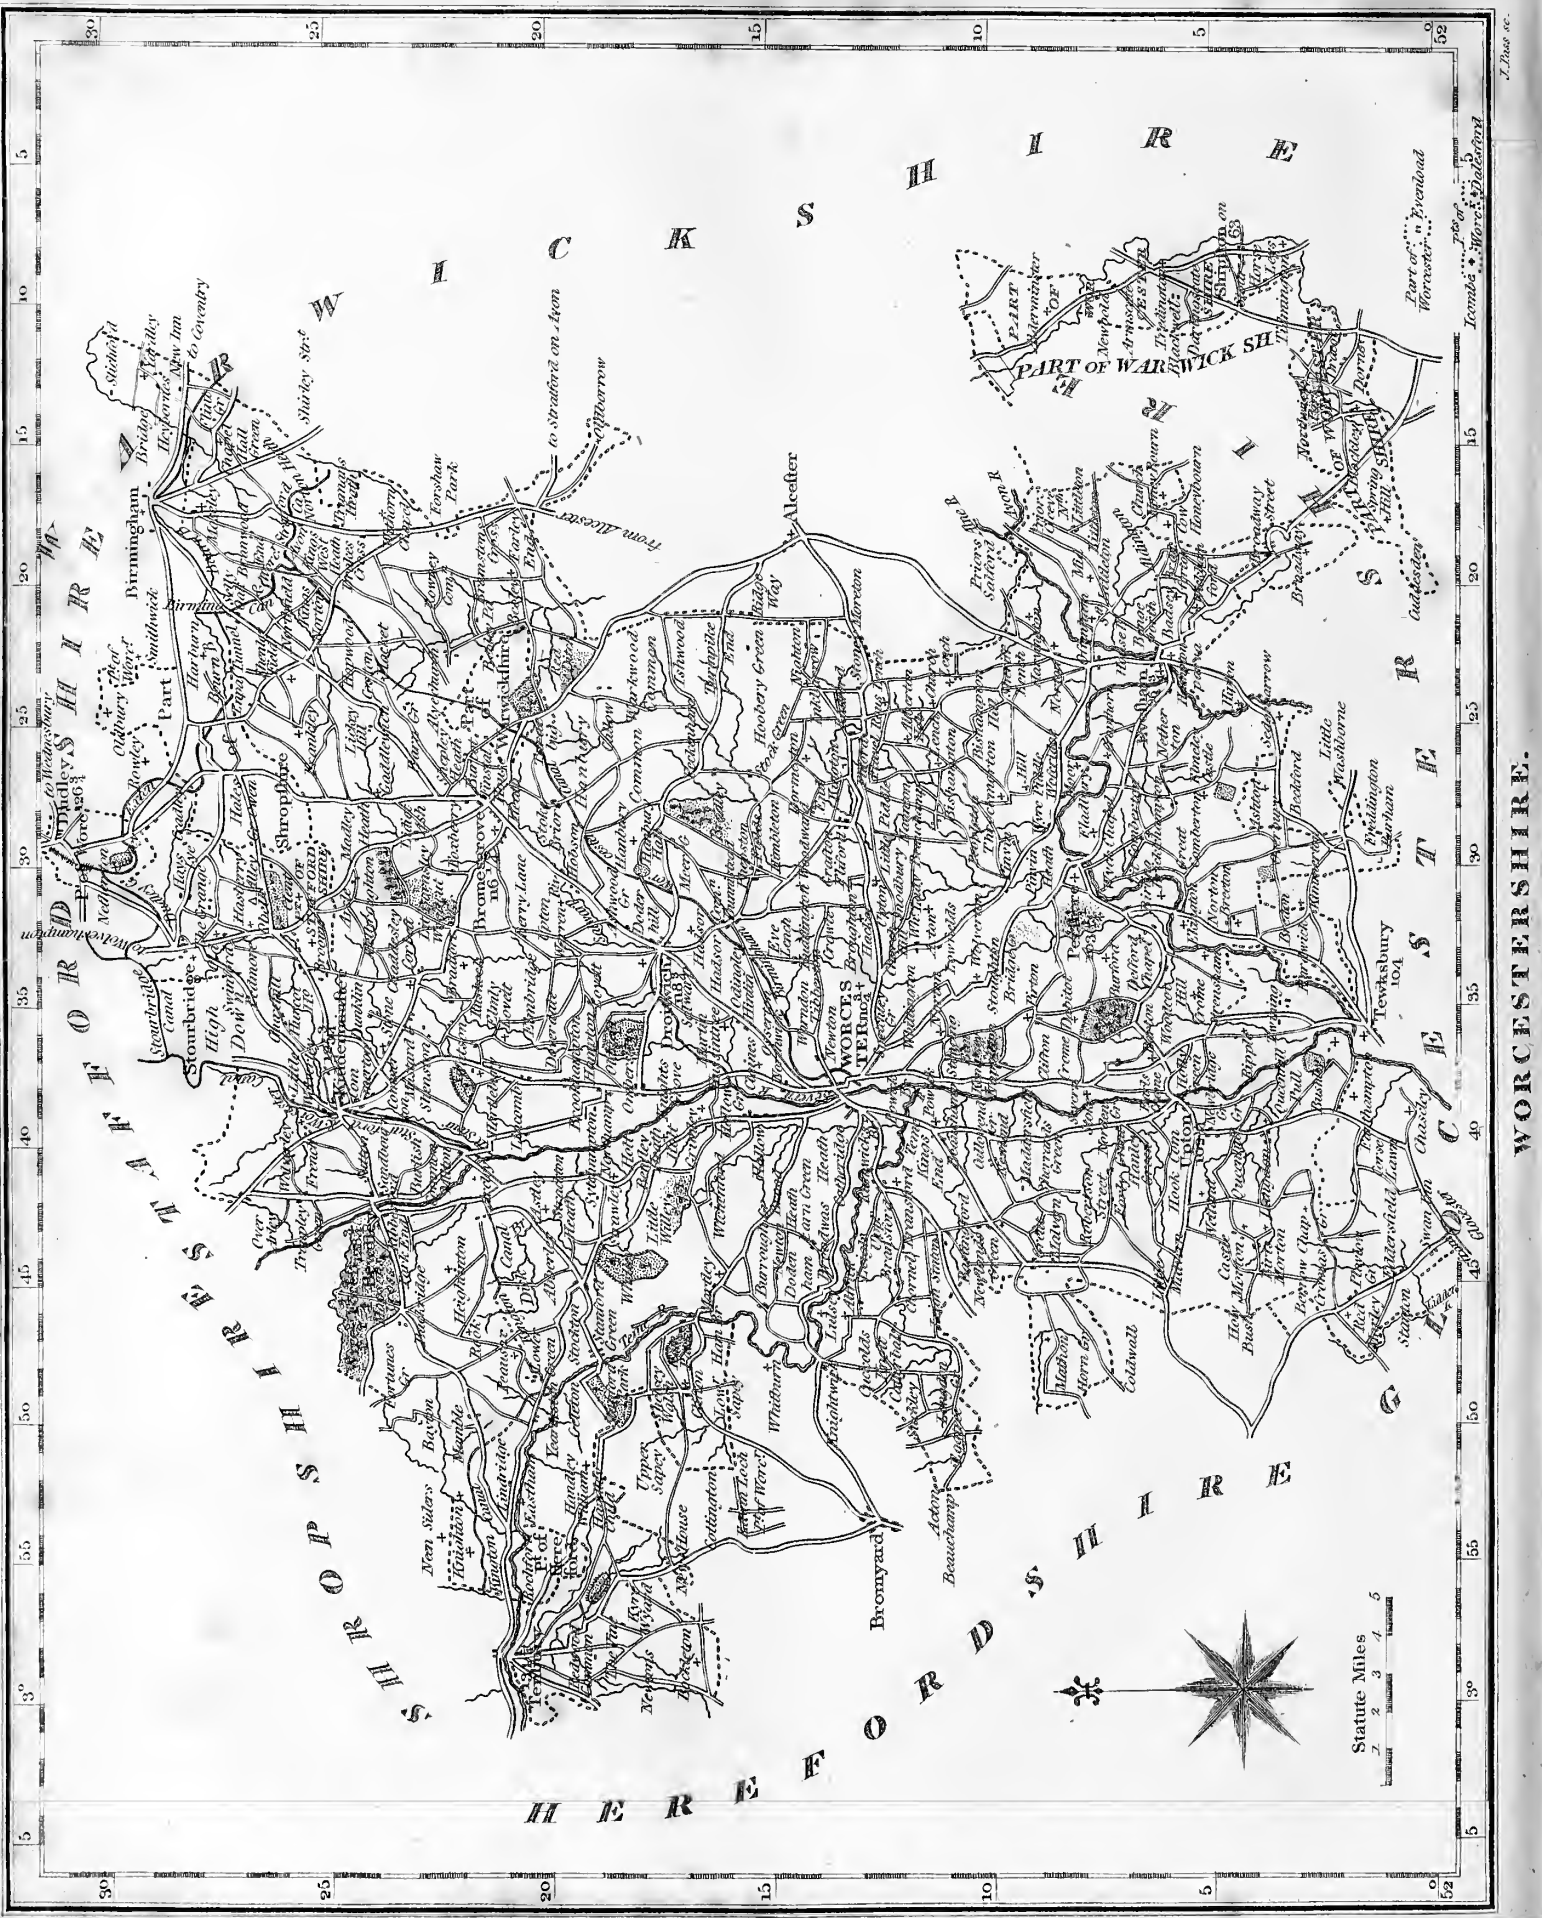

the centre of the kingdom, with Herefordshire separating it from Wales on the south-west; Shropshire lying to the north-west; Staffordshire bounding it on the north; Warwickshire stretching to the east; and Gloucestershire on the south. In longitude it extends from 1. 30. to 2. 30. W.; and its latitude is from 52. to 52. 30. N. It is altogether of a very irregular shape, having on every side detached parts surrounded by other counties, and in some instances, parts of other counties completely insulated within it: and though its circumference, not allowing for irregularities, cannot be estimated at more than 124 miles, yet, if the boundary line was to be precisely measured, it would be nearly twice that computation. The estimates of its superficial contents by the different topographical writers, vary extremely. Its medium length is stated by some to be 36 miles, and its breadth 34 miles. From this it is computed that the body of the county contains 936 square miles, equal to 599,040 acres; whilst the detached parts being estimated at 19,200, the whole is stated to amount to 618,240 acres. According to other estimates, again, the mean length is said to be 30, and the breadth 25 miles, giving a superficies of 480,000 acres; but the official estimate laid before parliament reduces its contents to 431,360 acres. Without deciding between these different accounts, it may be stated that, at the present day, it contains one city, 11 market towns, perhaps 300 villages and hamlets (some accounts say 500), and 152 parishes, including one bishopric and three boroughs: the whole being divided into five hundreds, viz. Oswaldeslowe, Halfshire, Blakenhurst, Pershore, and Doddingtree. Its towns, besides the city of Worcester, are, Evesham, Droitwich, and Bewdley, which return members to parliament; and the market towns of Upton, Tenbury, Kidderminster, Dudley, Stourbridge, Bromsgrove, Pershore, and Shipston-upon-Stour.

The general aspect of the country is rich and beautiful. When viewed from any of the numerous eminences in the surrounding counties, it rather approaches to a plain, the gentle slopes and risings to the east and west of Worcester, remaining scarcely any longer discernible.

The air is generally pure and mild, though in some parts, as on the north-west range of the Broadway hills, there is a degree of wild bleakness that reminds the traveller very much of the mountainous tracts of Derbyshire. Bredon hill, and others in its vicinity, are also of considerable height, and are seen at a great distance. These are estimated to be 800 or 900 feet above the level of the Avon, and are rather of a cold temperature. Amongst the inclement parts of the county, comparatively speaking, we ought also perhaps to include the Lickey, which rises to the north-east of Bromsgrove, in a ridge of high hills, and runs towards Hagley, to the north, diverging also to the east; some of its peaks having an elevation of 800 or 900 feet above the general level. This district, however, is by no means so bleak as the Broadway hills, though farther to the northward. The Malvern hills, though nothing more than sheep-walks, have yet a most salubrious climate; and the north-western parts of the county, particularly about Abberley, though of equal elevation to any other district, seem to have a much warmer aspect than either the Lickey or Broadway hills, which may perhaps, in a great degree, be owing to the shelter of the woods and other plantations which are so frequent there. In the middle, south, and western parts of the county, the climate is described as remarkably mild, soft, and salubrious. The vale of Severn, but little elevated above the level of the sea, and the valleys of the Avon and Teme, nearly upon the same level with the adjoining uplands, seldom rising above 100, or at most 150 feet above their level, have at this low elevation a warmth and softness which ripens the grain, and brings to perfection the produce of the earth, from a fortnight to a month earlier than in more elevated countries.

The soil is various, consisting chiefly of rich loamy sand, in those districts immediately north of Worcester, mixed with a small proportion of gravel: this, however, relates principally to the central part of the county; for there is some

SHROPSHIRE

WORCESTERSHIRE.

Printed for the Editor, opposite the London Office.

some very light sand, with a few spots of clay, and some of peat earth, towards the east. In the eastern district, indeed, the soil is in general a strong clay: but the waste land, which at one time was very considerable, was principally of deep, black, peat earth. Between Worcester and the vale of Evesham, the soil is partly red marl, and partly strong clay, with some sandy loam; and there is also a small vein of land, which partakes of each of these qualities; whilst the sub-soil, more especially under the sandy loam, consists of lime-stone. In the vale itself the soil is particularly deep; of a darkish coloured earth, with a substratum, in many parts, of clay, and some gravel. Beyond this, on the confines of the county, and in the small detached parts, including a small part of the Cotswold hills that runs into this county, a limestone prevails on the upper land, and a rich loam in the lower. Between Worcester and Malvern, the general character of the soil is a clay, mixed with gravel in different proportions. To the left of this line, including Malvern Chace, a deep surface of clay is found in some places; in others, a rich loam, inclining to sand; the substratum is supposed to be marl. In the central parts of the western district, a strong clay is sometimes found, becoming gradually gravelly towards the light sands in the north. In each of these districts, some rocky and stony soil is met with; but no traces of flint or chalk. The vale of Severn is described as containing probably 10,000 acres of a deep and rich sediment, deposited from time immemorial, by the waters of this river, and by its tributary streams. This sediment in some places consists of a pure water clay, adapted for brick-making, but generally of a rich mud, fertile, and favourable to vegetation.

As to the mineralogy of this county, little can be said; for, as in all the other fertile counties in England, little is to be found under the surface, where the external produce is so luxuriant.

On Burlish common is a well called the Dropping Well, which is considered as excellent for the cure of weak eyes; and several cases are well attested of its successful application. The canals in this county are, 1st, the Trent and Severn, or Staffordshire and Worcestershire, or as, indeed, it is more commonly called, the Stourport canal; 2d, the Droitwich canal; 3d, the Worcester and Birmingham canal; 4th, the Dudley Extension canal; 5th, the Leominster canal, near Tenbury. Its principal rivers are the Severn, Avon, Stour, and Teme; the Severn enters the county from Shropshire, runs through its whole length, and being joined by the Teme from the north-west, the small river Salwarp from the north-east, the Stour from the north, and the Avon from the south-east, renders the soil extremely fertile. The commerce and manufactures are very considerable, not only from its own produce, but from its lying in a situation to make it the depot and line of communication for the mining and manufacturing counties which almost surround it. Of its own exported produce, we may enumerate the great quantities of hops, fruit, cyder, and perry, which are bought at Worcester markets, rendering it the great mart for those articles in the western district of the kingdom. This county also exports a considerable surplus of its own manufactures, in the article of Kidderminster goods, Worcester gloves, in China and glass-ware, and in nails, and the smaller articles of iron-work, as well as barred and sheet-iron, for the northern parts. We must not omit the great quantities of salt from Droitwich, of oil and oil-cake from Evesham, and of clover and grass-seeds, corn, beans, flour, malt, salmon, fat cattle, sheep, lambs, hogs, hay, timber, large and small, from the county in general.

That Worcestershire was known to the Romans, the roads whose vestiges are discovered to run through the county, afford convincing proofs. Several coins also of the lower empire have been found, particularly in the fields adjoining to the large camp on Witchbury hill, where about 40 years ago an earthen pot filled with them, was taken out of a pool on the side of the hill. Besides these, urns have been found filled with bones, and various other vestiges of the ancient conquerors of Britain.

The county contains 30,462 houses, inhabited by 160,546 persons; viz. 78,033 males, and 82,513 females; of whom 16,855 families were returned as being employed in trade, handicraft, and manufactures, 13,818 in agriculture, and 3441 others.

WORCESTER is the chief town of the above county, and one of the most ancient cities in England. It is agreeably situated in a beautiful vale on the eastern banks of the Severn, from which it rises gradually. Its air and climate are remarkably healthy, and the surrounding country is not only deserving of notice from its fertility and variety of prospect, but from the pleasing effect produced by its beautiful, and often romantic, outline. From the eastern blasts it is comfortably screened by a hill, covered with some fine woods, which add much to the beauty of the scenery; whilst being open from north to south, in the direction of the river, a brisk current of air generally prevails, which is exceedingly conducive to health. Being an ancient fortified place, this city had a very strong wall, of which some remains may yet be seen at the back of the commandery, in which were six ports or gates, said to have been handsome, but which have been taken down some years ago; and however the antiquary may regret this, yet it must be acknowledged, that it has tended much to improve the principal entrances into the city. The streets are in general broad, so as to admit a free circulation of air. They are also well paved and lighted. The Foregate-street, the High-street, the Broad-street, and Bridge-street, are exceedingly regular and beautiful. The other streets, however, are not remarkable either for airiness or regularity. The cathedral is a noble specimen of Gothic simplicity; the outside is extremely plain, and devoid of all laboured ornaments. Its beauty consists in its height, space, and the lightness of its architecture, which is greatly aided by the lofty pinnacles rising from every termination of the building. The cathedral was first erected by Ethelred, king of Mercia, in 680, when it was a convent of secular priests. It was burnt down and rebuilt before the conquest, and was again reduced to ashes in 1113. It was again burnt down in 1202, with all the adjacent offices of the monastery, and part of the city; but being again rebuilt, and king John buried there, it was, in the presence of Henry III. his son, and of many bishops, abbots, and nobles, solemnly consecrated in 1218. After this, a general repair took place, and a complete new front was given to it. The greatest part of the buildings, consisting of the hall, refectory, cloister, water-gate, &c., were all built between 1320 and 1336, by bishop Wakefield, who also lengthened the body of the church (the north aisle having previously been vaulted by bishop Cobham), by adding two arches to the west end; he is recorded also to have built the north porch, an elegant specimen of the architecture of the times. From this period until the unhappy contest of Charles and the parliament, no particular alterations were made; but great dilapidations took place, while the place was occupied by the parliamentary forces. These have been in a great measure repaired, particularly of late years, when great improvements have been made, not only in the exterior architecture, but in the interior regulations and arrangements. After all the damages which it has suffered, and notwithstanding the unavoidable varieties of architecture which have taken place, this memorable cathedral is now an object of great interest to the man of taste. Its form is that usual one of a double cross, displaying the grand features of the Gothic style, which consist in extent and strength, and to which we may add the solemnity of the high pointed arch, and the beauty of diminutive ornament. The proportions of the exterior are on a grand scale; it is in length 514 feet; in breadth 78; and in height 68; and the tower, which rises from the centre of the cross aisle to the altitude of 200 feet, is ornamented at the corners by four lofty pinnacles, and with elegant battlements of light open work. This tower has been reckoned heavy, particularly in the upper tier of ornamented windows. Much curious work may be seen on its various sides, as well as some ancient statues: these are, the Virgin with the infant Christ, St. Walsten, St. Oswald, and other religious

religious worthies of the days of old. The whole of the interior is highly interesting, not only from the singularity as well as beauty of its architecture, but also from the numerous monuments erected to many eminent characters. On entering through the beautiful north porch, the great nave and side aisles present a most elegant admixture of the Anglo-Norman and Gothic orders; the two western arches added by bishop Giffard being of the former, whilst the remaining seven are of the latter; and the visitor will be struck with the beauty of the ornamented capitals of the pillars that support them, being sculptured with the nicest filagree work, each differing from the other, though it is to be lamented, that these have in some places been destroyed, during the occupation of the edifice by the parliamentary army. The effect produced by the modern painted windows, contrasted with the pure white of the walls, is also very striking. In the interior are many elegant monuments of distinguished persons and families. Nothing can be imagined more august, and yet more simple, than the choir, in which the best effect is produced by its clustered pillars, the exquisite open worked mouldings of its pointed arches, and its general arrangement. The stalls in the choir, which are in the best state of repair, are of Irish oak, as old as 1397; the carvings are well done, and the turn-up seats are, as usual in old cathedrals, ornamented on the reverse with ludicrous, satirical representations, emblematical of the mendicant orders of friars, between whom, and the lazy inmates of the cloister, there was perpetual war. The effect of the east window over the altar is very fine; and the octagonal pulpit deserves attention; of this the front and sides are of stone, and the back of curious oak, and the whole is curiously carved with emblems of the past and present dispensations, a representation of the New Jerusalem, the evangelic hieroglyphics, &c. The altar-piece is a simple screen, constructed of oak, but rather inappropriately ornamented with Corinthian pillars; the centre has a painting of the "Descent from the Cross." Opposite to the pulpit is the bishop's throne, which is a specimen of very antique workmanship, with the olive branch, as an emblem of peace, and some other symbols, such as the mitre, &c. designative of the episcopal functions. The organ, which stands over the western entrance, is possessed of a very fine tone, and is supposed to excel all others in the kingdom in the trumpet stop. The attention of the spectator, in passing up to the altar, is arrested by an altar-tomb in the centre, and near to the east end. This is the tomb of king John, the most ancient one that is existing, in England at least, of all the ancestors of the present royal family, since the time of the conquest. His effigy lies on the tomb, crowned; on which was written, but now almost illegible, "*Johannes Rex Angliæ.*"

The trade of Worcester is very considerable, arising not only from the surplus products of the county and its own manufactures, but from the great conveniences resulting from its very extended water carriage. Worcester formerly excelled in the manufacture of broad cloths; also of carpets; both which manufactures have been given up. The porcelain manufacture is carried on to a great extent, and has reached the highest perfection. The glove manufactory is also deserving of notice, as it is conducted on a very extensive scale, both for home consumption and exportation, those of Worcester and its vicinity being much admired. The present corporation, by charter of James I., consists of a mayor, recorder, sheriff, six aldermen, 24 common councilmen, and 48 assistants; and sends two members to parliament, chosen by the citizens admitted to their freedom by birth or servitude, or by redemption: the number of voters is about 1700, and the returning officer is the sheriff. This city suffered much during the wars between the houses of York and Lancaster; but the most remarkable event here was the famous battle between the English army under Cromwell, and the Scotch, in the cause of Charles II. in 1650, when the royalists had 2000 killed and 8000 taken prisoners, most of whom were sold as slaves to the American colonies. After this, Cromwell ordered the walls of the city to be razed to the ground. This city gives title of

marquis to the duke of Beaufort. The market days are on Wednesdays, Fridays, and Saturdays, and the markets well supplied with every kind of provision. The following are toll free: second Monday in February, and the first Monday in May, June, July, and November. Its fairs are the Saturday before Palm Sunday, Saturday in Easter week, 15th August, 19th September, and the first Monday in December; 111 miles north-west-by-west of London.

WORCESTER, a county of the United States, in Massachusetts, bounded north by New Hampshire, east by Middlesex and Norfolk counties, south by Rhode Island and Connecticut, and west by Hampden, Hampshire, and Franklin counties. Population 64,910.—2. A post town of the United States, and capital of Worcester county, Massachusetts. In 1791, two editions of the bible, one in large folio, the other in royal quarto, the first of the kind published in America, were printed in this town. Population 2577; 39 miles north-north-west of Providence, and 40 west-by-south of Boston.—3. A post township of the United States, in Otsego county, New York. Population 1140.—4. A post township of Montgomery county, Pennsylvania. Population 868.—5. A county of the United States, in Maryland, bounded north by Delaware, east by the Atlantic, south by Virginia, and west by Somerset county. Population 16,971. Chief town, Snowhill.—6. A township of the United States, in Washington county, Ohio. Population 385.

WORD, *s.* [pɔpɪ, Saxon; *woord*, Dutch; *ward*, M. Goth.] A single part of speech.—If you speak three *words*, it will three times report you the three *words*. Bacon.—A short discourse.

Shall I vouchsafe your worship a *word* or two?

—Two thousand, and I'll vouchsafe thee the hearing.

Shakspeare.

Talk; discourse.

Why should calamity be full of *words*?

—Let them have scope, though what they do impart

Help nothing else, yet they do ease the heart. *Shakspeare.*

Dispute; verbal contention.

In argument upon a case,

Some *words* there grew 'twixt Somerset and me. *Shakspeare.*

Language; oral expression; living speech.—Found you no displeasure by *word* or countenance? *Shakspeare.*

Promise.—Obey thy parents, keep thy *word* justly, swear not. *Shakspeare.*—Signal; token; order.

Every soldier, kill his prisoners;

Give the *word* through.

Shakspeare.

Account; tidings; message.

Bring me *word* thither

How the world goes, that to the pace of it

I may spur on my journey.

Shakspeare.

Declaration; purpose expressed.

I know you brave, and take you at your *word*;

That present service which you vaunt, afford.

Dryden.

Affirmation.—I desire not the reader should take my *word*, and therefore I will set two of their discourses in the same light for every man to judge. *Dryden.*—Scripture; word of God.—They say this church of England neither hath the *word* purely preached, nor the sacraments sincerely ministered. *Whitgift.*—The second person of the ever adorable Trinity. A scripture term.

Thou my *Word*, begotten Son, by thee

This I perform.

Milton.

A motto; a short sentence; a proverb.

Round about the wreath this *word* was writ,

"Burnt I do burne."

Spenser.

To WORD, *v. n.* To dispute.—He that descends not to *word* it with a shrew, does worse than beat her. *L'Es-trange.*

To WORD, *v. a.* To express in proper words.—The apology for the king is the same, but *worded* with greater deference to that great prince. *Addison.*—To affect by many words;

words; to overpower by words.—If one were to be *worded* to death, Italian is the fittest language. *Howell.*

WORD, a town of Bavarian Franconia, properly one of the suburbs of Nuremberg. It contains 1800 inhabitants.

WORD, a small town in the north-east of France, in Alsace. Population 1000.

WORDCATCHER, *s.* One who cavils at words.

Each wight who reads not, and but scans and spells,
Each *word-catcher* that lives on syllables. *Pope.*

WORDER, *s.* One who uses words; a speaker.—We could not say as much of our high *worders*. *Whitlock.*

WORDINESS, *s.* State or quality of abounding with words. *Ash.*

WORDINGBERG, a petty seaport of Denmark, on the south coast of the island of Zealand.

WORDISH, *adj.* Respecting words.—What I have hitherto said in these *wordish* testimonies. *Hammond.*

WORDISHNESS, *s.* Manner of wording or expression.—The truth they hide by their dark *wordishness*. *Verses.*

WORDLESS, *adj.* Silent; without words.

Her joy with heav'd-up hands she doth express,
And, *wordless*, so greets heaven for his success. *Shakspeare.*

WORDSFIELD, a hamlet of England, in Worcestershire, near Upton-upon-Severn.

WORDWELL, a parish of England, in Suffolk; $5\frac{1}{2}$ miles from St. Edmund's Bury.

WORDY, *adj.* Verbose; full of words.

We need not lavish hours in *wordy* periods,
As do the Romans, ere they dare to fight. *Philips.*

WORE. The preterite of *wear*.

This on his helmet *wore* a lady's glove,
And that a sleeve embroider'd by his love. *Dryden.*

WORE, a township of England, in Salop; $7\frac{1}{2}$ miles north-north-east of Drayton-in-Hales.

WORFIELD, a parish of England, in Salop, near Bridgnorth. Population 1339.

WORGAN (Dr. John), a musical graduate of Oxford, organist of St. Mary-Axe, Bedford chapel, and many years a distinguished performer on the organ at Vauxhall, and Dr. Arne's successor there in the composition of cantatas, songs, and ballads.

He learned the rudiments of music of his elder brother, who had likewise an organist's place in the city, and played the violoncello in the Vauxhall band. Their scholars on the harpsichord were very numerous, particularly within Temple-bar; and John, as an organist and opener of new organs, rivalled Stanley. He was a very studious man, and dipt very early into the old ecclesiastical composers of Italy. He succeeded Gladwin in playing the organ at Vauxhall. His first study in composition and organ-playing was directed by Roseingrave, who pointed his attention to the pure harmony and modulation of Palestrina, and organ-fugues of Handel. His constant use of the organ at Vauxhall, during the summer, ranked him with Stanley and Keeble; and his enthusiasm for Scarlatti's lessons, with which he was impressed by Roseingrave, rendered him equal to Kelway in their execution.

With an extempore prelude, *alla Palestrina*, and one of Handel's organ-fugues, he used to preface his concerto every night.

At length he got acquainted with Geminiani, swore by no other divinity, and on consulting him on the subject of composition, he was told that he would never be acquainted with all the arcana of the science, without reading "El Porque della Musica," a book written in Spanish per Andres Lorente, en Alcalá, 1672. But where was this book to be had? Geminiani told him, and told him truly, that the tract was very scarce. He had, indeed, a copy of it himself; but he would not part with it under twenty guineas. Worgan, on fire to be in possession of this oracular author, immediately purchased the book at the price mentioned; not understanding a word of Spanish, he went to work in learning it. But the knowledge of Spanish and study of Lorente seem

to have had no other effect on Worgan's compositions, than to spoil his Vauxhall songs; which though sung into popularity by dint of repetition, had no attractive grace, or pleasing cast of melody.

He composed several oratorios, in which the choruses are learned, and the accompaniments to his songs ingenious. The *cantilena* was original, it is true, but it was original awkwardness, and attempts at novelty without nature for his guide.

His organ-playing, though more in the style of Handel than of any other school, was indeed learned and masterly, in a way quite his own. In his youth, he was impressed with a reverence for Domenico Scarlatti by old Roseingrave's account of his wonderful performance on the harpsichord, as well as by his lessons; and afterwards he became a great collector of his pieces, some of which he had been honoured with from Madrid by the author himself. He was the editor of twelve at one time, and six at another, that are admirable, though few have now perseverance sufficient to vanquish their peculiar difficulties of execution. He was in possession of many more, which he always locked up as Sybil's leaves.

He had the misfortune to labour under two dreadful calamities; a bad wife, and the stone. He got rid of the former, after great mortifications and expense, by divorce; but in too early wishing to abridge his sufferings from the latter, he lost his life in the torture of an operation, August 20, 1790.

WORGAM, a town of Hindostan, province of Aurangabad. It is situated 20 miles west of Poona, and is celebrated for being the scene of the disgraceful treaty made by the Bombay commissioners with the Mahrattas, in 1778.

WORGEL, a large village of the Austrian states, in Tyrol, on the Inn.

WORINGEN, a small town of the Prussian states, on the Rhine. Population 1400.

To WORK, *v. n.* pret. *worked*, or *wrought*. [*peopcan*, Sax.; *werken*, Dutch; *waurkian*, M. Goth.] To labour; to travail; to toil.

Good Kent, how shall I live and *work*
To match thy goodness? life will be too short. *Shakspeare.*

To be in action; to be in motion.
In Morat your hopes a crown design'd
And all the woman *work'd* within your mind. *Dryden.*

To act; to carry on operations.
Our better part remains
To *work* in close design. *Milton.*

To operate as a manufacturer.—They that *work* in fine flax. *Isaiah*.—To ferment.—Into wine and strong beer put some like substances, while they *work*, which may make them fume and inflame less. *Bacon*.—To operate; to have effect.

With some other business put the king
From these sad thoughts that *work* too much upon him. *Shakspeare.*

To obtain diligence.
Without the king's assent
You *wrought* to be a legate. *Shakspeare.*

To act internally; to operate as a purge, or other physic.
Work on,
My medicine, *work!* thus credulous fools are caught. *Shakspeare.*

To act as on a subject.—Natural philosophy has sensible objects to *work* upon; but then it often puzzles the reader with the intricacy of its notions. *Addison*.—To make way.
Who would trust chance, since all men have the seeds
Of good and ill, which should *work* upward first? *Dryden.*

To be tossed or agitated.
Vex'd by wintry storms, Benacus raves,
Confus'd with *working* sands and rolling waves. *Addison.*

To WORK, *v. a.* preter. and participle pass. *worked*, or *wrought*.—To labour; to manufacture; to form by labour.—The industry of the people *works* up all their native commodities

modities to the last degree of manufacture. *Swift*.—To bring by action into any state.

So the pure limpid stream, when foul with stains
Of rushing torrents and descending rains,
Works itself clear, and, as it runs, refines,
Till by degrees the floating mirror shines. *Addison*.

To influence by successive impulses.
To hasten his destruction, come yourself,
And *work* your royal father to his ruin. *A. Philips*.

To make by gradual labour, and continued violence.—
Sidelong he *works* his way. *Milton*.—To produce by labour; to effect.

Of the tree,
Which, tasted, *works* knowledge of good and evil,
Thou may'st not: in the day thou eat'st, thou dy'st. *Milton*.

To manage; in a state of motion; to put into motion.—
Mere personal valour could not supply want of knowledge in building and *working* ships. *Arbutnot*.—To put to labour; to exert.

Now, Marcus, thy virtue's on the proof;
Put forth thy utmost strength, *work* every nerve,
And call up all thy father in thy soul. *Addison*.

To embroider with a needle: as, she *worked* an apron.—
I *worked* a violet leaf. *Spectator*.

To *WORK out*. To effect by toil.—The mind takes the hint from the poet, and *works out* the rest by the strength of her own faculties. *Addison*.

To *WORK out*. To erase; to efface.
Tears of joy for your returning spilt,
Work out and expiate our former guilt. *Dryden*.

To *WORK up*. To raise.—That which is wanting to *work up* the pity to a greater height, was not afforded me by the story. *Dryden*.

To *WORK up*. To expend in any work, as materials.
WORK, *s*. [people, Sax.; *werk*, Dutch.] Toil; labour; employment.

The ground, unbid, gives more than we can ask;
But *work* is pleasure, when we chuse our task. *Dryden*.

A state of labour.—All the world is perpetually at *work*, only that our poor mortal lives should pass the happier for that little time we possess them, or else end the better when we lose them: upon this occasion riches came to be coveted, honours esteemed, friendship pursued, and virtues admired. *Temple*.—Bungling attempt.—It is pleasant to see what *work* our adversaries make with this innocent canon; sometimes 'tis a mere forgery of heretics, and sometimes the bishops that met there were not so wise as they should have been. *Stillingfleet*.—Flowers or embroidery of the needle.—That handkerchief, you gave me: I must take out the *work*: a likely piece of work, that you should find it in your chamber, and know not who left it there. This is some minx's token, and I must take out the *work*. There, give it your hobby-horse; wheresoever you had it, I'll take out no *work* on't *Shakspeare*.—Any fabric or compages of art.

Nor was the *work* impair'd by storms alone,
But felt the approaches of too warm a sun. *Pope*.

Action; feat; deed.
Nothing lovelier can be found in woman,
Than good *works* in her husband to promote. *Milton*.

Any thing made.
O fairest of creation! last and best
Of all God's *works*! creature, in whom excels
Whatever can to sight or thought be form'd;
Holy, divine, good, amiable, or sweet,
How art thou lost! *Milton*.

Operation—As to the composition or dissolution of mixt bodies, which is the chief *work* of elements, and requires an intire application of the agents, water hath the principality and excess over earth. *Digby*.—Effect; consequence of agency.

Fancy
Wild *work* produces oft and most in dreams. *Milton*.

Management; treatment.—Let him alone; I'll go another way to *work* with him. *Shakspeare*.

To set on *WORK*. To employ; to engage.—It setteth those wits on *work* in better things, which would be else employed in worse. *Hooker*.

WORKER, *s*. Whoever or whatever works.
Ye fair nymphs, which often times have loved
The cruel *worker* of your kindly smarts,
Prepare yourselves, and open wide your hearts. *Spenser*.

WORKFELLOW, *s*. One engaged in the same work with another.—Timotheus, my *workfellow*, and Lucius, salute you. *Rom*.

WORKFOLK, *s*. Persons employed in working.
Thou shalt—oversee my *work-folks*,
And at the week's end pay them all their wages. *Beaum. and Fl.*

WORKHOUSE, or *WORKINGHOUSE*, *s*. A place in which any manufacture is carried on.—The quick forge and *workinghouse* of thought. *Shakspeare*.—A place where idlers and vagabonds are condemned to labour.—Hast thou suffered at any time by vagabonds and pilferers? Esteem and promote those useful charities which remove such pests into prisons and *workhouses*. *Atterbury*.

WORKING, *s*. Motion; operation.
Glory grows guilty of detested crimes,
When for fame's sake
We bend to that the *working* of the heart. *Shakspeare*.

We see the *workings* of gratitude in the Israelites. *South*.
—Fermentation.—Staying the *working* of beer. *Bacon*.

WORKINGDAY, *s*. Day on which labour is permitted; not the sabbath: it therefore is taken for coarse and common.—How full of briars is this *workingday* world? *Shakspeare*.

WORKINGTON, a seaport and market town of England, in Cumberland, which is situated near where the Derwent and Cocker fall into the ocean. Many of the streets are narrow and irregular; but some are elegant and neat; and, upon the whole, this town is more agreeable than most ports of equal size in the kingdom. Though it seems to have been anciently the chief haven in Cumberland, yet it appears, that in 1566 only one vessel belonging thereto was of so great a burden as ten tons; and, on a survey taken of the maritime strength of the county, about 20 years after that period, when England commanded the seas, all the vessels which Cumberland could put to sea amounted only to 10 in number, and their mariners to 198. Workington has increased rapidly of late years, and many handsome buildings have been erected. The coal trade to Ireland is its chief support. A few vessels are, however, employed in the Baltic trade. The imports are timber, bar-iron, and flax. The river is navigable for ships of 400 tons burden: and the harbour is commodious, and extremely safe from all winds. There are now about 160 vessels belonging to this port; upon an average, of about 130 tons each. The principal manufactories are of sail-cloth and cordage. The public buildings are modern. Not far from the town, a spacious workhouse, for the reception and support of the poor, was erected a few years ago, which cost the inhabitants 1600*l.*, and is calculated to contain 150 persons. A considerable salmon fishery on this river belongs to lord Lonsdale. The collieries in the vicinity of Workington, which are numerous and valuable, belong to Mr. Curwen, who ships from thence about 150 waggons per day (Sundays excepted), each waggon containing three English tons of coals. Several steam-engines are employed in these coal-works, and between 500 and 600 men. The manor-house of the family of Curwen stands upon a fine eminence on the banks of the Derwent. It is an elegant quadrangular building, surrounded with excellent lands, in a fine state of cultivation. The house commands a prospect of the town, the river, and its northern banks, and the western ocean for a considerable tract. There is a school on the
Lancasterian

Lancasterian plan, at which are taught 220 boys. There is also a female seminary, at which there are 90 girls. A little above Workington are those large works called Seaton iron-works, which give bread to several hundreds of industrious mechanics; 34 miles south-west-by-west from Carlisle, and 310 north-west-by-north from London. Population 5807.

WORKMAN, *s.* An artificer; a maker of any thing.

When *workmen* strive to do better than well,
They do confound their skill in covetousness. *Shakspeare.*

WORKMANLIKE, *adj.* Skilful; well performed.

The gardener—

Their selected plants doth, *workmanlike*, bestow. *Drayton.*

WORKMANLY, *adj.* Skilful; well performed; workmanlike.

WORKMANLY, *adv.* Skilfully; in a manner becoming a workman.

We will fetch thee straight

Daphne roaming through a thorny wood,
Scratching her legs, that one shall swear she bleeds,
And at that sight shall sad Apollo weep,
So *workmanly* the blood and tears are drawn. *Shakspeare.*

WORKMANSHIP, *s.* Manufacture; something made by any one.—By how much Adam exceeded all men in perfection, by being the immediate *workmanship* of God, by so much did that chosen garden exceed all parts of the world. *Raleigh.*—The skill of a worker; the degree of skill discovered in any manufacture.

The Tritonian goddess having heard
Her blazed fame, which all the world had fill'd,
Came down to prove the truth, and due reward,
For her praiseworthy *workmanship* to yield. *Spenser.*

The art of working.—If there were no metals, 'tis a mystery to me how Tubalcain could ever have taught the *workmanship* and use of them. *Woodward.*

WORKMASTER, *s.* The performer of any work.

Desire, which tends to know
The works of God, thereby to glorify
The great *workmaster*, leads to no excess. *Milton.*

WORKSALL, **HIGH** and **LOW**, adjoining townships of England, North Riding of Yorkshire; about 4 miles south-west of Yarm.

WORKSHOP, *s.* The place where the workman carries on his work.—Supreme beauty is seldom found in cottages or *workshops*. *Johnson.*

WORKSOP, a market town of England, in the county of Nottingham, near the west side of the county, near which is the course of the Chesterfield canal to join the Trent, to the north-west of which, within the parish, are the Shire Oaks, so named from one spreading oak, whose branches were said to overshadow a small portion of three counties, Nottinghamshire, Derbyshire, and Yorkshire. It is near the head of the small river Ryton, and is noted for its malt and liquors. Leland says it was anciently called Radeford. It now consists principally of two streets. It had formerly a priory, of which the ancient church is still in existence, and is a fine old building, well deserving the traveller's notice. On the west is a circular entrenchment on a hill, the site of the ancient castle, which commanded a branch of the river. On the left is a road to Chesterfield, and a mile beyond is another to Sheffield. Its market is on Wednesday, and the fairs are March 20, May 20, June 21, and October 3; 26½ miles north of Nottingham, and 147 north-west of London. Population 3702.

WORKUM, a town of the Netherlands, in the province of Friesland; 20 miles south-south-west of Leeuwarden. Population 1400.

WORKUM, or **WOUDRICHEM**, a town of the Netherlands, in North Brabant. Population 600.

WORKWOMAN, *s.* A woman skilled in needle-work. The most fine-fingered *workwoman* on ground,
Arachne, by his means was vanquished. *Spenser.*

A woman that works for hire.

WORKYDAY, *s.* The day not the sabbath.—Tell her but a *workyday* fortune. *Shakspeare.*

WORLABY, or **WORLETBY**, a parish of England, in Lincolnshire; 5 miles north-by-east of Glanford Bridge.

WORLD, *s.* [popl^b, Saxon; *wereld*, Dutch.] *World* is the great collective idea of all bodies whatever. *Locke.*—System of beings.

Know how this *world*
Of heaven and earth conspicuous first began. *Milton.*

The earth; the terraqueous globe.

He the *world*
Built on circumfluous waters. *Milton.*

Present state of existence.

I'm in this earthly *world*, where to do harm
Is often laudable; to do good sometime
Accounted dangerous folly. *Shakspeare.*

A secular life.

Happy is she that from the *world* retires,
And carries with her what the *world* admires.
Thrice happy she, whose young thoughts fixt above,
While she is lovely, does heav'n make love;
I need not urge your promise, ere you find
An entrance here, to leave the *world* behind? *Waller.*

Public life; the public.

Why dost thou shew me thus to th' *world*?
Bear me to prison. *Shakspeare.*

Business of life; trouble of life.

Here I'll set up my everlasting rest,
And shake the yoke of man's suspicious stars
From this *world*-wearied flesh. *Shakspeare.*

Great multitude.

You a *world* of curses undergo,
Being the agents, or base second means. *Shakspeare.*

Nor doth this wood lack *worlds* of company;
For you in my respect are all the world. *Shakspeare.*

Mankind; an hyperbolic expression for many: *all the world* is a favourite phrase in French, for *many*.

'Tis the duke's pleasure,
Whose disposition, *all the world* well knows,
Will not be rubb'd nor stopp'd. *Shakspeare.*

Course of life.—Persons of conscience will be afraid to begin the *world* unjustly. *Richardson.*—Universal empire.—Rome was to sway the *world*. *Milton.*—The manners of men; the practice of life.—Children should not know any wickedness. Old folks have discretion, and know the *world*. *Shakspeare.*—Every thing that the world contains.—Had I now a thousand *worlds*, I would give them all for one year more, that I might present to God one year of such devotion and good works, as I never before so much as intended. *Law.*—A large tract of country; a wide compass of things.

'Tis I who love's Columbus am, 'tis I,
That must new *worlds* in it descry. *Cowley.*

A collection of wonders; a wonder. *Obsolete.*—The bassa having recommended Barbarussa, it was a *world* to see how the court was changed upon him. *Knolles.*—Time. A sense originally Saxon; now only used in *World without end*.

In the WORLD. In possibility.—All the precautions *in the world* were taken for the marriage of his younger brother. *Addison.*

For all the WORLD. Exactly. A ludicrous sense; now little used.—He had a pair of horns like a bull, his feet cloven, as many eyes upon his body as my grey mare hath dapples, and for *all the world* so placed. *Sidney.*

WORLDHAM, **EAST** and **WEST**, two adjoining parishes of England, in Southamptonshire, near Alton.

WORLDLINESS, *s.* Covetousness; addictedness to gain.

WORLDLING, *s.* A mortal set upon profit.

For

For his weeping in the needless stream ;
 Poor deer, quoth he, thou mak'st a testament
 As *worldlings* do, giving thy sum of more
 To that which had too much.

Shakspeare.

WORLDLY, *adj.* Secular ; relating to this life, in contradistinction to the life to come.

He is divinely bent to meditation ;
 And in no *worldly* suits would he be moved,
 To draw him from his holy exercise.

Shakspeare.

Bent upon this world ; not attentive to a future state.

They'll practise how to live secure,
Worldly or dissolute, on that their lords
 Shall leave them to enjoy.

Milton.

Human ; common ; belonging to the world.—Many years it hath continued, standing by no other *worldly* mean, but that one only hand which erected it. *Hooker.*

WORLDLY, *adv.* With relation to the present life.

Since your mind is *worldly* bent,
 Therefore of the two gifts in my dispose,
 Think ere you speak, I grant you leave to choose. *Dryden.*

WORLE, a parish of England, in Somersetshire ; $7\frac{1}{2}$ miles north-west of Axbridge.

WORLESTON, a township of England, in Cheshire ; $3\frac{1}{2}$ miles north of Nantwich.

WORLDINGHAM, GREAT and LITTLE, united parishes of England, in Suffolk ; 2 miles east-south-east of Beccles.

WORLDINGTON, a parish of England, in Suffolk ; 1 mile west-south-west of Mildenhall.

WORLDINGTON, EAST and WEST, adjoining parishes of England, in Devonshire.

WORLDINGWORTH, a parish of England, in Suffolk ; 5 miles north-west of Framlingham. Population 595.

WORLDITZ, a town of Germany, in the duchy of Anhalt-Dessau. Population 1900.

WORM, *s.* [wyrm, Saxon ; worm, Dutch ; vermis, Lat.] A small harmless serpent that lives in the earth.

Both the princes

Thy broken faith hath made a prey to worms. *Shakspeare.*

I from my marble monument shall rise

Again in fire, and see him with these eyes.

Sandys.

At once came forth whatever creeps the ground,
 Insect or worm.

Milton.

A poisonous serpent.—The mortal worm. *Shakspeare.*—Animal bred in the body.—Physicians observe these worms engendered within the body of man. *Harvey.*—The animal that spins silk. Silkworm.—Thou owest the worm no silk, the sheep no wool. *Shakspeare.*—Grubs that gnaw wood and furniture.

'Tis no awkward claim,

Pick'd from the worm-holes of long-vanish'd days,

Nor from the dust of old oblivion rak'd.

Shakspeare.

Something tormenting.—The worm of conscience still begnaw thy soul ! *Shakspeare.*—Any thing vermiculated, or turned round ; any thing spiral. A supposed membrane or ligament under the tongue of a dog. See the second meaning of *To WORM.*—When you see a mad dog step aside out of his walk only to bite somebody, and then return to it again, you had best ask him the reason why he did so ? Why, the reason is that he is mad, and his worm will not let him be quiet, without doing mischief, when he has opportunity. *South.*

To WORM, *v. n.* To work slowly, secretly, and gradually.

When debates and fretting jealousy,
 Did worm and work within you more and more,
 Your colour faded.

Herbert.

To WORM, *v. a.* To drive by slow and secret means, perhaps as by a screw.—They find themselves wormed out of all power, by a new spawn of independents, sprung from your own bowels. *Swift.*—To deprive a dog of something,

nobody knows what, under his tongue, which is said to prevent him, nobody knows why, from running mad.—Every one that keepeth a dog, should have him wormed. *Mortimer.*

WORMBRIDGE, a parish of England, in Herefordshire ; 9 miles south-west of Hereford.

WORMDIT, or ORMETA, a town of East Prussia, on the small river Drevenz, with 2300 inhabitants.

WORMEAT, or WO'RMEATEN, *adj.* Gnawed by worms.—For his verity in love, I do think him as concave as a covered goblet, or a wormeaten nut. *Shakspeare.*—Old ; worthless.

His chamber all was hanged about with rolls,

And old records from antient times deriv'd ;

Some made in books, some in long parchment scrolls,

That were all wormeaten, and full of canker holes. *Spenser.*

WORMEATENNESS, *s.* State of being wormeaten ; rottenness.—By the ceasing of the teeth, we must understand all those infirmities that are incident to them by reason of age, whether looseness, hollowness, rottenness, wormeatenness, &c. *Smith.*

WORMELOW, a hamlet of England, in Herefordshire ; $6\frac{1}{2}$ miles from Hereford.

WORMENHALL, a parish of England, in Buckinghamshire ; 12 miles west-south-west of Aylesbury.

WORMER, a village of the Netherlands ; 8 miles north of Amsterdam. It is noted for its extensive manufacture of white lead for painting. Population 1200.

WORMGAY, or WERMEGAY, a parish of England, in Norfolk ; 7 miles north-north-east of Market Downham.

WORMHILL, a township of England, in Derbyshire, near Tideswell.

WORMHOUT, a town of French Flanders ; 45 miles north-west of Douay. Population 3100.

WORMINGFORD, a parish of England, in Essex ; $6\frac{1}{2}$ miles north-west of Colchester. Population 385.

WORMINGTON, a parish of England, in Gloucestershire ; 5 miles north-by-east of Winchcombe.

WORMIUS (Olaus), a Danish physician, descended from a family which fled from Arnheim, in Guelderland, to Denmark, from the persecution of the duke of Alva, was born at Aarhus, in Jutland, in 1588, and finished his education at the university of Marburg ; afterwards availing himself of the lectures which he attended in the principal German academies, and in his tour through France, Italy, Switzerland, and Holland. He then returned to Denmark in 1610, and having in the following year taken the degree of doctor in medicine at Basle, he passed through the Netherlands to England, and in 1613 returned to his native country, where by successive preferments he became professor of medicine in 1624, in consequence of the resignation of Caspar Bartholin. Although he obtained, in 1636, a canonicate in the chapter of Lund, he continued his professional practice, and was often consulted by Christian IV. and Christian V. His knowledge of antiquities, medicine, and anatomy, was profound ; and in 1628 he discovered bones in the human skull, called after his name "sex ossicula Wormiana in sutura cranii lamdoidea." His collection of curiosities was, after his death, lodged in the royal museum. He was thrice married, and had 18 children. He died in 1654. His writings were very numerous ; and the principal of them are enumerated in the General Biography, to which we refer.

WORMLEIGHTON, a parish of England, in Warwickshire ; 6 miles from Southam.

WORMLEY, a parish of England, in Hertfordshire, near Cheshunt.

WORMS, a city in the west of Germany, which, if not large, is ancient, and well known in history. It stands on the left bank of the Rhine, a few hundred yards from the river, and is, like most old towns in Germany, surrounded with a decaying wall. The streets are dark and narrow ; the cathedral, a ponderous Gothic building, with dismantled walls. The population is said to have been formerly considerable ; but the city having been laid waste by the French

in the general devastation of the palatinate in 1689, part of the inhabitants retired to Frankfort on the Maine, or to Holland; and many of the houses were never rebuilt, the ground belonging to them being laid out in gardens. Of late, however, the place is rather on the increase; the inhabitants, amounting in 1801, to only 4800, having been found, by a late return, to be 5700. The greater part are Lutherans, the Catholics being few, the Calvinists still fewer. The public buildings are the mint, the town-house, in which Luther appeared before the diet in 1521, and the new church. The environs of Worms are fertile, and remarked for the quality of their wine; but the title of the town to historic notice, arises from its having been frequently the seat of the diet of the empire. Few places have suffered more from war and other calamities. So early as 407 it was ravaged by the Vandals; in 451, and 538, by the Huns. It has suffered also by fires; and on one or two occasions, by earthquakes. It is now subject to Hesse-Darmstadt, and is 25 miles south of Mentz.

WORMS.—The former bishopric of this name comprised a territory in the west of Germany, of the extent of 170 square miles, with 18,000 inhabitants. It was divided into two parts by the Rhine; and, at the peace of Luneville in 1801, the portion to the west of that river was ceded to France, while that to the east was given to Hesse-Darmstadt. At present, the whole belongs to the latter power.

WORMSHILL, or **WORMSELL**, a parish of England, in Kent; 6 miles from Charing.

WORMSLEY, a parish of England, in Herefordshire, near Weobly.—2. A parish in Oxfordshire; 6½ miles south-east of Tetsworth.

WORMSOE, a small island of European Russia, in the Baltic, on the coast of Esthonia, in lat. 49. N. long. 22. E. It contains a village, inhabited by Swedes.

WORMSTALL, a hamlet of England, in the parish of Kintbury, Berkshire.

WORMWOOD, *s.* A plant.—*Wormwood* hath an indeterminate stalk, branching out into many small shoots, with spikes of naked flowers hanging downward; the leaves are hoary and bitter. Of this plant there are thirty-two species, one of which, the common *wormwood*, grows in the roads; but it is also planted in gardens for common use. Great variety of sea *wormwoods* are found in the salt marshes of England, and sold in the markets for the true Roman *wormwood*, though they differ greatly. *Miller.*

She was wean'd; I had then laid

Wormwood to my dug.

Shakspeare.

WORMY, *adj.* Full of worms.

Spirits that in crossways and floods have burial,
Already to their *wormy* beds are gone. *Shakspeare.*

Earthy; grovelling.—By greatness of mind we are brought to a just contempt of sordid and *wormy* affections. *Bp. Reynolds.*

WORN. Part. pass. of *wear*. *Worn out* is quite consumed.

His is a maiden shield,
Guiltless in fight: mine batter'd, hew'd, and bor'd,
Worn out of service, must forsake his lord. *Dryden.*

WORNIL, *s.* In the backs of cows in the summer, are maggots generated, which in Essex we call *wornils*, being first only a small knot in the skin. *Derham.*

WORONZOW, POINT, a cape in Cook's inlet, on the west coast of North America. Lat. 60. 8. N. long. 210. 36. E.

WORPLESDON, a parish of England, in Surrey, near Guildford. Population 993.

WORRIER, *s.* One who worries or torments.—More material and coarser sort of dæmons, conceived the *worriers* of souls. *Spenser.*

To **WORRY**, *v. a.* [popigan, Saxon, depopulari; cognatum; sine dubio, Su. Goth., *warg*, *wargr*, lupus, latro: à Germ. *wurgen*, trucidare, premere, strangulare. *Serenius.* The old word seems to be in the following passage: "To

werre each other, and to slay."—To tear, or mangle, as a beast tears its prey.

If we with thrice such powers left at home,
Cannot defend our own doors from the dog;
Let us be *worried*.

Shakspeare.

This revives and imitates that inhuman barbarity of the old heathen persecutors, wrapping up christians in the skins of wild beasts, that so they might be *worried* and torn in pieces by dogs. *South.*—To harass, or persecute brutally.—Then embraces his son-in-law; then again *worries* he his daughter with clipping her. *Shakspeare.*

WORSBOROUGH, a township of England, in the West Riding of Yorkshire. Population 1073.

WORSE, *adj.* The comparative of *bad*: *bad*, *worse*, *worst*. [wɜːs, Saxon; *wairs*, M. Goth.] More bad; more ill.—In happiness and misery, the question still remains, how men come often to prefer the *worse* to the better, and to chuse that, which, by their own confession, has made them miserable. *Locke.*

WORSE, *adv.* In a manner more bad.—The more one sickens, the *worse* at ease he is. *Shakspeare.*

The **WORSE**, *s.* The loss; not the advantage; not the better.

Was never man, who most conquests atchiev'd,
But sometimes had the *worse*, and lost by war. *Spenser.*

Something less good.—A man, whatever are his professions, always thinks the *worse* of a woman, who forgives him for making an attempt on her virtue. *Richardson.*

To **WORSE**, *v. a.* To put to disadvantage. This word, though analogical enough, is not now used.

Perhaps more valid arms,
Weapons more violent, when next we meet,
May serve to better us, and *worse* our foes. *Milton.*

To **WO'RSEN**, *v. a.* To *worsen*.—It *worsens* and slugs the most learned. *Milton.*

WO'RSER, *adj.* A barbarous word, formed by corrupting *worse* with the usual comparative termination.

Gods! take my breath from me:

Let not my *worser* spirit tempt me again

To die before you please.

Shakspeare.

WO'RSHIP, *s.* [wɔːrʃɪp, Saxon.] Dignity; eminence; excellence.

My train are men of choice, and rarest parts,

That all particulars of duty know;

And in the most exact regard support

The *worship* of their names.

Shakspeare.

. A character of honour.

I belong to *worship*, and effect

In honour, honesty.

Shakspeare.

A title of honour.—Dinner is on table; my father desires your *worship's* company. *Shakspeare.*—A term of ironical respect.

Against your *worship*, when had S—k writ?

Or P—ge pour'd forth the torrent of his wit?

Pope.

Adoration; religious act of reverence.

They join their vocal *worship* to the quire

Of creatures wanting voice.

Milton.

Honour; respect; civil deference.—The humble guest shall have *worship* in the presence of those who sit at meat with him. *St. Luke.*

'Tis not your inky brows, your black silk hair,

Your bugle eyeballs, nor your cheek of cream

That can entame my spirits to your *worship*. *Shakspeare.*

To **WO'RSHIP**, *v. a.* To adore; to honour or venerate with religious rites.

On the smooth rind the passenger shall see

Thy name engrav'd, and *worship* Helen's tree.

Dryden.

To respect; to honour; to treat with civil reverence.

Our grave,
Like Turkish mute, shall have a tongueless mouth,
Not *worshipp'd* with a waxen epitaph. *Shakspeare.*

To honour with amorous respect.

With bended knees I daily *worship* her,
Yet she consumes her own idolater. *Carew.*

To WORSHIP, *v. n.* To perform acts of adoration.—
The people went to *worship* before the golden calf.

WORSHIPFUL, *adj.* Claiming respect by any character
or dignity.

This is *worshipful* society,
And fits the mounting spirit like myself. *Shakspeare.*

A term of ironical respect.—Every man would think me
an hypocrite; and what excites your most *worshipful*
thought to think so? *Shakspeare.*—Suppose this *worshipful*
idol be made, yet still it wants sense and motion. *Stillingfleet.*

WORSHIPFULLY, *adv.* Respectfully.
Hastings will lose his head, ere give consent,
His master's son, as *worshipfully* he terms it,
Shall lose the royalty of England's throne. *Shakspeare.*

WORSHIPPER, *s.* Adorer; one that worships.
What art thou, thou idol ceremony?
What kind of God art thou that suffer'st more
Of mortal griefs, than do thy *worshippers*. *Shakspeare.*

WORSLEY, a township of England, in Lancashire; 5½
miles south-south-east of Great Bolton. Population 6151.

WORSLEY GREEN, a hamlet of England, in the parish
of Great Hallingbury, Essex.

WORST, *adj.* [The superlative of *bad*, formed from
worse: *bad, worse, worst.*] Most bad; most ill.
If thou hadst not been born the *worst* of men,
Thou hadst been knave and flatterer. *Shakspeare.*

WORST, *s.* The most calamitous or wicked state; the
utmost height or degree of any thing ill.

Who is't can say, I'm at the *worst*?
I'm worse than e'er I was,
And worse I may be yet: the *worst* is not,
So long as we can say, this is the *worst*. *Shakspeare.*

To WORST, *v. a.* To defeat; to overthrow.—She could
have brought the chariot again, when she saw her brother
worsted in the duel. *Dryden.*

WORSTEAD a town of England, in the county of Norfolk. It is remarkable for the first introduction of the manufacture of printed woollen yarn or *worsted*. It was formerly a town of considerable trade, but is now reduced to a village; and the manufactures, which obtained a name from the place, are now removed to Norwich and its vicinity. *Worsted-hall*, the seat of Sir George Braggrave, Bart., is contiguous to the village; 4 miles south-south-east of North Walsham, and 120 north-east-by-north of London. Population 619.

WORSTED, *s.* [from *Worstead*, a town in Norfolk famous for the woollen manufacture. "A nre seigneur le roi monstrant les poueres listours et overours des draps de *Wurthstede* en le comte de Norff". Rot. Parl. 2. Ed. III.] Woollen yarn; wool spun.—A base, proud, shallow, beggarly three suited, hundred pound, filthy *worsted*-stocking knave. *Shakspeare.*

WORSTHORNE, a township of England, in Lancashire. Population 309.

WORSTON, a township of England, in Lancashire; 1½
mile east-north-east of Clitheroe.

WORT, *s.* [wýrt, peort, Sax.; *worte* Dutch.] Originally a general name for an herb; whence it still continues in many, as *liverwort*, *spleenwort*.—A plant of the cabbage kind.

Mending of broken ways, carrying of water,
Planting of *worts* and onions. *Beaum. and Fl.*

[wýrt, Sax.] New beer either unfermented, or in the act
of fermentation.—If in the *wort* of beer, while it worketh,

before it be tunned, the burrage be often changed with fresh,
it will make a sovereign drink for melancholy. *Bacon.*

To WORTH, or *Wurth*, *v. a.* To betide; to happen to.
This word was formerly common in conjunction with *woe*;
as, *woe worth thee*, i. e. *woe be to thee*, or *woe betide thee*;
an expression still used in several parts of the north of England: *pa peorðe*, or *pujðe*, Saxon, from *peorðan*, *evenire fieri*.

They shall—

Despise my cruelty, and cry *woe worth* me! *Beaum. and Fl.*

WORTH, in the termination of the names of places, comes
from *porð*, a court or farm, or *porðiz*, a street or road. *Gibson.*

WORTH, *s.* [peorð, Saxon; *wairths*, M. Goth., from
wairthan; Saxon, *peorðan*; to be.] Price; value.—Your
clemency will take in good *worth* the offer of these my simple
and mean labours. *Hooker.*—Excellence; virtue.

Her virtue, and the conscience of her *worth*
That would be wood. *Milton.*

Importance; valuable quality.—Peradventure those things
whereupon time was then well spent, have sithence lost their
dignity and *worth*. *Hooker.*

WORTH, *adj.* Equal in price to; equal in value to.
Women will love her that she is a woman,
More *worth* than any man: men that she is
The rarest of all women. *Shakspeare.*

Deserving of, either in a good or bad sense.
Your son and daughter found this trespass *worth*
The shame which here it suffers. *Shakspeare.*

Equal in possessions to.

Dang'rous rocks,
Which touching but my gentle vessel's side,
Would scatter all the spices on the stream,
Enrobe the roaring waters with my silks;
And in a word but even now *worth* this,
And now *worth* nothing. *Shakspeare.*

WORTH, a township of England, in Cheshire; 5 miles
south-east of Stockport.—2. A hamlet in Devonshire.

WORTH, or WORDE, a parish of England, in Kent, near
Sandwich.—2. A parish in Sussex; 8 miles north of Cuckfield.

WORTH, FRANCIS, a hamlet of England, in the parish
of Netherby, Dorsetshire.

WORTH, MATRAVERS, a parish of England, in Dorsetshire,
near Corfe Castle.

WORTHAM, a parish of England, in Suffolk; 5 miles
north-west of Eye.

WORTHEN, a parish of England, in Salop; 12 miles
west-south-west of Shrewsbury. Population 1989.

WORTHILY, *adv.* Suitably; not below the rate of.—
The divine original of our souls hath little influence upon us
to engage us to walk *worthily* of our extraction, and to do
nothing that is base. *Ray.*—Deservedly; according to merit.

They are betray'd

While they pervert pure nature's healthful rules
To loathsome sickness *worthily*, since they
God's image did not reverence in themselves. *Milton.*

Justly; not without cause.

The king is present; if 't be known to him
That I gainsay my deed, how may he wound,
And *worthily*, my falsehood. *Shakspeare.*

WORTHINESS, *s.* Desert; merit.—The prayers which
our Saviour made were for his own *worthiness* accepted, ours
God accepteth not, but with this condition, if they be joined
with a belief in Christ. *Hooker.*—Excellence; dignity; virtue.—He that is at all times good, must hold his virtue to you,
whose *worthiness* would stir it up where it wanted, rather than
slack it where there is such abundance. *Shakspeare.*—State
of being worthy; quality of deserving.—She is not worthy to
be loved, that hath not some feeling of her own *worthiness*.

WORTHING,

WORTHING, a hamlet of England, in Sussex. It was originally a poor fishing village, but has now become a fashionable watering place. The modern buildings are on the coast, but the village extends towards the Downs in a straight line, for about half-a-mile. Here are two respectable libraries, and commodious warm baths. A fishery is carried on here in spring for mackarel, and in autumn for herrings. Fair 20th, 21st, and 22d July; 11 miles from Brighton. Population, including Broadwater, 3725.—2. A hamlet of England, in Norfolk, near East Dereham.

WORTHINGBURY, a parish of Wales, in Flintshire; 10 miles from Chester. Population 511.

WORTHINGTON, a township of England, in Lancashire, near Wigan.—2. A parish in Leicestershire; 4 miles north-east of Ashby-de-la-Zouch. Population 1113.

WORTHINGTON, a post township of the United States, in Hampshire county, Massachusetts; 100 miles west of Boston. Population 1391.—2. A post township of Franklin county, Ohio, on the Whetstone. It is very pleasantly situated, and contains an academy and a large woollen manufactory.

WORTHLESS, *adj.* Having no virtues, dignity, or excellence.

You, his false hopes, the trust of England's honour,
Keep off aloof, with *worthless* emulation. *Shakspeare.*

Having no value.

Am I then doom'd to fall

By a boy's hand? and for a *worthless* woman? *Addison.*

WORTHLESSNESS, *s.* Want of excellence; want of dignity; want of value.—But that mine own *worthlessness* spoils the conceit, I could think our company parallel to the seven wise men of Greece. *More.*—A notable account is given us by the apostle of this windy insignificant charity of the will, and of the *worthlessness* of it, not enlivened by deeds. *South.*

WORTHY, *adj.* Deserving; such as merits; with of before the thing deserved.

Further, I will not flatter you,

That all I see in you is *worthy* love,

Than this: that nothing do I see in you

That should merit hate. *Shakspeare.*

Valuable; noble; illustrious; having excellence or dignity.—Happier thou may'st be, *worthier* canst not be. *Milton.*—Having worth; having virtue.

The doctor is well money'd, and his friends

Potent at court; he, none but he, shall have her;

Though twenty thousand *worthier* come to crave her. *Shakspeare.*

Not good. *A term of ironical commendation.*

My *worthy* wife our arms mislaid,

And from beneath my head my sword convey'd;

The door unlatch'd; and with repeated calls

Invites her former lord within my walls. *Dryden.*

Suitable for any quality good or bad; equal in value; equal in dignity.

My suff'rings for you make your heart my due;

Be *worthy* me, as I am *worthy* you. *Dryden.*

Suitable to any thing bad.

The merciless Macdonald,

Worthy to be a rebel; for to that

The multiplying villainies of nature

Do swarm upon him. *Shakspeare.*

Deserving of ill.—What has he done to Rome that's *worthy* death. *Shakspeare.*

WORTHY, *s.* A man laudable for any eminent quality, particularly for valour.

What do these *worthies*

But rob and spoil, burn, slaughter, and enslave

Peaceable nations. *Milton.*

To **WORTHY**, *v. a.* To render worthy; to aggrandise; to exalt. *Not used.*

He conjunct, trip'd me behind;

And put upon him such a deal of man,

That *worthied* him; got praises of the king,

For him attempting, who was self-subdu'd. *Shakspeare.*

WORTHY, ABBOTS, a hamlet of England, in Southamptonshire.

WORTHY, HEADBOURNE, a parish of England, in the above county; 2 miles north-by-east of Winchester.

WORTHY, KING'S, another parish in the same county, near Winchester.

WORTHY, MARTYR, also a parish in Southamptonshire, near Winchester.

WORTING, a parish of England, in Southamptonshire; near Basingstoke.

WORTLEY, a hamlet of England, in Gloucestershire; near Wootton-under-Edge.—2. A township in the West Riding of Yorkshire; 3 miles south-west of Leeds. Population 2336.—3. A township in the same Riding; 5½ miles south-west of Barnesley.

WORTON, a hamlet of England, in the parish of Isleworth, Middlesex.

WORTON, NETHER and OVER, two small parishes of England, in Oxfordshire, about 3 miles south-west of Deddington.

WORTWELL, a hamlet of England, in Norfolk; 2½ miles north-east of Harleston. Population 437.

WORUMBANG, a village of Western Africa, on the frontier of Manding, towards Jallonkadoo.

WOSCHITZ, NEW and OLD, two small towns of Bohemia, with considerable silver mines. New Woschitz has 1200 inhabitants, and is 43 miles south-south-east of Prague.

WOSSINGEN, a small town of the west of Germany, in Baden, with 1300 inhabitants; 10 miles east of Carlsruhe.

WOSTENHOLM, CAPE, a cape in Hudson's bay. Lat. 62. 40. N. long. 77. 40. W.

WOSTITZ, or WLASATICE, a town of Moravia, with 1100 inhabitants; 17 miles south-by-east of Brunn.

To **WOT**, or *To WOTE*, *v. n.* [pat, from pican, Sax., whence *wet*, to know; of which the preterite was *wot*, knew.] To know; to be aware. *Obsolete.*

Wot you, what I found?

Forsooth, an inventory, thus importing. *Shakspeare.*

WOTHERSOME, a township of England, in Yorkshire; 5 miles south of Wetherby.

WOTHORPE, or WRIDTHORPE, a hamlet of England, in Northamptonshire; 5½ miles north-west of Wandsford.

WOTITZ, or WOTICZE, a small town in the interior of Bohemia, in the circle of Beraun, with 1300 inhabitants.

WOTTON (Sir Henry), was born at Boughton-hall, in Kent, in 1568, and in 1584 entered of New college, Oxford, from which he removed to Queen's college. During his residence in the university, he applied with diligence to the study of logic and philosophy, of polite literature and civil law, and at this time composed a tragedy, which gained the applause of his fellow-collegians. Upon the death of his father in 1589, he availed himself of the small patrimony that was left to him in travelling through France, Italy, Germany, and the Low Countries, in order to improve his acquaintance with men and manners in these several countries. On his return in 1596, he was appointed secretary to the earl of Essex; and when this nobleman was apprehended on a charge of high treason, he consulted his own safety by quitting the kingdom. As he fixed his residence chiefly at Florence, he employed himself in composing a treatise, which was published after his death in 1657, under the title of "The State of Christendom; or, a most exact and curious Discovery of many secret Passages and hidden Mysteries of the Times." When a plot was detected by the grand-duke of Tuscany for taking away the life of James, king of Scotland, Wotton was engaged to communicate intelligence of it to the king. Having fulfilled this mission, he returned to Florence; and when James came to the crown, he recompensed his service by conferring upon him the honour of knighthood. In 1604 he was appointed ambassador in ordi-

nary to Venice, where he acquired such reputation that several young gentlemen of rank attended him for improvement. In his way through Augsburg, he drew up the following humorous definition of an ambassador:—"Legatus est vir bonus peregre missus ad mentiendum reipublicæ causa;" *i. e.* an ambassador is a good man, sent abroad to lie for the service of his country. This sentence was afterwards alleged as a maxim avowed by the religion professed by the king of England; and it so far excited the displeasure of James, that Wotton, after his return, remained for five years unemployed. An apology, however, regained the royal favour, and he was sent on an embassy first to the United Provinces, and afterwards in 1615 to Venice. After three years' residence he returned with the hope of succeeding to the office of secretary Winwood, but he was otherwise employed in various foreign embassies, from the last of which to Venice he did not return till after the death of James, when he was appointed, as a recompense for his services, to the provostship of Eton college in 1624. Soon after his settlement in this situation, he published his "Elements of Architecture." But as the statutes of the college required his assuming the clerical character, he took deacon's orders, without undertaking what he considered as too serious a charge, the cure of souls. In his domestic entertainments he maintained the reputation of hospitality, and in his connection with the seminary over which he presided, he was a liberal encourager of genius and application. For the amusement of advanced life he had contemplated a life of Luther, with a history of the Reformation; but Charles I. persuaded him to undertake a history of England, in which, however, he made little progress. Having large demands on government for money advanced in foreign services, his circumstances were embarrassed, and he frequently solicited his majesty to grant him new preferment. But death was the only termination of his wants and wishes; and this happened in December, 1639, in the 72d year of his age. His remains were interred in the chapel of Eton college, and the following epitaph was inscribed on the stone that covered them by his own order: "Hic jacet hujus sententiæ primus auctor, *Disputandi Pruritus Ecclesiarum Scabies*. Nomen alias quære." His accomplishments and literary acquisitions were very distinguished; and they are hyperbolically stated in Cowley's elegy, when he speaks of him as one

"Who had so many languages in store,
That only fame shall speak of him in more."

Business occupied so much of his time, that he had little leisure for writing. After his death were published his "Reliquiæ Wottonianæ;" and they have often been reprinted. Of his poems, there is one entitled "A Hymn to my God in a Night of my late Sickness," which has been highly extolled.—*Biog. Brit.*

WOTTON (William), a learned clergyman, was born in 1666, and under the tuition of his father, who was also a clergyman, he became a perfect phenomenon as to the knowledge of languages; for at the age of five years he could read the Latin, Greek, and Hebrew languages almost as well as English. Accordingly he was entered of Catharine-hall, Cambridge, some months before he was ten years of age: at twelve years and five months he took the degree of B. A., some time before which he had been celebrated in a copy of verses by Dr. Dupont, not only for his acquaintance with the learned languages, including Arabic, Syriac, and Chaldee, but his knowledge of geography, logic, philosophy, mathematics, and chronology. He commenced B. D. in 1691, and being chaplain to the earl of Nottingham, this nobleman presented him in 1693 to the rectory of Middleton-Keynes, in Buckinghamshire. His first work appeared in 1694, and was entitled "Reflections upon Ancient and Modern Learning." A second edition was published in 1697, and to this was annexed Dr. Bentley's Dissertation upon Phalaris, which involved Wotton in controversy, and subjected him to the sarcasm of Swift's Battle of Books. Wotton defended his own book against the objections of sir W. Temple and others, and some observations in the Tale of a Tub, in the third edition in 1705. In 1701 he published "The History of

Rome, from the Death of Antoninus Pius to the Death of Severus Alexander," 8vo. undertaken at the request of bishop Burnet, for the use of his pupil the duke of Gloucester; and recommended by Leibnitz to George II. when electoral prince. In 1706 he attacked "Tindal's Rights of the Christian Church," and in 1707 archbishop Tenison conferred upon him the degree of D. D. Notwithstanding his talents and learning, his life was irregular, and of course his circumstances embarrassed, so that in 1714 he was obliged to retire into South Wales, where he employed himself in writing. He also acquired the Welsh language, and was able to preach in it. Dr. Wotton, says one of his biographers, was one of those scholars, whose early proficiency, being chiefly the result of an extraordinary memory, was not followed by mature products corresponding to the expectations they excited. He died at the age of 60, in the year 1726. *Nichols's Lit. Anecd. Gen. Biog.*

WOTTEN'S-END, a hamlet of England, in Gloucestershire.

WOUDENBURG, a village of the Netherlands, in the province of Utrecht; 6 miles south of Amersfort. Population 1200.

WOUDSEND, a village of the Netherlands, in Friesland, with 900 inhabitants.

WOVE. The preterite and participle passive of *weave*.

Adam, waiting her return, had *wove*
Of choicest flowers, a garland.

Milton.

WO'VEN. The participle passive of *weave*.

No man living
Could say, that is my wife there: all were *woven*
So strangely in one piece.

Shakspeare.

WOUGHTON-ON-THE-GREEN, a parish of England, in Buckinghamshire.

WOULD. The preterite of *will*. It is generally used as an auxiliary verb with an infinitive, to which it gives the force of the subjunctive mood.—If God's providence did not so order it, cheats *would* daily be committed, which would justle private men out of their rights, and unhinge states. *Ray.*

I WOULD do it. My resolution is that it should be done by me.

Thou WOULDST do it. Such must be the consequence to thee; that such should be thy act.

He WOULD or it would. This must be the consequence to *him or it*; that such should be *his act, or its effect.*—The plural as the singular.

To themselves they live,
And to their island, that enough *would* give
A good inhabitant.

Chapman.

Was or am resolved; I wish or wished to; I am or was willing.

You *would* be satisfied?—
Would? nay, and will.

Shakspeare.

It is a familiar term for *wish to do, or to have.*—What *wouldst* thou with us? *Shakspeare.*—Should wish.

Celia! if you apprehend
The muse of your incensed friend;
Nor *would* that he record your blame,
And make it live; repeat the same;
Again deceive him, and again,
And then he swears he'll not complain.

Waller.

It is used in old authors for *should.*—The excess of diet *would* be avoided. *Bacon.*—It has the signification of *I wish, or I pray*; this is formed by a gradual corruption of the phrase, *would God*; which originally imported, *that God would, might God will, might God decree*; from this phrase ill understood came *would to God*; thence, *I would to God*: and thence, *I would*, or elliptically, *would*, came to signify, *I wish* and so it is used even in good authors. —*I would* my father look'd but with my eyes. *Shakspeare.*

Would thou hadst hearken'd to my words, and stay'd
With me, as I besought thee, when that strange

Desire

Desire of wand'ring, this unhappy morn,
Possess'd thee.

Milton.

WOULDHAM, a parish of England, in Kent; 2 miles from Chatham.

WOULDING, *s.* Motion of desire; disposition to any thing; propensity; inclination; incipient purpose.—It will be every man's interest to join good performances to spiritual purposes, to subdue the exorbitancies of the flesh, as well as to continue the *wouldings* of the spirit. *Hammond.*

WOUND, *s.* [punð, Sax.; *wonde*, Dutch; *wunda*, M. Goth.] A hurt given by violence.

I am faint; my gashes cry for help.—

—So well thy words become thee as thy *wounds*,
They smack of honour both.

Shakspeare.

To WOUND, *v. a.* To hurt by violence.

Adonis from his native rock
Ran purple to the sea, suppos'd with blood
Of Thammuz, yearly wounded.

Milton.

WOUND. The preterite and participle passive of *wind*.

He had rais'd to every ayry blow
A front of great height; and in such a place
That round ye might behold, of circular grace
A walk so *wound* about it.

Chapman.

WOUNDER, *s.* One that wounds.

WOUNDLESS, *adj.* Exempt from wounds.

Haply slander

———— may miss our aim,
And hit the *woundless* air.

Shakspeare.

WOUNDON, a hamlet of England, in the parish of Wolverhampton, Staffordshire.

WOUNDWORT, *s.* [*vulneraria*, Lat.] A plant. *Miller.*

WOUNDY, *adj.* Excessive. *A low bad word.*—These stockings of Susan's cost a *woundy* deal of pains the pulling on. *Gay.*

WOUTERS (Francis), was born at Liere, in Brabant, in 1614. He was a student in the school of Rubens, but applied himself principally to landscape, and became one of the most eminent of his time. He chose for his models the scenes of his native country, and particularly the forest of Soignes, near Brussels; embellishing the views he chose with groups of figures representing historical or allegorical subjects. Sometimes he attempted history, but not successfully. He was in favour with the emperor Ferdinand II.; but coming to England with his ambassador in 1637, he was appointed chief painter to the prince of Wales, afterwards Charles II. On the breaking out of the rebellion, he returned to Antwerp, and became director of the academy there, where, in 1659, he was killed by the accidental discharge of a gun.

WOVERMANS (Philip), was a remarkable and melancholy instance of those mis-shapen and unhappy combinations of talent, industry, and ill-fortune, which have occasionally disgraced the world of connoisseurship. He was the son of an indifferent historical painter, and was born at Haerlem in 1620. Having obtained possession of his father's store of pictorial knowledge, he was placed with John Wynants, the landscape-painter, under whose instruction he soon acquired a considerable degree of power in embodying the creations of his own fancy, and to this acquisition he added much by an attentive study of nature.

There is but little known of his private life. His pictures, beautiful as they are, agreeable in their composition and colour, and exquisite in their finish, exhausted his time without raising him above indigence and obscurity. The more free, slight, and loose works of Peter de Laer, called Bamboccio, absorbed the admiration of the Dutch collectors, while the elegant and delightful productions of Wouvermans remained unnoticed and unknown. Time has adjusted the balance, and the united voice of the tasteful now sheds a lustre over the name of the latter; too late, alas! for his gratification or benefit.

The neglect which he endured, and the severity of labour

Vol. XXIV. No. 1669.

required to complete so many pictures as he has left, in so high and perfect a degree of finishing, exhausted his health, and he died at the early age of 48; having burnt a short time before his death all his studies and drawings, to prevent, as he declared, his children from being induced to follow a profession which had been but a source of poverty and misery to himself.

The subjects of his pictures are drawn from the common scenes of nature, but are sometimes of a more elevated cast than those chosen by the generality of his compatriots, particularly his hawkings and huntings, where cavaliers and high dames, with appropriate scenery, rich trappings to their horses, and numerous retinues, are introduced with great taste and propriety. His encampments and battles are composed with the same skill and suavity; indeed the latter is a principal characteristic of all his works, whatever be their subjects, from the humble hay-cart to the richest combination of materials which the gay palace, its garden, and splendid adornments, afforded him. Farriers' shops, fairs of horses, travellers on their road, or at inn-doors, &c. &c. were equally rendered agreeable by his delightful arrangements of chiaro-oscuro and of colours, and by the exquisitely firm full touch with which they are executed. His works are numerous, and when in good preservation sell at very considerable prices.

WOVERMANS (Peter), the younger brother of Philip, was also an artist of considerable talent, though by no means equal to him. He was also born at Haerlem, about the year 1625. He was trained under R. Rogman, but principally followed his brother's style, and adopted his class of subjects. But though his pictures are frequently sold for Philip's, yet they are not so delicate or spirited, and may be easily distinguished from his by a cultivated eye. There was also another brother, John, a few years younger than Peter, who followed the same line of art with rather more talent; so that we cannot be surprised at the number of pictures which bear the name of Wouvermans. John died in 1666, at the age of 38.

WOUW, a village of the Netherlands, in North Brabant. Population 1600.

WOW, a fortified town of Hindostan, province of Gujerat, and district of Neyer, of which it may be considered as the capital. It was formerly governed by a female called the Ranny, whose territories were very considerable. It is still a place of consequence, and the residence of 1000 Rajpoot families. It is subject to the chief of Theraud. Lat. 24. 11. N. long. 71. 23. E.

WOWAMIA, a town of Hindostan, province of Gujerat. It stands on the eastern shore of the Runn, and possesses a ferry for conveying travellers to the district of Cutch. It forms a small independency belonging to a Hindoo chief. Lat. 22. 50. N. long. 70. 47. E.

WOX, or WOXE. The preterite of *wax*. Became. *Obsolete.*

The ape in wond'rous stomach *wox*,
Strongly encourag'd by the crafty fox.

Spenser.

WO'XEN. The participle of *To wax*. *Obsolete.*—And all his sinews *woxen* weak and raw. *Spenser.*

WOYNICZ, or WOYNICZE, a small town of Austrian Poland, on the Dunajec.

WOYRILOW, a small town of Austrian Poland, at the confluence of the Siwka and the Lonmica, in the circle of Stry.

WOYSLAWIEC, a town of Poland, 44 miles east-south-east of Lublin. Population 1200.

WOZICZ, JUNG, a town of Bohemia; 43 miles south-south-east of Prague. Population 1000.

WRABNESS, a parish of England, in Essex; 4½ miles east of Manningtree.

WRACK, *s.* [*wrack*, Dutch, a ship broken; *πρᾶκτε*, Sax., a wretch. See WRECK. The old poets use *wrack* or *wreck* indifferently, not only as rhyme requires, but in any part of the verse; later writers, both of poetry and prose, *wreck*.] Destruction of a ship by winds or rocks.

Now, with full sails into the port I move,
And safely can unlade my breast of love;
Quiet and calm: why should I then go back,
To tempt the second hazard of a *wrack*?

Dryden.

Ruin; destruction. This is the true Saxon meaning.—A world devote to universal *wrack*. *Milton.*

To WRACK, *v. a.* To destroy in the water; to wreck. See WRECK. It seems in Milton to mean *to rock*, to shake. Each on his rock transfix'd, the spot and præy
Of *wracking* whirlwinds. *Milton.*

To torture; to torment. This is commonly written *rack*; and the instrument of torture, always *rack*. Merab rejoic'd in her *wrack'd* lover's pain,
And fortify'd her virtue with disdain. *Cowley.*

WRA'CKFUL, *adj.* Ruinous; destructive.—Ships—*wrackfull* tempests rent. *Drayton.*

WRACLAWEK, a town of Poland, on the Vistula; 33 miles west-north-west of Plock. Population 2300.

WRAGBY, a market-town of England, in Lincolnshire, nearly in the centre of the county, and pleasantly seated on a small stream which falls into the Witham. Here is a free-school, founded in 1633, with a chapel, and an alms-house for six clergymen's widows, and six other destitute persons. Market on Thursday, and two considerable fairs, on Holy Thursday and Michaelmas day; 11 miles east of Lincoln. Population 509.

WRAGBY, a parish of England, West Riding of Yorkshire; 5 miles from Wakefield.

WRAGHOLME, a hamlet of England, in the parish of Grainthorpe, Lincolnshire.

WRAITH, *s.* [etymology unknown.] The apparition of a person about to die, as pretended in parts of the north. *Grose.*—The *wraith* or spectral appearance of a person shortly to die, is a firm article in the creed of Scottish superstition. Nor is it unknown to our sister kingdom. See the story of the beautiful Lady Diana Rich, in Aubrey's *Miscell.* p. 89. *Scott.*

WRAMPLINGHAM, a parish of England, in Norfolk, near Wymondham.

WRANGELSOE, a small island of European Russia, in the Baltic.

To WRA'NGLE, *v. n.* [etymology unknown.] To dispute peevishly; to quarrel perversely; to altercation; to squabble.

Yes, for a score of kingdoms you should *wrangle*,
And I would call it fair play. *Shakspeare.*

Some unhatch'd practice
Hath puddled his clear spirit; and in such cases,
Men's natures *wrangle* with inferiour things,
Though great ones are their object. *Shakspeare.*

Fill'd with the sense of age, the fire of youth,
A scorn of *wrangling*, yet a zeal for truth. *Pope.*

WRA'NGLE, *s.* A quarrel; a perverse dispute.—The giving the priest a right to the tithe would produce lawsuits and *wrangles*. *Swift.*

WRANGLE, a parish of England, in Lincolnshire; 9 miles north-east of Boston. Population 843.

WRA'GLER, *s.* A perverse, peevish, disputative man. Tell him h'ath made a match with such a *wrangler*,
That all the courts of France will be disturb'd
With chases. *Shakspeare.*

To WRAP, *v. a.* Pret. and part. pass. *wrapped* or *wrapt*. [*wrafla*, Danish; *wrafla* sammen, *implicare*; *reifar*, Icel. fasciis involvere; *reifar*, fasciæ. *Serenius.*] To roll together; to complicate.

This said, he took his mantle's foremost part,
He 'gan the same together fold and *wrap*. *Fairfax.*

To involve; to cover with something rolled or thrown round. It has often the particle *up* intensive.

Nilus opens wide
His arms, and ample bosom to the tide,

And spreads his mantle o'er the winding coast;
In which he *wraps* his queen, and hides the flying host.

Dryden.

To comprise; to contain.—Leontine's young wife, in whom all his happiness was *wrapt up*, died in a few days after the death of her daughter. *Addison.*

To WRAP up. To involve totally.

Some dear cause
Will in concealment *wrap me up* a while;
When I am known aright, you shall not grieve
Lending me this acquaintance. *Shakspeare.*

[It is often corruptly written for *rap* or *rape*, from *rapio*, Latin.] To snatch up miraculously.—Whatever things were discovered to St. Paul, when he was *wrapped up* into the third heaven, all the description he makes is, that there are such things as eye hath not seen, ear heard, nor hath it entered into the heart of man to conceive. *Locke.*—To transport; to put in extasy: for *rapt*.

Much more the reverent sire prepar'd to say,
Wrapp'd with his joy; how the two armies lay. *Cowley.*

[Perhaps the following passage should properly be *wrapped*; though *wrapped* is now frequently used in this sense.]—*Wrapp'd* in amaze the matrons wildly stare. *Dryden.*

WRAPPER, *s.* One that wraps. That in which any thing is wrapped.—My arms were pressed to my sides, and my legs closed together by so many *wrappers*, that I looked like an Egyptian mummy. *Addison.*

WRA'PPING, *s.* That in which any thing is wrapped.—The sheep that is near at hand, gives us shelter enough from the cold; why should we hunt after more costly furs and *wrappings*? *Bp. Rainbow.*

WRATH, *s.* [p̄rað, Saxon; Horne Tooke pronounces it the past participle of the Saxon p̄raðan, torquere, to *writhe*.] Anger; fury; rage.

Achilles' *wrath*, to Greece the direful spring
Of woes unnumber'd heav'nly goddess, sing. *Pope.*

WRATH, CAPE, a dangerous promontory of Scotland, in Sutherland, being the north-west corner of the mainland of Scotland. Lat. 58. 40. N. long. 4. 58. W.

WRATHFUL, *adj.* Angry; furious; raging.—How now, your *wrathful* weapons drawn! *Shakspeare.*

WRA'THFULLY, *adv.* Furiously; passionately.

— Gentle friends,

Let's kill him boldly, but not *wrathfully*. *Shakspeare.*

WRA'THLESS, *adj.* Free from anger. Before his feet, so sheep and lions lay,
Fearless and *wrathless*, while they heard him play. *Waller.*

WRATTING, GREAT and LITTLE, adjoining parishes of England, in Suffolk; about 6 miles west-by-north of Clare.

WRATTING, WEST, a parish of England, in Cambridge; 47 miles north-by-east of Linton. Population 586.

WRAWBY, a parish of England, in Lincolnshire; 2 miles north-east of Glanford Bridge.

To WRAWL, *v. n.* To cry as a cat.

Some were of dogs that barked day and night,
And some of cats that *wrawling* still did cry. *Spenser.*

WRAXALL, a parish of England, in Dorsetshire; 6½ miles west-by-south of Bristol.

WRAXALL, NORTH, a parish of England, in Wiltshire; 7 miles west-by-north of Chippenham.

WRAXALL, SOUTH, a hamlet in the above county; 6 miles west-by-north of Melksham.

WRAXHALL, a parish of England, in Dorsetshire; 8 miles from Beaminster.

WRAY, or WREA, a township of England, in Lancashire, near Kirkham.

WRAY, another township in the above county; 10½ miles north-east of Lancaster. Population 623.

WRAY, a hamlet of England, in Cumberland; 6 miles south-east of Carlisle.

WRAYTON, a township of England, in Lancashire; 13 miles north-east of Lancaster.

To WREAK,

To WREAK, *v. a.* Old preterite and part. pass. *wroke* and *wroken*; now *wreaked*. It is likely that the word *wrought*, which is only used in the past tense, is originally the preterite of *wreak*. [ppæcan, Saxon; *wrecken*, Dutch; *recken*, German.] To revenge.

In an ill-hour thy foes thee hither sent,
Another's wrongs to *wreak* upon thyself. *Spenser.*

Pale death our valiant leader hath opprest,
Come *wreak* his loss, whom bootless ye complain. *Fairfax.*

To execute any violent design. This is the sense in which it is now used.

He left the dame,
Resolv'd to spare her life, and save her shame,
But that detested object to remove,
To *wreak* his vengeance, and to cure her love. *Dryden.*

It is corruptly written for *reck*, to heed; to care.
My master is of churlish disposition,
And little *wreaks* to find the way to heav'n
By doing deeds of hospitality. *Shakspeare.*

WREAK, *s.* Revenge; vengeance. *Obsolete.*
Fortune, mine avowed foe,
Her wrathful *wreaks* themselves do now allay. *Spenser.*
Passion; furious fit. *Obsolete.*

What and if
His sorrows have so overwhelm'd his wits,
Shall we be thus afflicted in his *wreaks*.
His fits, his frenzy, and his bitterness? *Shakspeare.*

WRE'AKFUL, *adj.* Revengeful; angry. *Not in use.*

Call the creatures,
Whose naked natures live in all the spite
Of *wreakful* heaven. *Shakspeare.*

WRE'AKLESS, *adj.* Unrevenging.
So flies the *wreakless* shepherd from the wold;
So first the harmless flock doth yield his fleece,
And next his throat unto the butcher's knife. *Shakspeare.*

WREATH, *s.* [pæoð, Saxon, from ppiðan, torquere.]
Any thing curled or twisted.

Clouds began
To darken all the hill, and smoke to roll
In dusky *wreaths* reluctant flames. *Milton.*

A garland; a chaplet.
Now are our brows bound with victorious *wreaths*,
Our bruised arms hung up for monuments. *Shakspeare.*

To WREATH, *v. a.* pret. *wreathed*; part. pass. *wreathed, wreathen*. [ppiðan, Saxon.] To curl; to twist; to convolve.

Longaville
Did never sonnet for her sake compile,
Nor ever laid his *wreathed* arms athwart
His loving bosom to keep down his heart. *Shakspeare.*

It is here used for, *to writhe*.
Impatient of the wound,
He rolls and *wreaths* his shining body round:
Then headlong shoots beneath the dashing tide. *Gay.*

To interweave; to entwine one in another.—Two chains
of pure gold of *wreathen* work shalt thou make them, and
fasten the *wreathen* chains to the ouches. *Ex.*—To encircle
as a garland.

In the flow'rs that *wreathe* the sparkling bowl,
Fell adders hiss, and pois'nous serpents rowl. *Prior.*

To encircle as with a garland; to dress in a garland.
For thee she feeds her hair,
And with thy winding ivy *wreathes* her lance. *Dryden.*

To WREATH, *v. n.* To be interwoven; to be inter-
twined.

Here, where the labourer's hands have form'd a bow'r
Of *wreathing* trees, in singing waste an hour. *Dryden.*

WRE'ATHY, *adj.* Spiral; curled; twisted.—That which
is preserved at St. Dennis, near Paris, hath *wreathy* spires,
and cochleary turnings about, which agreeth with the de-
scription of an unicorn's horn in Ælian. *Brown.*—Covered
with a wreath.

Less mild the Bacchanalian dames appear,
When from afar their mighty god they hear,
And howl about the hills, and shake their *wreathy* spear. *Dryden.*

WRECK, *s.* [ppucan, Sax, persequi, affligere, lædere, perdere.] Destruction by being driven on rocks or shallows
at sea; destruction by sea.

Fair be ye sure; but hard and obstinate,
As is a rock amidst the raging floods;
'Gainst which a ship, of succour desolate,
Doth suffer *wreck* both of herself and goods. *Spenser.*

Dissolution by violence.
Not only Paradise,
In this commotion, but the starry cope
Had gone to *wreck*. *Milton.*

Ruin; destruction.
Whether he was
Combin'd with Norway, or did line the rebel
With hidden help and vantage; or that with both
He labour'd in his country's *wreck*, I know not. *Shakspeare.*

It is misprinted here for *wreak*.
He cry'd as raging seas are wont to roar,
When wintry storm his wrathful *wreck* doth threat. *Spenser.*

The thing wrecked: as, the ship was considered as a *wreck*.
That most ungrateful boy there by your side
From the rude sea's enrag'd and foamy mouth
Did I redeem; a *wreck* past hope he was. *Shakspeare.*

Dead, undigested stems of grasses and weeds in a ploughed
land. *Norfolk. Grose.*
To WRECK, *v. a.* To destroy by dashing on rocks or
sands.

A pilot's thumb,
Wreck'd as homeward he did come. *Shakspeare.*
To ruin.
Weak and envy'd, if they should conspire,
They *wreck* themselves, and he hath his desire. *Daniel.*

In the following passage it is used for *wreak*.
Eighty odd years of sorrow have I seen,
And each hour's joy *wreck'd* with a week of teen. *Shakspeare.*

To WRECK, *v. n.* To suffer wreck.
With manlier objects we must try
His constancy, with such as have more shew
Of worth, of honour, glory, and popular praise,
Rocks whereon greatest men have ofttest *wreck'd*. *Milton.*

WRE'CKFUL, *adj.* Causing wreck.
Thereto they us'd one most accursed order,
To eat the flesh of men whom they mote fynde,
And strangers to devoure, which on their border,
Were brought by error, or by *wreckfull* wynde. *Spenser.*

WRECK REEF BANK, a reef of rocks in the South
Pacific ocean, on which captain Flinders, on board the Por-
poise and the Cato of London, struck, when on their voyage
from Port Jackson northward, in order to pass through
Torres strait. It is about 20 miles long, and from a quarter
to one mile and a half in breadth; and consists of many
distinct patches of different magnitude, some above and some
below water. A sand-bank lies within a mile of the rock on
which captain Flinders struck, and to which the crews of
both vessels were indebted for their safety. Lat. of this bank,
22. 11. 23. S. long. 155. 18. 50. E.

WREIGHILL, a township of England, in Northumberland; 15 miles west-south-west of Alnwick.

WREKIN, a river of England, in Lancashire, which falls into the Stour.

WREKIN, a noted hill of England, lying to the east of Shrewsbury, in Salop, 1200 feet high.

WRELTON, a township of England, in Yorkshire; 2½ miles west-north-west of Pickering.

WREN (Sir Christopher), an eminent architect and mathematician, was born in 1632, at the living of his father, who was rector of East Knoyle, in Wiltshire, and finished his education at Wadham college, Oxford, into which he entered in 1646. Before this time, he had given proofs of genius by the invention of astronomical and pneumatic instruments; the former of which he dedicated to his father, at the age of 13, in a copy of elegant Latin verses, together with an exercise "De Ortu Fluminum." He also distinguished himself by the construction of other philosophical instruments; and in 1647 he wrote a treatise on Spherical Trigonometry upon a new plan. In 1650 he graduated B.A., and in 1651 wrote an algebraical tract on the Julian period. In 1653 he was elected fellow of All-Souls' college, and graduated M.A. He was one of the first members of the Philosophical Society at Oxford, from which proceeded the Royal Society, and contributed by his experiments and inventions to the amusement and instruction it afforded; and in 1663 he was elected a fellow of the Royal Society. In 1657 he was chosen astronomical professor at Gresham college; but upon being appointed Savilian professor of astronomy at Oxford, he resigned the former office, and in 1661 returned to the university, which created him doctor of laws. Wren next presents himself to our view as a pre-eminent architect; and thus distinguished, he received a commission in 1663 to prepare designs for the repair of St. Paul's cathedral; and after his return from a tour to France in 1665, with a view to his improvement in architecture, he finished those designs; but whilst they were under consideration, the edifice was destroyed by the fire of London in 1666. This catastrophe afforded him an opportunity of designing and constructing a building altogether new. The contemporary destruction of 50 parochial churches and many public buildings furnished ample scope for the exercise of Wren's talents; and he would have had the honour of refounding, as it were, a new city, if the design which he laid before the king and parliament could have been accomplished without infringing on the rights of private property. On the death of Sir John Denham in 1667, he succeeded to the office of surveyor of the works; and, in order to obtain leisure for executing the various works in which he was employed, and more particularly the rebuilding of St. Paul's cathedral, he resigned his Savilian professorship in 1673. In 1674 he received the honour of knighthood, and in the following year the foundation of the new cathedral was laid. For a particular account of this magnificent edifice, see the article LONDON. In 1680 Sir Christopher's scientific merits caused him to be elected president of the Royal Society. In 1683 he was appointed architect and commissioner for Chelsea college, and in the following year comptroller of the works in the castle of Windsor. In 1685 he was introduced into parliament as a representative of Plympton. To his other public trusts were added, in 1698, that of surveyor-general and commissioner for the repair of Westminster abbey; in 1699 that of architect of Greenwich hospital; and in 1708 that of one of the commissioners for the 50 new churches proposed to be erected in and near the city of London. Having fulfilled all his duties to the 86th year of his age, the administration of 1718 incurred indelible disgrace, by suffering political consideration to have such influence as to deprive him of his place of surveyor to the royal works. The remaining five years of his life were spent in honourable retirement, and devoted to scientific pursuits, and the reading of the Scriptures. It is said that he indulged a very pardonable vanity by being carried once every year to survey St. Paul's cathedral. His life was prolonged to his 91st year, and terminated in consequence of a cold which he caught in coming

from Hampton-Court to London, in February, 1723. His remains were interred, with suitable funeral honours, under the choir of St. Paul's, and upon his tomb is a concise but very appropriate and expressive Latin inscription, ending "Lector, si monumentum requiris, circumspice." Sir Christopher was twice married, and left one son, a man of learning and piety, and a good antiquary. The edifices constructed by Wren were mostly public, including a royal hunting-seat at Winchester, and the modern part of the palace at Hampton-Court. Some of the most remarkable, besides St. Paul's, are, the Monument, the theatre at Oxford, the library of Trinity college, Cambridge, the hospitals of Chelsea and Greenwich, and of Christchurch, London, the church of St. Stephen, Walbrook, those of St. Mary-le-Bow, St. Michael, Cornhill, and St. Bride, distinguished by their steeples, and the great campanile of Christchurch, Oxford. Of the rank which he occupied as a man of science, we may form some judgment from the succeeding concise detail of his performances, and more particularly from the testimony of Sir Isaac Newton, who, in his "Principia," joins the names of Wren, Willis, and Huygens, and characterizes them as "hujus ætatis Geometrarum facile principes." As to his moral character, it is said to have been worthy of his intellectual eminence; as with great equanimity, he was pious, temperate, modest, and communicative of his knowledge; and few men seem to have been more generally esteemed by their contemporaries. With regard to his architectural skill and attainments, a very competent judge, being himself of the profession, says, that he possessed an inexhaustible fertility of invention, combined with good natural taste and profound scientific knowledge; and that his talent was particularly adapted to ecclesiastical architecture, which afforded domes and towers to his picturesque fancy; while, in his palaces and private houses, he has sometimes sunk into a heavy monotony, as at Hampton-Court and Winchester. Among the rich variety of Wren's towers, steeples, and spires, many are truly elegant. The church of St. Stephen's, Walbrook, exhibits a deviation from common forms equally ingenuous and beautiful. The Monument is grand and simple. At Greenwich, his additions to the original work of Inigo Jones are singularly grand and beautiful. Upon the whole, Sir C. Wren's architecture is perhaps the perfection of that modern style which, with forms and modes of construction essentially Gothic, adopts for the decorative part the orders and ornaments of antiquity. *Biog. Brit. Walpole's Anecd. Gen. Biog.*

WREN, *s.* [ppenna, Saxon; *regulus*, Lat.] A small bird.

The poor *wren*,

The most diminutive of birds, will fight,
Her young ones in her nest, against the owl. *Shakspeare.*

WRENBURY, a township of England, in Cheshire; 5 miles south-west of Nantwich. Population 455.

To WRENCH, *v. a.* [ppungan, Saxon; *wrenghen*, Dutch; old Engl. *raunch*. "Hasting to *raunch* the arrow out." *Spenser.*] To pull by violence; to wrest; to force.

Oh form!

How often dost thou with thy case, thy habit,
Wrench' awe from fools, and tie the wiser souls
To thy false seeming! *Shakspeare.*

To sprain; to distort.

O most small fault!

How ugly didst thou in Cordelia show?
Which, like an engine, *wrencht* my frame of nature
From the fix'd place; drew from my heart all love,
And added to the gall. *Shakspeare.*

You *wrenched* your foot against a stone, and were forced to stay. *Swift.*

WRENCH, *s.* A violent pull or twist; a sprain.—Some small part of the foot being injured by a *wrench*, the whole leg thereby loses its strength. *Locke.*—*Wrenches*, in Chaucer, signifies means, sleights, subtilties; which is; I believe, the sense here.—He resolved to make his profit of this business

ness of Britain, as a quarrel for war; and that of Naples as a *wrench* and mean for peace. *Bacon*.

WRENINGHAM, a parish of England, in Norfolk; 4 miles south-east of Wymondham. Population 397.

WRENTHAM, a parish of England, in Suffolk; 5 miles north-by-west of Southwold. Population 750.

WRENTHAM, a post township of the United States, in Norfolk county, Massachusetts; 32 miles south-west of Boston. It is a considerable town, and contains an academy and a cotton manufactory. Great numbers of straw bonnets are made in this town. Population 2478.

WRENTHORPE, a hamlet of England, in Yorkshire; parish of Wakefield.

WRESCHEN, or WRESZNO, a town of Prussian Poland; 14 miles south-by-west of Gnesna, with 2100 inhabitants.

WRESSEL, a township of England, in Yorkshire; 3½ miles north-west of Howden.

WRESSEN, a hamlet of England, in the parish of Kentisbeare, Devonshire.

To WREST, *v. a.* [wrestan, Sax.] To twist by violence; to extort by writhing or force.

To what wretched state reserv'd,
Better end here unborn! Why is life giv'n,
To be thus *wrested* from us?

Milton.

To distort; to writhe; to force.

My father's purposes have been mistook,
And some about him have too lavishly
Wrested his meaning and authority.

Shakspeare.

To wind; to screw; applied to the tuning of instruments. *Obsolete. Minshieu.*

The claricord hath a tunely kynde,
As the wyre is *wrested* high and lowe.

Skelton.

WREST, *s.* Distortion; violence.—Whereas it is concluded, out of weak premises, that the retaining of divers things in the church of England, which other reformed churches have cast out, must needs argue that we do not well, unless we can shew that they have done ill: what needed this *wrest*, to draw out from us an accusation of foreign churches? *Hooker*.—It is used in Spenser for an active or moving power; I suppose, from the force of a tilter acting with his lance in his rest.

Adown he kest it with so puissant *wrest*,
That back again it did aloft rebound,
And gave against his mother earth a groneful sound.

Spenser.

An instrument to tune.—The minstrel tempered a string or two with his *wrest*.

Lanham.

Antenor is such a *wrest* in their affairs,
That their negotiations all must slacken,
Wanting his manage.

Shakspeare.

WRESTER, *s.* One who wrests; one who uses a wrest. Any instrument mistunyd shall hurt a true song, Yet blame not the claricord the *wrester* doth wrong.

Skelton.

To WRESTLE, *v. n.* To contend who shall throw the other down.—If ever he goes alone again, I'll never *wrestle* for prize more. *Shakspeare*.—To struggle; to contend; followed by *with*.

I persuaded them, if they lov'd Benedick,
To wish him *wrestle with* affection,
And never to let Beatrice know of it.

Shakspeare.

To WRESTLE, *v. a.* To overcome in wrestling.

Life recover'd had the reine,
And over-*wrestled* his strong enemy.

Spenser.

WRESTLER, *s.* One who wrestles; one who professes the athletic art.

When the young *wrestlers* at their sport grew warm,
Old Milo wept, to see his naked arm.

Denham.

One who contends in wrestling.—Two *wrestlers* help to pull each other down.

Dryden.

WRESTLINGWORTH, a parish of England, in Bedfordshire; 5½ miles east-north-east of Biggleswade.

Vol. XXIV. No. 1670.

WRETCH, *s.* [wrecca, wraec, Sax. from wrican, Goth. *wrikan*, persequi, affligere, punire, vindicare, ulcisci, lædere, perdere. *Mr. H. Tooke*.] A miserable mortal.

She weeps, and says her Henry is depos'd;
He smiles, and says his Edward is install'd;
That she, poor *wretch*, for grief can speak no more.

Shakspeare.

A worthless sorry creature.

He now

Has these poor men in question: never saw I
Wretches so quake; they kneel, they kiss the earth,
Forswear themselves as often as they speak.

Shakspeare.

It is used by way of slight, or ironical pity, or contempt.

When soon away the wasp doth go;
Poor *wretch* was never frighted so:
He thought his wings were much too slow,
O'erjoy'd they so were parted.

Drayton.

Then, if the spider find him fast beset,
She issues forth, and runs along her loom:
She joys to touch the captive in her net,
And drags the little *wretch* in triumph home.

Dryden.

It is sometimes a word of tenderness, as we now say *poor thing*.—Excellent *wretch*.

Shakspeare.

WRETCHED, *adj.* Miserable; unhappy.

Why do'st thou drive me

To range all o'er a waste and barren place,
To find a friend? The *wretched* have no friends.

Dryden.

Calamitous; afflictive.—Sorry; pitiful; paltry; worthless.—Forgive the many failings of those who, with their *wretched* art, cannot arrive to those heights that you possess. *Dryden*.—Despicable; hatefully contemptible.—An adventure worthy to be remembered for the unused examples therein, as well of true natural goodness as of *wretched* ungratefulness. *Sidney*.

WRETCHEDLY, *adv.* Miserably; unhappily.—From these two wars, so *wretchedly* entered into, the duke's ruin took its date. *Clarendon*.—Meanly; despicably.—When such little shuffling arts come once to be ripped up, and laid open, how poorly and *wretchedly* must that man sneak, who finds himself guilty and baffled too? *South*.

WRETCHEDNESS, *s.* Misery; unhappiness; afflicted state.

I love not to see *wretchedness* o'ercharg'd,
And duty in his service perishing.

Shakspeare.

Pitifulness; despicableness.

WRETCHLESS, *adj.* [This is written for *reckless*.] Careless; mindless; heedless.—If persons of so circumspect a piety have been thus overtaken, what security can there be for our *wretchless* oscitancy. *Gov. of the Tongue*.

WRETCHLESSNESS, *s.* Carelessness.—The devil drives them into desperation, or into *wretchlessness* of unclean living. *Art. of Rel.*

WRETHAM, EAST AND WEST, united parishes of England, in Norfolk; 6 miles north-east of Thetford.

WRETTON, a parish of England, in Norfolk; one mile west of Stoke Ferry.—Also a hamlet in Cheshire.

WREXHAM, a market town of Wales, in Denbighshire. Its situation is very fertile and pleasant, adjoining the royal vale of Cheshire. Its principal trade arises from its central situation, being a great thoroughfare. The streets, crossing each other reciprocally at right angles, are spacious, and the buildings in general good, particularly the High-street, where the weekly markets on Mondays and Thursdays are held; at the upper end of which is a handsome structure, a public edifice of the Doric order, the upper apartment used as a municipal hall, and the piazza part below, as a kind of diurnal mart. The church is an elegant structure, equal in point of beauty to some of the cathedrals in England; it was collegiate before the reign of Henry VII. when the present edifice was erected on the site of the old one, which was destroyed by fire. This beautiful edifice, which is 178 feet long and 72 broad, and has a tower 185 feet high, consists

sists of a chancel, pentagonal in shape, nave, two collateral aisles, and a lofty quadrangular tower at the west end. The windows of the aisles have a flat pointed arch, and the mullions are ornamented at top with tracery; between which are buttresses, terminating in slender crocketed pinnacles. The windows of the chancel are narrower than those of the aisles, the arches rather approximating to the sharp pointed style, and the embattled parapet has diminishing crocketed pinnacles, corresponding with those of the aisles. The tower, elevated 135 feet, is a *chef d'œuvre* of architectural display. The shape is quadrangular, with handsome set-off abutments, terminating in crocketed pinnacles, and the summit is crowned by four pierced lantern turrets, that rise 24 feet in height, above the open-worked balustrade, to each of which is attached a circular staircase. The three exposed sides are decorated with various embellishments. Statues of 30 saints, full in dimensions, placed in the niches of the buttresses, while they enrich the building, display the advanced progress statuary had made at the close of the 15th century. The ceiling of the roof is peculiarly handsome; being composed of ribs in wainscot oak, imitative of the grained work in stone, of the antecedent period. The corbels, supporting the bearing timber, are carved; and grotesque heads, with various shields, exhibit the arms of some few among the number of those who, by their advice or pecuniary aid, promoted the erection of the edifice. At the west end of the nave is a grand receding pointed arch, nearly the height of the building, filled by a window once ornamented with elegantly painted glass, which is now so mutilated, as nearly to mar all attempts to ascertain the subject. They have attempted to compensate the loss by a few diminutive figures that decorate the upper compartments of the windows in the aisles. The altar-piece is peculiarly beautiful, and is ornamented with a fine painting of the Lord's Supper, which is supposed to be by Rubens. There is also another picture by the same master, representing king David playing on the harp, to divert the melancholy of Saul, hung up in a massy frame, against the wall of the south aisle. The inside of the church is ornamented with a number of monuments, some of them exceedingly handsome. There are also several good monuments in the church-yard, a few of which with curious inscriptions. In 1647 this church was made a prison by Cromwell, when his soldiers destroyed the organ. Near Wrexham are still some remains of the famous dyke thrown up by Offa, king of Mercia, to prevent the incursions of the Welsh. Market on Thursday and Monday; the former is the principal.

Wrexham is noted for one of those annual fairs which used to be general throughout the kingdom. It is frequented not only by persons in the adjacent districts, but by traders from divers and far distant parts of the kingdom. The commodities brought by the Welsh, are flannels of all staple, and various linens, linsey-woolseys, coarse linens, horses, sheep, and black cattle. The remote dealers bring Irish linens, Yorkshire and other woollen cloths, with Manchester, Sheffield, and Birmingham goods, in all their varieties. Two squares, or areas, are fitted up with booths, and temporary shops, for the accommodation of sale; and at this public mart, which commences March 23d, and continues for nine days inclusive, the sales are very extensive. There are two other fairs on the 6th June and 19th September; 16 miles from Ellesmere, and 188 north-west of London. Population 3006.

WRIBBENHALL, a hamlet of England, in Worcestershire, near Kidderminster.

WRIDLINGTON, a hamlet of England, in Dorsetshire, near Dorchester.

WRIEZEN, a small town of the Prussian states, in the province of Brandenburg on the Oder; 37 miles east-by-north of Berlin, with 3200 inhabitants.

To WRIG, *v. a.* [wɹɪʒən, Sax.] To move to and fro; to rub; to shake; to put into quick motion.

The bore his taile *wrygges*
Against the lye bench.

Skelton.

To WRIGGLE, *v. n.* [wɹɪʒən, Saxon; *ruggelen*, Dutch.] To move to and fro with short motions.

How wildly will ambition steer!
A vermin *wriggling* in th' usurper's ear. *Dryden.*

To WRIGGLE, *v. a.* To put in a quick reciprocating motion; to introduce by shifting motion.

Ralpho was mounted now, and gotten
O'erthwart his beast with active vaulting,
Wriggling his hody to recover
His seat, and cast his right leg over. *Hudibras.*

WRIGGLE, *adj.* Pliant; flexible; moving to and fro. My ragged ronts all shiver and shake;
They went in the wind wagg their *wriggle* tails,
Peark as a peacoke, but nought it avails. *Spenser.*

WRIGGLETON, or WRITHLINGTON, a parish of England, in Somersetshire; 6½ miles north-west of Frome.

WRIGHT, *s.* [wɹɪhta, wɹɪhta, Saxon. The third person of the indicative of wɹycan, one that *worketh*. Mr. H. Tooke. See To WORK.] A workman; an artificer; a maker; a manufacturer.

Nor place the neighbour Cyclops their delights,
In brave vermilion prow deckt ships; nor *wrights*
Useful and skillful. *Chapman.*

WRIGHT (Edward), an English mathematician, flourished in the latter part of the 16th and beginning of the 17th century. Of his private history little is known, except some few particulars that may be collected from the Latin memoirs of his life, preserved among the annals of Gonville and Caius college in Cambridge. "This year (1615) died, it is said, at London, Edward Wright, of Garveston in Norfolk, formerly a fellow of this college, much respected for the integrity and simplicity of his manners, and also famous for his skill in the mathematical sciences. He was the first undertaker of the difficult but useful work, by which a little river is brought from the town of Ware, in a new canal, to supply the city of London with water; but by the tricks of others he was prevented from completing it. Nor was he inferior to the most ingenious mechanic in the construction of instruments, either of brass or of any other matter. He, it is said, taught Iodocus Hondius the method of constructing his geographical charts, though Hondius concealed his name, that he might arrogate to himself the honour of the invention. Of this act of injustice, Wright complained in the Preface to his 'Treatise of the Correction of Errors in the Art of Navigation,' a work composed with excellent judgment, and after long experience, to the great advancement of naval affairs. For his improvement of this art he was appointed mathematical lecturer to the East India Company; and he read lectures, for which he was allowed a yearly salary of 50*l.* This office he discharged with great reputation, and much to the satisfaction of his hearers. He published, in English, a book on the doctrine of the sphere, and another concerning the construction of sundials. He also prefixed an ingenious preface to the learned Gilbert's book on the load-stone. By these and other writings he transmitted his fame to the latest posterity. It is added, whilst he was a fellow of this college, he was called forth to the public business of the nation by the queen, about the year 1593, or, according to other accounts, 1589. He was ordered to attend the earl of Cumberland in some maritime expeditions; of one of which he gave a faithful account, under the form of a journal or ephemeris, prefixing to it an elegant hydrographical chart of his own invention. His posthumous work, which was an English translation of the book of logarithms, then lately discovered by lord Napier, a friend of Mr. Wright, was published soon after his death by his son Samuel Wright, a scholar of the above-named college. Death prevented the execution of several other designs which he had formed. Of him it may be truly said, that he studied more to serve the public than himself; and though he was rich in fame and in the promises of the great, he died poor, to the scandal of an ungrateful age." To the preceding extracts from the memoirs above cited, we may

may add, that Mr. Wright first discovered the true method of dividing the meridian line, according to which Mercator's charts are constructed, and upon which his sailing is founded. An account of it was sent from Cambridge to Mr. Blondeville, who published it among his exercises in 1594; and in 1597 a demonstration of it was given by the Rev. Mr. William Barlowe, in his "Navigator's Supply." In 1599 Mr. Wright published "The Correction of certain Errors in Navigation," written many years before, and shewing the reason of his division of the meridian, the manner of constructing his table, and its uses in navigation, &c. &c. In 1610 he dedicated a second edition to his royal pupil, prince Henry, with farther improvements, and an excellent method for determining the magnitude of the earth. To his other works, comprehending an account of his various discoveries, tables, and improved instruments for observation, we shall add his tract on navigation, entitled "The Haven-finding Art." It is said that he constructed, for the use of prince Henry, a large sphere with curious movements, serving by spring-work to exhibit the motions of the whole celestial sphere, the particular systems of the sun and moon, their circular motions, places, and possibilities of eclipsing each other. This sphere was overlooked in the time of the civil wars, and found among dust and rubbish in 1646 by Sir Jonas Moore, who was at the expense of restoring it to its original state, and deposited it at his own house in the Tower, among other mathematical instruments. *Preface to Robertson's Navigation. Hutton's Math. Dict.*

WRIGHT (Richard), was a native of Liverpool, and born about the year 1735. He was bred to the humble occupation of a house and ship painter, but exerted his talents in painting sea views, and obtained for his encouragement the premium offered in 1764 by the society for the encouragement of arts, &c.; and in 1766 he gained another premium of fifty guineas, for a picture which had the greater credit of being most beautifully engraved by Woollett, and is known under the name of the "Fishery." He died about 1775.

WRIGHT (Joseph), one of our earliest painters of celebrity in this age of restoration of the art. He was born at Derby in 1734, and thence obtained the name of Wright of Derby, to distinguish him from R. Wright mentioned above. He came to London to study with Hudson, but afterwards established himself at his native place, and had very considerable encouragement as a portrait-painter, though his style was dry and too minute. He gained much more reputation by painting scenes of fire and candle-light, and indeed stood unrivalled in that way till Louthborough subsequently appeared. His pictures of a forge and of a blacksmith's shop, exhibited with the society of artists about the year 1765, established his reputation. In 1773 he visited Rome, and Italy generally, and was absent two years. In 1782 he was elected an associate of the Royal Academy, but resigned his diploma soon after, on Mr. Garvey's being preferred to him in an election for an academician; though he continued occasionally to exhibit with the academy. He had great industry and professional skill, living very much apart from the world. This enabled him to produce many pictures; and in 1785 he made an exhibition of twenty-four pictures of his own painting at the great room under the Piazza, Covent-garden, one of which was a large work representing the destruction of the floating batteries before Gibraltar. His style in all his works was peculiar to himself, somewhat dry, yet not void of richness, and his drawing coldly correct. One peculiarity marks his pictures, and renders them easily distinguishable, especially those in which the illumination proceeds from the moon or fire. He prepared his cloths or grounds with rough surfaces, caused by sand sifted or strewed upon them; and then when he had painted his scene, he dragged his pallet-knife, covered with the colour of the light, across the picture, when the colour adhering to the projections on the surface, gave the glitter which characterizes that kind of illumination, and he toned the parts to due relief by glazings. No one ever gave the

exact tone of moon-light so completely as Wright of Derby. He died in 1797, aged 63.

WRIGHTINGTON, a township of England, in Lancashire; 4 miles north-west of Wigan. Population 1268.

WRIGHTSBOROUGH, a post village of the United States, in Columbia county, Georgia.

WRIGHTSBURG, a township of the United States, in Ashtabula county, Ohio, on Lake Erie.

WRIGHTSTOWN, a post township of the United States, in Bucks county, Pennsylvania; 5 miles from Newhaven.

WRIGHTSVILLE, a post village of the United States, in York county, Pennsylvania, on the west side of the Susquehanna, opposite Columbia, with which it is connected by a bridge.

WRINEHILL, a hamlet of England, in Staffordshire; 4 miles from Newcastle-under-Lyne.

To WRING, *v. a.* preter. and part. pass. *wringed* and *wring*. [p̄w̄ngan, Saxon.] To twist; to turn round with violence.—The priest shall *wring* off his head, and burn it on the altar. *Lev.*—To force by contortion; with a particle, as *out*.—He thrust the fleece together, and *wringed* the dew *out* of it, a bowl full of water. *Judg.*—To squeeze; to press.

In sleep I heard him say, sweet Desdemona,

Let us be wary, let us hide our loves!

And then, Sir, would he gripe and *wring* my hand.

Shakspeare.

To writhe.

The silly owner of the goods

Weeps over them, and *wrings* his hapless hands.

Shakspeare.

To pinch.—The king began to find where his shoe did *wring* him, and that it was his depressing the house of York that did rankle and fester the affections of his people. *Bacon.*—To force by violence; to extort.

I had rather coin my heart,

And drop my blood for drachmas, than to *wring*

From the hard hands of peasants their vile trash

By any indirection.

Shakspeare.

To harass; to distress; to torture.

He dives into the king's soul, and there scatters

Doubts, dangers, *wringing* of the conscience.

Fear and despair, and all these for his marriage. *Shakspeare.*

To distort; to turn to a wrong purpose.—To *wring* this sentence, to wrest thereby out of men's hands the knowledge of God's doctrine, is without all reason. *Ascham.*—To persecute with extortion.—The merchant-adventurers have been often wronged and *wringed* to the quick; but were never quick and lively in thanks to those by whose endeavours they were freed. *Hayward.*

To WRING, *v. n.* To writhe with anguish.

'Tis all men's office to speak patience

To those that *wring* under the load of sorrow:

But no man's virtue nor sufficiency,

To be so moral when he shall endure

The like himself.

Shakspeare.

WRING, *s.* Action of anguish.—The sighs, and tears, and *wrings* of a disconsolate mourner. *Bp. Hall.*

WRINGER, *s.* One who squeezes the water out of clothes.—One Mrs. Quickly is in the manner of his nurse, his laundress, his washer, and his *wringer*. *Shakspeare.*

WRINGTON, a market town of England, in the county of Somerset, pleasantly situated among the Mendip hills. The streets are irregularly built, and most of the houses thatched. The church is a stately building, 120 feet long and 52 wide. It consists of a nave, chancel, side aisles, and a porch, embattled at the top, and ornamented with a variety of handsome pinnacles. The tower, rising at the west end, is one of the finest in the kingdom: it is 140 feet high to the top of the battlements, which are adorned with four turrets, one at each corner, and sixteen elegant Gothic pinnacles, 15 feet high. This church contains several neat monuments, both ancient and modern. Here is a free school, for six boys and as many girls. The remains

remains of a cross are to be seen in the market-place. Abundance of teazles grow in the neighbourhood, which form a species of trade, from their use in dressing cloth; and some lapis calaminaris is dug and prepared near the town. This town was the birth-place of Locke. Market on Tuesday, well supplied with corn, &c.; and a fair on Michaelmas day; 12 miles south of Bristol. Population 1109.

WRINGWORTHY, a hamlet of England, in Devonshire, near Tavistock.

WRINKLE, *s.* [wringel, Saxon; *wrinkel*, Dutch.] Corrugation or furrow of the skin or the face.

Give me that glass, and therein will I read:
No deeper wrinkles yet? Hath sorrow struck
So many blows upon this face of mine,
And made no deeper wounds?

Shakspeare.

Rumple of cloth.—Any roughness.

Our British heaven was all serene;
No threating cloud was nigh,
Not the least wrinkle to deform the sky.

Dryden.

To WRINKLE, *v. a.* [wringlian, Saxon.] To corrugate; to contract into furrows.

It is still fortune's use
To let the wretched man outlive his wealth,
To view with hollow eye and wrinkled brow
An age of poverty.

Shakspeare.

To make rough or uneven.

A keen north-wind, blowing dry,
Wrinkled the face of deluge as decay'd.

Milton.

WRISSA, a town of Hindostan, province of Sinde, and district of Tatta. It is situated on the west bank of the river Indus. Lat. 24. 55. N. long. 68. 25. E.

WRIST, *s.* [wrist, Saxon; from *wrætan*, to torque. *Mr. H. Tooke.*] The joint by which the hand is joined to the arm.—The brawn of the arm must appear full, shadowed on one side; then shewn the wrist-bone thereof. *Peacham.*—The axillary artery, below the cubit, divideth unto two parts, the one running along the radius, and passing by the wrist, or place of the pulse, is at the fingers subdivided into three branches. *Brown.*

WRISTBAND, *s.* [wrist and band.] The fastening of the shirt at the hand.

You'll—dip your wristbands
(For cuffs y' have none) as comely in the sauce
As any courtier.

Beaumont and Fl.

WRIT, *s.* Anything written; Scripture. This sense is now chiefly used in speaking of the Bible.—Bagdat rises out of the ruins of the old city of Babylon, so much spoken of in holy writ. *Knolles.*—A judicial process, by which any one is summoned as an offender.

Hold up your head; hold up your hand:
Wou'd it were not my lot to shew ye
This cruel writ, wherein you stand
Indicted by the name of Cloe.

Prior.

A legal instrument.

The king is fled to London,
To call a present court of parliament:
Let us pursue him ere the writs go forth.

Shakspeare.

WRIT. The preterite of write.

When Sappho writ,
By their applause the critics show'd their wit.

Prior.

WRIT, formed from the Saxon *writan*, to write, *Breve*, a precept of the king in writing, under seal, issuing out of some court to the sheriff or other person, whereby any thing is commanded to be done, touching a suit or action, or giving commission to have it done: as, the summoning of a defendant, taking a distress, redressing a disseisin, or the like. Or, according to Fitzherbert, a writ is a formal letter of the king in parchment, sealed with a seal, and directed to some judge, officer, or minister, &c. at the suit or plaint of a subject, requiring to have a thing done, for the cause

briefly expressed, which is to be discussed in the proper court according to law.

Writs are variously divided, and in various respects. Some, with regard to their order, or manner of granting, are termed *original*, and others *judicial*.

WRITS, *Original*, are those sent out of the high court of chancery, to summon the defendant in a personal or tenant in a real action; either before the suit begins, or to begin the suit by it.

Royal writs are held to be demandable of common right, on paying the usual fees; for any delay in the granting of them, or setting an unusual or exorbitant price upon them, would be a breach of Magna Charta, cap. 29. "Nulli vendemus, nulli negabimus, aut differemus justitiam vel rectum."

Original writs are either optional or peremptory, or, in the language of our law, they are either a *precipe*, or a *si te fecerit securum*.

WRITS, *Judicial*, are those sent by order of the court where the cause depends upon emergent occasions, after the suit begins.

WRITATIVE. A word of Pope's coining: not to be imitated.—Increase of years makes men more talkative, but less *writative*; to that degree, that I now write no letters but of plain how d'ye's. *Pope.*

To WRITE, *v. a.* pret. *writ* or *wrote*; part. pass. *written*, *writ*, or *wrote*. [writan, awritan, Saxon; *rita*, Icelandic; *writs*, a letter, Gothick.] To express by means of letters.

I'll write you down,
The which shall point you forth at every sitting,
What you must say.

Shakspeare.

The time, the place, the manner how to meet,
Were all in punctual order plainly writ.

Dryden.

To engrave; to impress.—Cain was so fully convinced that every one had a right to destroy such a criminal, that he cries out, Every one that findeth me shall slay me; so plain was it writ in the hearts of all mankind. *Locke.*—To produce as an author.

When more indulgent to the writer's case,
You are so good, to be so hard to please;
No such convulsive pangs it will require
To write—the pretty things that you admire.

Granville.

To tell by letter.

I chose to write the thing I durst not speak
To her I lov'd.

Prior.

To WRITE, *v. n.* To perform the act of writing.—I have seen her rise from her bed, take forth paper, fold it, and write upon't. *Shakspeare.*—To play the author.—There is not a more melancholy object in the learned world than a man who has written himself down. *Addison.*—To tell in books.

I past the melancholy flood,
With that grim ferryman which poets write of. *Shakspeare.*

To send letters.—He wrote for all the Jews concerning their freedom. *1 Esdr.*—To call one's self; to be entitled; to use the style of.—Those who begun to write themselves men, but thought it no shame to learn. *Fell.*—He writes himself *divina providentia*, whereas other bishops only use *divina permissione*. *Ayliffe.*—To compose; to form compositions.

Chaste, moral writing we may learn from hence,
Neglect of which no wit can recompense;
The fountain which from Helicon proceeds,
That sacred stream should never water weeds.

Waller.

WRITER, *s.* One who practises the art of writing. An author.—All three were ruined by justice and sentence, as delinquents; and all three famous writers. *Bacon.*

To WRITHE, *v. a.* [writan, Saxon.] To distort; to deform with distortion.

It cannot be this weak and writhed shrimp
Should strike such terror in his enemies.

Shakspeare.

Her

Her mouth she *writh'd*, her forehead taught to frown,
Her eyes to sparkle fires to love unknown,
Her sallow cheeks her envious mind did shew,
And ev'ry feature spoke aloud the curstness of a shrew.
Dryden.

To twist with violence.
Amid the plaited scales it took its course,
And in the spinal marrow spent its force;
The monster hiss'd aloud, and rag'd in vain,
And *writh'd* his body to and fro with pain;
He bit the dart.
Addison.

To wrest; to force by violence; to torture; to distort.—
The reason which he yieldeth, showeth the least part of
his meaning to be that whereunto his words are *writhed*.
Hooker.—To twist.

The King of heav'n
Bar'd his red arm, and launching from the sky
His *writhen* bolt, not shaking empty smoke,
Down to the deep abyss the flaming felon strook.
Dryden.

To WRITHE, *v. n.* To be convolved with agony or
torture.

Let each be broken on the rack;
Then, with what life remains, impaled, and left
To *writhe* at leisure round the bloody stake.
Addison.

To WRITHLE, *v. a.* To wrinkle; to corrugate. *Ob-
solete.*

But see! this whitenesse is obscure,
Cynthia spotted, she impure;
Her body *writhel'd*, and her eyes
Departing lights at obsequies.
Lovelace.

WRITING, *s.* A legal instrument; as, the *writings* of
an estate.—Gentlemen keep *writings* in their closets, ladies
medicines. *Seller.*—A composure; a book.—They thought
no other *writings* in the world should be studied. *Hooker.*
—Such arguments had an invincible force with those pagan
philosophers, who became Christians, as we find in most of
their *writings*. *Addison.*—A written paper of any kind.

In at his windows throw
Writings, all tending to the great opinion
That Rome holds of his name.
Shakspeare.

WRITINGMASTER, *s.* One who teaches to write.—
The facility of which I spoke consists not in bold strokes,
it makes not a great effect at a distance; that sort of free-
dom belongs rather to a *writingmaster* than a painter.
Dryden.

WRITTEN. The participle passive of *write*.
Their doctrine and their story *written* left,
They die.
Milton.

Language is a connexion of audible signs, the most apt in
nature for communication of our thoughts: *written* language
is a description of the said audible signs, by signs visible.
Holder.

WRITTLE, a village and parish of England, in the
county of Essex. It was formerly a market town. King
John had a palace here, some vestiges of which are still to be
seen; 2½ miles west of Chelmsford. Population 1830.

WRIZZLED, *adj.* Wrinkled.
Her *wrizzled* skin, as rough as maple rind,
So scabby was, that would have loath'd all womankind.
Spenser.

WROCKWARDINE, a parish of England, in Salop.

WROKEN. The part. pass. of *To wreak*.
Who lookt a little up at that his speech,
Yet would not let their battell so be broken,
Both greedie fierce on other to be *wroken*.
Spenser.

WRONG, *s.* [ppang, Saxon.] An injury; a designed
or known detriment; not right; not justice.—She resolved
to spend all her years, which her youth promised should be
many, in bewailing the *wrong*, and yet praying for the
wrongdoer. *Sidney.*—Error; not right; not truth.

Vol. XXIV. No. 1670.

Be not blindly guided by the throng,
The multitude is always in the *wrong*.
Roscommon.

Here was *wrong* on both sides; and what would follow
but confusion. *Leslie.*

WRONG, *adj.* Not morally right; not just; not agree-
able to propriety or truth; not true.—I find you are an in-
vincible Amazon, since you will overcome, though in a
wrong matter. *Sidney.*—If it be right to comply with the
wrong, then it is *wrong* to comply with the right. *Leslie.*
—Not physically right; unfit; unsuitable.

Of Glo'ster's treachery,
And of the loyal serviee of his son,
When I inform'd him, then he call'd me sot,
And told me I had turn'd the *wrong* side out. *Shakspeare.*

We never think of the main business of life, till a vain re-
pentance minds us of it at the *wrong* end. *L'Estrange.*—
Acting improperly.

Who want, while thro' black life they dream along,
Sense to be right, and passion to be *wrong*.
Young.

WRONG, *adv.* Not rightly; amiss.—If he go *wrong*,
she will give him over to his own ruin. *Ecccl.*—A thousand
odd capricious, men's minds are acted by, may make one man
quote another man's words *wrong*. *Locke.*—Ten censure
wrong, for one that writes amiss. *Pope.*

To WRONG, *v. a.* To injure; to use unjustly, either
by doing injury, or imputing evil without justice.—So wor-
thy a part of divine service we should greatly *wrong* if we
did not esteem preaching as the blessed ordinance of God.
Hooker.

WRONGDO'ER, *s.* An injurious person.—She resolved
to spend all her years in bewailing the wrong, and yet pray-
ing for the *wrongdoer*. *Sidney.*—If any seat be taken away
by a stranger, the churchwarden may have action against the
wrongdoer. *Ayliffe.*

WRONG'GER, *s.* He that injures; he that does wrong.

That cuckold lives in bliss,
Who, certain of his fate, loves not his *wronger*.
Shakspeare.

Many times a prince is driven to spend far more of his trea-
sure in punishing by war the *wrongers* of his people, than
the loss of his people did amount unto. *Raleigh.*

WRONGFUL, *adj.* Injurious; unjust.
I am so far from granting thy request.
That I despise thee for thy *wrongful* suit.
Shakspeare.

He that have wronged so in daily trade, that he knows not
in what measure he hath done it, must redeem his fault by
alms, according to the value of his *wrongful* dealing. *Bp.
Taylor.*

WRONGFULLY, *adv.* Unjustly.—Dorus, said Pamela,
you blame your fortune very *wrongfully*, since the fault is
not in fortune, but in you, that cannot frame yourself to
your fortune; and as *wrongfully* do require Mopsa to so
great a disparagement as to her father's servant. *Sidney.*

This poor fellow.
He had thought to murder *wrongfully*.
Shakspeare.

WRONGHEAD, or WRONGHEADED, *adj.* Having a
perverse understanding.

Much do I suffer, much to keep in peace
This jealous, waspish, *wronghead*, rhyming race. *Pope.*

WRONGLESSLY, *adv.* Without injury to any.—
Dearly esteemed of her for his exceeding good parts, being
honourably courteous, and *wronglessly* valiant, consider-
ately pleasant in conversation, and an excellent courtier,
without unfaithfulness. *Sidney.*

WRONGLY, *adv.* Unjustly; amiss.
What thou would'st highly
That would'st thou holily; would'st not play false,
And yet would'st *wrongly* win.
Shakspeare.

WRONGNESS, *s.* Wrong disposition.—The best have
great *wrongnesses* within themselves, which they complain
of, and endeavour to amend. *Butler.*

WRONKI, a town of Prussian Poland, on the Wartha, with 1600 inhabitants; 32 miles north-west of Posen.

WROOT, a parish of England, in Lincolnshire; 11 miles north-west of Gainsborough.

WROTE, pret. and part. of *write*. *Dr. Johnson*.—*Written* is now generally used for the participle.—No man has the estate of his soul drawn upon his face, nor the decree of his election *wrote* upon his forehead. He who would know a man thoroughly, must follow him into the closet of his heart; the inspection of which is only the prerogative of omniscience. *South*.—It is to his fables, though *wroté* in his old age, that Dryden will owe his immortality. *Dr. Warton*.

WROTH, *adj.* [from *wræð*, Saxon. See *WRATH*.] Angry.

The Lord said unto Cain, Why art thou *wroth*? *Gen.*—*Wroth* to see his kingdom fail. *Milton*.

WROTHAM, a parish of England, in Kent; 24 miles from London.

WROTLESLEY, a hamlet of England, in Staffordshire, near Wolverhampton.

WROUGHT. [ppoh̄t, Saxon. The pret. and part. pass. as it seems, of *werk*: as the Dutch *wercken*, makes *geroecht*. *Dr. Johnson*.—Our ancestors, by substituting *h* for *k* or *c*, wrote *ppoh̄t*; and by transposition *ppoh̄t*; which we now write *wrought*, and retain both as past tense and past participle of *pyncan*, to work. *H. Tooke*.]—Effected; performed.—The Jews wanted not power and ability to have convinced the world of the falsehood of these miracles, had they never been *wrought*. *Stephens*.—Influenced; prevailed on.

Had I thought the sight of my poor image
Would thus have *wrought* you, for the stone is mine,
I'd not have showed it. *Shakspeare*.

Produced; caused.

All his good prov'd ill in me,
And *wrought* but malice. *Milton*.

They *wrought* by their faithfulness the public safety.
Dryden.—Worked; laboured.—They that *wrought* in silver, and whose works are unsearchable, are gone down to the grave. *Bar.*—Moses and Eleazer took the gold, even all *wrought* jewels. *Num.*—Gained; attained.

We ventured on such dang'rous seas,
That if we *wrought* out life, 'twas ten to one. *Shakspeare*.

Operated.

Such another field
They dreaded worse than hell: so much the fear
Of thunder, and the sword of Michael,
Wrought still within them. *Milton*.

Used in labour.—Take an heifer which hath not been *wrought* with, and which hath not drawn in the yoke. *Deut.*

Worked; driven.—As infection from body to body is received many time by the body passive, yet is it by the good disposition thereof repulsed and *wrought* out, before it be formed in a disease. *Bacon*.—Actuated.

Vain Morat, by his own rashness *wrought*,
Too soon discover'd his ambitious thought;
Believ'd me his, before I spoke him fair,
And pitch'd his head into the ready snare. *Dryden*.

Manufactured.—It had been no less a breach of peace to have *wrought* any mine of his, than it is now a breach of peace, to take a town of his in Guiana, and burn it. *Raleigh*.—Formed.—He that hath *wrought* us for the same thing, is God. *Cor.*—Excited by degrees; produced by degrees.

The spirit is *wrought*,
To dare things high, set up an end my thought. *Chapman*.

Guided; managed.—A ship by skilful steersman *wrought*. *Milton*. Agitated; disturbed.

We stay upon your leisure,——

—Give me your favour: my dull brain was *wrought*
With things forgot. *Shakspeare*.

WROUGHTON, a parish of England, in Buckinghamshire; 2 miles from Fenny Stratford.—2. A parish in Wiltshire; 3 miles south-west of Swindon. Population 1202.

WROXALL, a parish of England, in Warwickshire; 6 miles north-west of Warwick.

WROXETER, a town and parish of England, in the county of Salop, situated on the river Severn; 5 miles south-east of Shrewsbury. It was known to the Romans. Traces of a wall, and also of a bridge over the river, are yet discernible when the water is low.

WROXHAM, a parish of England, in Norfolk; 2½ miles south-east of Coltishall.

WROXTON, a parish of England, in Oxfordshire.
WRUNG. The pret. and part. passive of *wring*.—He first cald to me: then my hand he *wrung*. *Chapman*.—No mortal was ever so much at ease, but his shoe *wrung* him somewhere. *L'Estrange*.

WRY, *adj.* Crooked; deviating from the right direction.

Sometimes to her news of myself to tell
I go about, but then is all my best
Wry words, and stamm'ring, or else doltish dumb;
Say then, can this but of enchantment come? *Sidney*.

Distorted.—It is but a kick with thy heels, and a *wry* mouth, and Sir Roger will be with thee. *Arbuthnot*.—*Wring*; perverted; wrested.—He mangles and puts a *wry* sense upon protestant writers. *Atterbury*.

To *WRY*, *v. n.* To be contorted and writhed; to deviate from the right direction.—These *wry* too much on the right hand, ascribing to the holy scripture such kind of perfection as it cannot have. *Sandys*.

To *WRY*, *v. a.* To make to deviate; to distort.—They have wrested and *wry'd* his doctrine. *Robinson*.—To what pass are our minds brought, that from the right line of virtue are *wryed* to these crooked shifts? *Sidney*.

WRY'NECK, *s.* [*torquilla*, Lat.] A bird.

WRYNEHILL, a township of England, in Cheshire.
WRYNESS, *s.* State of being *wry*; deviation from the right way.—Exploring the rectitude or *wryness* of their behaviours. *W. Montague*.

WSETIN, a town of Moravia; 23 miles north-east of Hradisch.

WUDWAN, a fortified town of Hindostan, province of Gujerat. It is of considerable extent and population, and carries on an extensive trade with the gulf of Cambay. Lat. 22. 42. N. long. 71. 47. E.

WULDAU, a small town in the interior of Bohemia; 14 miles south-west of Crumau.

WULFENIA [so named by Jacquin, from the Rev. Francis Xavier Wulfen, author of *Plantæ Rariores Carinthiæ*, in Jacquin's *Miscellanea*], in Botany, a genus of the class diandria, order monogynia.—Generic Character. Calyx: perianth one-leafed, five-parted; leaflets linear, subulate, equal, erect, permanent. Corolla: one-petalled, ringent; tube subglobular-gibbous at the base: border two-lipped; upper lip shorter, entire, somewhat arched, acute; lower longer, bent down, trifid; bearded at the aperture. Stamina: filaments two, filiform, converging, arch-wise, concealed under the upper lip, shorter than the corolla. Anthers roundish. Pistil: germ oblong, compressed. Style filiform, very long. Stigma: capitate, umbilicate. Pericarp: capsule oval, obtuse, compressed at the top, grooved on each side, two-celled, four-valved. Seeds numerous, round.—*Essential Character*. Corolla: tubular, ringent, with the upper lip short, entire, the lower three-parted, with the aperture bearded. Calyx five-parted. Capsule: two-celled, four-valved.

Wulfenia Carinthiaca.—This is a stemless plant, nearly allied to the *Pæderotas*. Root perennial. Leaves radical, obovate, obtuse, grossly crenate, smooth. Scape round, somewhat hairy, much higher than the leaves. Flowers peduncled, supported by a lanceolate bracte, all directed the same way, blue.

blue.—Native of Carinthia, on the highest Alps, in a very fat soil.

WULFERSDORF, a town of Lower Austria, on the river Zava; 25 miles north-by-east of Vienna.

WULFERSHAUSEN, a village of Franconia, on the Saale, with 800 inhabitants.

WULFRATH, an inland town of Prussian Westphalia; 11 miles east-by-north of Dusseldorf. Population, with its parish, 4800.

WULLERSDORF, a town and parish of Germany, in Lower Austria; 32 miles south-by-west of Vienna, with 1700 inhabitants.

WUMME, a river of Germany, in Hanover, which joins the Weser, in the territory of Bremen.

WUNNENBERG, a town of Prussian Westphalia; 14 miles south of Paderborn. Population 1000.

WUNSCHELBURG, a town of Silesia, in the county of Glatz; 14 miles west-north-west of Glatz. Population 1400.

WUNSDORF, a town of Germany; 14 miles west-north-west of Hanover. Population 1700.

WUNSIEDEL, a town of Bavarian Franconia, on the Rossiau; 15 miles west-by-south of Eger. It has some manufactures of woollen stuffs; and there are in the environs several mines and iron-works. Population 2600.

WUPPER, a river of Prussian Westphalia, which flows through the duchy of Berg, and falls into the Rhine.

WÜRBEHAL, a small town of Silesia; 15 miles west of Jagerdorf. Population 1100.

WURDA, a river of Hindostan, province of Berar. It rises in the Injardy hills, and after a course of 200 miles, falls into the Godavery.

WURGAUM, a town of Hindostan, province of Gujerat, district of Chalawara. Lat. 23. 20. N. long. 71. 52. E.

WURGSDORF, a large village of Prussian Silesia, with 1400 inhabitants.

WURM, a small town of Prussian Westphalia, in the duchy of Juliers; 10 miles west-north-west of Juliers. Population 1400.

WURM, the name of three rivers in Germany; one in Bavaria, which flows out of the lake of Wurm, and falls into the Ammer near Dachau; another in Suabia, which joins the Neckar; and a third in the Prussian states, which falls into the Roer.

WURMBEA [so named by Thunberg, in honour of *Fredrick Baron van Wurmb*, secretary to the Batavian society], in Botany, a genus of the class hexandria, order trygynia, natural order of coronariae, juncti (*Juss.*)—Generic Character. Calyx: perianth one-leaved, tubular, six-cornered, half-six-cleft; segments lanceolate, acute, erect or spreading. Corolla none. Stamina: filaments six, filiform, erect. Anthers roundish. Pistil: germ three-sided, grooved, smooth, superior. Styles three, three-sided, awl-shaped, length of the stamens. Stigmas obtuse. Pericarp: capsule oblong, three-sided, three-grooved, three-celled, three-parted from the middle. Seeds numerous, round.—*Essential Character*. Calyx none. Corolla: six-parted, with a hexangular tube. Filaments inserted into the throat.

1. *Wurmbea pumila*.—Spike three or four-flowered, tube length of the border. Plant an inch high.

2. *Wurmbea campanulata*.—Spike many-flowered, length of the leaves; tube length of the border, bell-shaped. A finger's length or more. Leaves as in all species, three lanceolate, cowed, ventricose at the base, but narrower than in the following species, and the same with the spike, which is beset with numerous flowers.

3. *Wurmbea longiflora*.—Spike many-flowered, longer than the leaves, tube twice as long as the border. Leaves much wider than in the preceding species. Spike more flexuose at the base, with numerous flowers more distant. Tube of the corolla long and narrow.—All Natives of the Cape of Good Hope, near Groene Kloof, and elsewhere.

WURMBERG, a small town of Germany, in Wirtemberg.

WURMSEE, a lake of Germany, in Bavaria; 15 miles

south-west of Munich. It is 12 miles in length, and 4 in its greatest breadth.

WURMSINGEN, a town of Germany, in Baden. Population 1000.

WURZACH, a small town in the west of Germany, in Wirtemberg, on the river Aitrach; 33 miles south of Ulm. Population 1000.

WURZBACH, a village of Germany, near Ebersdorf. Population 800.

WURZBURG, a village of Germany, in Hesse-Darmstadt; 3 miles east of Erbach.

WURZBURG, a city of Franconia, the capital formerly of a bishopric and grand duchy, now of the Bavarian circle of the Lower Maine, situated on the Maine. Nothing can be more pleasant than the environs of this city. It stands in a hollow, with the valley of the Maine extending in two directions, and another valley to the north. A tract of several thousand acres around the town is covered with vineyards. The Maine is here a large and noble stream, presenting with its boats and barges, an animated picture. This river divides the town into two parts, of which the larger is on the right bank; they are joined by an elegant bridge. On the left bank is a hill, with a castle, formerly the episcopal residence, now a citadel. The town itself is still surrounded with a mound and moat; but, fortunately for the inhabitants, is so commanded by heights, that an attempt to stand a siege would be wholly inadvisable.

The building called the palace belonged formerly to the bishop, afterwards to the archduke. It is of an oblong form, on the plan of the palace at Versailles, and of great extent. Next ranks the hospital, a large and regular structure. The university has given rise to some trade in books; but it is feeble, compared to that of Leipsic, or even of Frankfurt. Wurzburg, formerly a bishopric of the German empire, was secularised in 1802, and given to the archduke Ferdinand of Austria. In 1815 it was ceded to Bavaria. This district is in Franconia, in the vicinity of Aschaffenburg, in one of the most fertile and beautiful tracts of Germany; 130 miles north-north-west of Munich, and 75 north-north-east of Stuttgart. Lat. 49. 46. N. long. 9. 55. E.

WURZEN, a town of Saxony, on the Mulda; 14 miles east of Leipsic. Lat. 51. 22. N. long. 12. 42. E. Population 2400.

WUSTERHAUSEN, a town of Prussia, on the Suhne; 18 miles south-south-east of Berlin. Population 2100.

WUSTERHAUSEN, a town of Prussia; 44 miles north-west of Berlin. Population 2100.

WYACONDA, a river of the United States, in Louisiana, which runs into the Mississippi; 34 miles below the Moines. It is 100 yards wide at its mouth. Lat. 39. 46. N. long. 91. 48. W.

WYALUSING, a post township of the United States, in Luzerne county, Pennsylvania, on the Susquehanna, at Wyalusing Falls. Population 576.

WYANDOTS, Indians in the United States, in Ohio, on the Upper and Lower Sandusky. Number 1000.

WYASTON, a hamlet of England, in Derbyshire; 3 miles south of Ashborne.

WYBASTON, a hamlet of England, in the parish of Bushbury, Staffordshire.

WYBERTON, a parish of England, in Lincolnshire, near Boston. Population 353.

WYBORG, an extensive district of European Russia, lying to the north of the gulf of Finland, between Finland and the lake of Onega. Its area is computed at 16,000 square miles (the half of Scotland), but the population is small, being returned at 186,000, chiefly Finns. Hunting and fishing are their chief employments.—2. A fortified town of European Russia, in the government of Finland. It stands in a valley on the gulf of Finland, and consists of several parts, the town, the castle, and the suburbs, but the whole population is only 3500. Its trade is considerable: about 120 vessels arrive annually at the harbour; 98 miles north-west of Petersburg. Lat. 60. 42. 40. N. long. 28. 46. 5. E.—3. An ancient town of Denmark, in North Jutland, situated

situated on a small lake, nearly in the centre of Jutland. It is tolerably built, having been in some degree reconstructed, after a great fire in 1726. It has few manufactures; 120 miles north of Sleswick. Population 2400.

WYBUNBURY, or WIBBUNBURY, a parish of England, in Cheshire, near Nantwich.

WYCHERLY (William), was born at Cleve, in Shropshire, about the year 1640; and in France, whither he went for his education, he conformed to the Roman Catholic religion. Upon his return to England, a little while before the Restoration, he entered, without matriculation, as a gentleman-commoner at Queen's college, Oxford, and leaving it without a degree, took chambers in the Middle Temple. However, he abandoned the law, and addicted himself to the composition of comedies, the first of which was entitled "Love in a Wood, or St. James's Park," which brought him into notice in 1672; so that he became a favourite of the duchess of Cleveland, and of Villiers, the duke of Buckingham. He was also honoured by the attention of the king, and by promises of future promotion. His majesty, however, was displeased by his marriage with the countess of Drogheda, and the connection was unhappy. On occasion of her death, however, she settled her whole estate upon him, and his title being disputed, he was involved in law expenses and other incumbrances, which occasioned his being committed to prison. Having remained in prison for seven years, he was liberated by king James II., who, delighted by seeing his comedy of the "Plain Dealer," gave orders for the payment of his debts, and settled upon him a pension of 200*l.* a year.

His circumstances were still embarrassed, and though by his father's death he became a tenant of the estate to which he succeeded, he was not emancipated from his difficulties. Some time after he married a young woman, on whom he settled a jointure of 1500*l.*, humourously stipulating with her that she should not take an old man for her second husband, which condition, it is said, she promised faithfully to observe. He died in 1715, at the age of 75.

Besides the two comedies already mentioned, he composed "The Gentleman Dancing-Master," and "The Country-Wife." The last and the Plain Dealer are the most noted. His plays, though commended by lord Rochester, are strongly marked with his own character,—“some wit and strength of delineation, with much coarseness and licentiousness.” He attacks vice, it is said, with the severity of a cynic, and the language of a libertine. A volume of poems published in 1704 was so unsuccessful, that he applied to Pope, who was a mere youth, to correct the versification: Dr. Johnson remarks, that “when Pope was sufficiently bold in his criticisms, and liberal in his alterations, the old scribbler was angry to see his pages defaced, and felt more pain from the detection than content from the amendment of his faults.” The posthumous works of Wycherly, in prose and verse, were published by Theobald in 1728, 8vo., but they are utterly forgotten.—*Biog. Brit. Johnson's Life of Pope. Gen. Biog.*

WYCK, a small town of the Netherlands, on the Maese, opposite to Maestricht, to which it is joined by a bridge, and of which it is generally accounted a suburb.

WYCK, a town of Denmark, in the island of Fohr, belonging to Sleswick. Population 700.

WYCLIFFE, a township of England, North Riding of Yorkshire; 2 miles north-east of Greta Bridge.

WYCOMBE, CHIPPING or HIGH, a borough and market town of England, in Buckinghamshire, situated on the banks of a small rivulet which falls into the Thames two miles below Marlow. It consists of several streets branching from the High-street, which is spacious and well built. The town-hall was erected at the expense of John, earl of Shelburne, in 1757. It is a large brick building, supported on 34 stone pillars, and finished in a neat and convenient manner. The church is a handsome structure of stone, built in the year 1273, and has a tower at the west end, 108 feet high, adorned with roses and portcullises: it was erected in 1529; but its pinnacles and other ornaments were built by the above earl, about 1755. The interior is divided into a

nave, aisles, and chancel. Over the communion-table is a large painting by Mortimer, presented to the church by Dr. Bates of Little Missenden. It represents St. Paul converting the Druids to christianity, and contains fifteen figures, with a little babe, and a dog, grouped with considerable skill. The organ was erected by Green in 1783, the expense being defrayed by subscription. In the chancel is a magnificent mural monument by Scheemakers, erected to the memory of Henry Petty, earl of Shelburne, at the charge of 2000*l.*, bequeathed by him for that purpose. The effigy of the earl is lying on a cist of black marble, with a figure of Religion holding a book before him. On the right-hand are Virtue and Learning, represented by female figures instructing a child; on the left, Charity and a Roman warrior. The canopy is sustained by pillars of grey marble; at the top is an urn, with Prudence and Justice on the sides. Beneath the cist is a medallion of the great Sir William Petty, the earl's father, and over it the family arms. In the south aisle is a beautiful monument, by Carlini, to the memory of Sophia, first wife to William, marquis of Lansdowne, who died in 1771: the figures represent that lady reclining on an urn, with her two children.

This borough was incorporated some time prior to the reign of Edward III.; and a memorandum in the old corporation books mentions the first charter to have been granted by Henry III. The existing charters bear date the 28th of Elizabeth, the 5th of James, and the 15th of Charles II. The corporation consists of a mayor, recorder, twelve aldermen, and various inferior officers. The dignity of high steward was annulled by the charter of king Charles, but has occasionally been conferred since that period. The right of election for the borough is vested in the mayor, aldermen, bailiffs, and burgesses: the latter are chosen at the discretion of the mayor, aldermen, and bailiffs. The number at present is about 80, 60 of whom are compelled to be resident, by a bye-law made in 1794. The first return to parliament was in the 28th of Edward I., since which time it has been represented without intermission. The prosperity of the town is, in a great measure, owing to the proximity of the Wycombe stream, which, in its course through the parish, gives motion to 15 corn and paper mills. The manufacture of the latter article is probably carried on to as great an extent in this neighbourhood as in any part of England. The second source of its wealth is the expenditure of travellers, which, from this being the principal thoroughfare to Oxford, &c. amounts to a very considerable sum annually. Some of the inhabitants are supported by lace-making. The antiquities found in its neighbourhood, particularly a tessellated pavement, and various Roman coins, have induced a supposition that it was a Roman settlement; 31 miles south-south-east from Buckingham, and 29 west-by-north from London. Population 2490; houses 494.

WYCOMBE, WEST, a village and parish of England, in Buckinghamshire. The village is seated under a steep eminence, partly covered with wood, whence the mausoleum, and the small tower of its beautiful but singular church, seem to emerge. The latter structure was rebuilt in the year 1763, by lord le Despencer; but the tower and chancel are parts of the ancient pile. The interior is extremely neat, as well as peculiar. The ceiling and communion-table are elegantly painted in Mosaic. The chancel is paved with marble, and embellished with a delineation of the Last Supper, depicted on the ceiling. The altar is of carved oak. The windows are glazed with stained glass, and are ornamented with small scriptural pieces; 2½ miles north-west-by-west from High Wycombe. Population 1362.

WYCOMING FALLS, on the Susquehanna, 2 miles above Wilkesbarre, in the United States.

WYE, a parish and town of England, in the county of Kent, situated near the river Stour, over which it has a bridge. The market has been long disused; but it has two annual fairs, in May and November; 10 miles south-south-west of Canterbury. Population 1322.

WYE, a river of South Wales, which issuing out of Plynlimon-Hill, in Cardiganshire, very near the source of the Severn,

Severn, crosses the north-west corner of Radnorshire, giving name to the town of Ryadergowy, or the Fall of the Wye, where it is precipitated in a cataract. Then flowing between this county and Brecknockshire, it crosses Herefordshire, and dividing the counties of Gloucester and Monmouth, falls into the Severn below Chepstow. This river is navigable almost to the Hay; and it communicates by a canal with the Severn, from Hereford to Gloucester.

WYE, a river of England, in Derbyshire, which falls into the Derwent, below Bakewell.

WYE MILLS, a post village of the United States, in Talbot county, Maryland.

WYERSDALE, NETHER, a hamlet of England, in Lancashire, near Garstang.

WYERSDALE, OVER, a township in the above county; 6 miles north-north-east of Garstang.

WYERSTONE, or WYVERSTONE, a parish of England, in Suffolk.

WYFIELD, or WIFEHOLD, a hamlet of England, in Berkshire.

WYFORDBY, or WYVERBY, a parish of England, in Leicestershire.

WYHAM, a parish of England, in Lincolnshire; 6½ miles north-north-west of Louth.

WYHRA, LOWER, a village of Saxony, in the principality of Altenburg.

WYK BY DUURSTED, a decayed town of the Netherlands, in the province of Utrecht; 21 miles west of Arnheim. Population 2000.

WYK AM ZEE, a village of North Holland; 9 miles north of Haarlem. Population 800.

WYKE, a village of the Netherlands; 10 miles north of Deventer. Population 900.

WYKE, two hamlets of England, in Dorsetshire and Gloucestershire.

WYKE REGIS, a village and parish of England, in Dorsetshire, near Weymouth. Its church is an extensive building, serving for a land-mark.

WYKEHAM, or WYCOMBE, a township of England, in Leicestershire.

WYKEHAM, a parish of England, North Riding of Yorkshire; 6½ miles south-west of Scarborough. Population 511.

WYKEHAM, EAST, a parish of England, in Lincolnshire; 7 miles north-west of Louth.

WYKEN, a parish of England, in Warwickshire; 3 miles north-east of Coventry.

WYKENS, or WYKE-DYVE, a parish of England, in Northamptonshire.

WYKIN, a hamlet of England, in Leicestershire; 1½ miles west-north-west of Hinckley.

WYLAM, a township of England, in Northumberland; 9 miles west of Newcastle-upon-Tyne. Population 795.

WYLLIESBURG, a post township of the United States, in Charlotte county, Virginia.

WYMERING, a parish of England, in Southamptonshire. Population 740.

WYMINGTON, or WIMMINGTON, a parish of England, in Bedfordshire; 12½ miles north-west of Bedford.

WYMOA BAY, a bay on the south coast of Atooi, one of the Sandwich islands. Lat. 21. 57. N. long. 200. 20. E.

WYMONDHAM, or WINDHAM, a market town of England, in the county of Norfolk, pleasantly situated on the great road to London. This place has been supposed to be of Roman origin; but the name is purely Saxon; and the importance of the town arose from the erection of a monastery here, in the time of Henry I., A. D. 1130, by William de Albin, who endowed it amply with lands. The abbey church was a large, handsome, cruciform building, erected soon after the year 1130, and dedicated to the Virgin Mary and Thomas a Becket. The structure consisted of a choir, nave, transept, north and south aisles, with a tower standing in the centre, still called the abbey steeple, and another at the west end. When the monastery was destroyed, the south aisle, over which were lodgings for supernumerary

monks, was demolished. The present church consists of a nave with aisles, a large western tower, and another at the intersection of the nave with the transepts. The ancient parts of the building display semicircular arches, with short columns, large piers, &c. which appear to be parts of the original structure. At the east end, and on the south side of the church, are some fragments of walls. The north aisle, porch, and towers, are of a much later style than the nave and south aisle. Altogether the church is an interesting and curious pile; presenting to the architectural antiquary and draughtsman much to admire and delineate. Here is a large font, ornamented with bold sculpture, and elevated on steps. The town contains several liberties, which are called the insoken divisions; and the parish, which is very extensive, comprehends several hamlets, denominated the outsoken division. Wymondham is principally inhabited by manufacturers, who are employed in various branches of weaving; in making spindles, tops, and other articles of wooden ware. This place gave name to the distinguished family of Wyndham, or Windham. Wymondham was the birth-place of William Kett, who headed a rebellion during the reign of Edward VI.; but was finally defeated by the earl of Warwick, and hanged on the church steeple here, in 1549. Market on Friday, with three annual fairs; 9 miles south-west of Norwich, and 100 north-east-by-north of London. Population 4023.

WYMONDHAM, a parish of England, in Leicestershire.

WYMONDLEY, GREAT and LITTLE, two parishes of England, in Hertfordshire, near Hitchin.

WYNAAD, a district of Hindostan, province of Malabar, situated between the 11th and 12th degrees of northern latitude, and comprehending an area of 1250 square miles; but is mountainous, and overrun with wood. It is governed by a Nair chieftain, now tributary to the British. Its capital is Penamburt Cotta, called also Wynaad, which is situated in lat. 11. 47. N. long. 76. 10. E.

WYNANT'S KILL, a river of the United States, in New York, which joins the Hudson, in Troy; 2 miles south of Poesten's Kill.

WYNFELDEN, or WEINFELDEN, a small town of the Swiss canton of Thurgau, on the Thur; 7 miles south-south-west of Constance.

WYNSTER, a river of England, in Lancashire, which falls into the Kenn.

WYOMING, a general name formerly given to a tract of country in Pennsylvania, situated on the Susquehanna, with a fort, 2 miles above Wilkisarre. In the year 1778 this fort was attacked by a party of British and Indians. The garrison were soon overpowered, and fell a prey to Indian barbarity; after a bloody military execution of a great part, the rest were shut up in the barracks, to which they set fire, and consumed the whole.

WYRA GHUR, a town of Hindostan, province of Gundwanah, tributary to the rajah of Nagpore. Lat. 20. 31. N. long. 80. 56. E.

WYRARDISBURY, or WRAYSURY, a parish of England, in Buckinghamshire. Population 560.

WYRE, PIDDLE, a hamlet of England, in Worcestershire, near Pershore.

WYRLEY, GREAT and LITTLE, two hamlets of England, in Staffordshire, the former 5 miles north-west of Walsall, the latter 6 west-south-west of Lichfield.

WYSALL, or WISHOU, a parish of England, in Nottinghamshire; 8 miles south-by-east of Nottingham.

WYSAUKEN CREEK, a river of the United States, in Pennsylvania, which runs into the east branch of the Susquehanna; 6 or 8 miles above Asylum.

WYSLYTEN, a town of Poland; 20 miles east-south-east of Gumbinnen. Population 1600.

WYSOKIE, a small town of European Russia, in Volhynia; 15 miles west of Kaminiac.

WYSOKIE-MACIECKI, a town of Poland; 83 miles east-north-east of Warsaw. Population 900.

WYSOX, a post township of the United States, in Luzerne county, Pennsylvania. Population 619.

WYSZAINEN, a town of Poland; 18 miles north of Suwalki. Population 1000.

WYSZOGROD, a town of Poland, on the Vistula; 32 miles west-by-north of Warsaw. Population 2000.

WYTHAM, or WIGHTHAM, a parish of England, in Berkshire; 8½ miles north-by-west of Abingdon.

WYTHAM ON THE HILL, a hamlet of England, in Lincolnshire.

WYTHAM, NORTH and SOUTH, two parishes of England, in Lincolnshire.

WYTHE, a county of the United States, in the south-west part of Virginia, bounded north-north-west by Tazewell county, north-east by Montgomery, south-south-east by Grayson county, and west by Washington county. Population 8356. Slaves, 1157. Chief town, Evansham.

WYTHEBURN, a township of England, in Cumberland, 8 miles south-east of Keswick.

WYTHOP, a township of England, in Cumberland; 5 miles east-by-south of Cockermouth.

WYTON, a township of England, in Yorkshire; 5 miles from Kingston-upon-Hull.

WYTOOTACKEE, an island in the South Pacific ocean, about 10 miles in circumference; discovered by captain Bligh in 1789. Lat. 18. 52. S. long. 200. 19. E.

WYVERSTONE, a parish of England, in Suffolk; 6 miles north of Market Stow.

WYVILL, a parish of England, in Lincolnshire; 4 miles north-west of Colsterworth.

X A L

X Is a letter, which, though found in Saxon words, begins no word in the English language. *Dr. Johnson.*

X. The numeral letter for ten.

XACAPIXTLA, a head settlement of Mexico, in the district of Cuernavaca, containing 338 Spanish, and 50 Indian families.

XACONA, a settlement of Mexico, in Valladolid. Population 214, Spaniards, mulattoes, and Indians.

XADRAQUE, or JADRAQUE, a small but well built town of the interior of Spain, in the province of Guadalaxara; 60 miles east-north-east of Madrid, and 16 west-south-west of Sigüenza.

XAGUA BAY, a large bay on the south coast of the island of Cuba. This is one of the best ports in the West Indies, and is 15 miles in circumference, surrounded with mountains which break off the force of the winds. Lat. 22. 10. N. long. 18. 20. W.

XAINTES SANTOS, or ALL SAINTS' ISLANDS, as having been discovered on that holiday, by the Spaniards; three small islands of the West Indies, situated to the south-east of Guadaloupe. The most westerly of them is called Terra de Bas, or the Low Island, and the most easterly, Terra de Haut, or the High Island. The third, which lies exactly in the middle between the other two, seems to be nothing more than a large barren rock, but is of use in assisting to form a very good harbour. The island of Terra de Bas is about nine miles in circumference, but the other is larger. These islands have constantly a fresh breeze, let the wind blow from what quarter it may; and on the Terra de Bas is a neat wooden church. It has also two very convenient creeks, both for anchorage and landing. They are about six miles distant from Guadaloupe, and 15 from Mariegalante. Lat. 15. 56. N. long. 61. 32. W.

XALAMA, a lofty mountain of the west of Spain, in the province of Leon.

XALAPA, a settlement of Mexico, in the intendency of Oaxaca, containing 1000 families of Indians.

XALAPA, a considerable town of Mexico, formerly famous for the fair held on the arrival of the stated fleets from Europe; and ever since the commerce was declared free, it remains a considerable mart for European commodities. It stands on the southern skirts of a mountain, in a beautiful climate, the soil being clayey, and in parts stony, while pure waters issue from a white sand, and fertilize the country. From the convent of St. Francis there is a magnificent view of the colossal summit of the Coffre and the Pic d'Orizaba, of the declivity of the Cordillera, of the river of L'Antigua, and even of the ocean. The sky of Xalapa, beautiful and serene in summer, from the month of December to the month of February wears a most melancholy aspect. Whenever the north wind blows at Vera Cruz, the inhabitants of Xalapa are enveloped in a thick fog. The thermometer then descends to 63° and 66° of Fahrenheit, and during this period, the sun and stars are frequently invisible for two or three

X.

X A N

weeks together. The richest merchants of Vera Cruz have country houses at Xalapa, in which they enjoy a cool and agreeable retreat; while the coast is almost uninhabitable, from the mosquitos, the great heats, and the yellow fever. In this small town there is an excellent school for drawing, founded within these few years, in which the children of poor artisans are instructed at the expense of people in better circumstances. From the eastern coast, as has been explained more at length under the article Mexico, the land rises towards the interior by a gentle ascent, until it reaches an elevation of about 8000 feet, when it spreads out into extensive plains, known by the name of table-land. Xalapa is situated about half way up this ascent, being 4264 feet above the level of the sea. It is estimated to contain 13,000 inhabitants, and is about 50 miles north-west of Vera Cruz, and 80 east of Mexico.

XALATLACO, SANTA MARIA DE, a settlement of Mexico, in the intendency of Oaxaca, containing 380 Indian families, and 40 of Spaniards.

XALCOMULCO, a settlement of Mexico, in the district of Xalapa, containing 162 Indian families.

XALISCO, an insignificant settlement of Mexico, containing 90 Indian families.

XALON, a considerable river in the north of Spain, in the province of Arragon. It falls into the Ebro, above Saragossa.

XALPANTEPEC, a settlement of Mexico, in the district of Guauhinango, containing 132 Indian families.

XALTENGO, a settlement of Mexico, in the intendency of Mexico, containing 180 families of Indians.

XALTEPEC, a settlement of Mexico, in the intendency of Oaxaca, containing 112 Indian families.

XALTOCAN, a settlement of Mexico, in the intendency of Mexico, containing 277 Indian families.

XAMILTEPEC, a settlement of Mexico, in the intendency of Mexico, containing 120 Indian families.

XAMILTEPEC, a settlement of Mexico, in the intendency of Oaxaca, containing 700 Indian families.

XAMUNDI, a river of South America, in the New Kingdom of Granada, and province of Antioquia, which enters the Cauca.

XAN, a small river of the principality of Georgia, which falls into the Kur; 6 miles east of Gori.

XANGA, one of the Querimba islands, in the Indian sea, near the coast of Africa. Lat. 10. 45. S.

XANILA, a small village of Fezzan, on the caravan route to Egypt; 140 miles east-north-east of Mourzouk.

XANTEN, a small town of the Prussian states, near the Rhine; 12 miles south-east of Cleves. Population 2000.

XANTHE [so named from the yellow juice which it contains], in Botany, a genus of the dioecia, order syngenesia.—Generic Character. Male.—Calyx: perianth one-leaved, five or six parted: segments small, imbricate, roundish, concave, acute: at the base two small opposite scales. Corolla: petals five

five or six, roundish, bigger than the calyx, spreading. Stamina: filament one, columnar, erect. Anthers five or six, two-lobed, connate in a scutiform head, petate, concave in the centre, full of glue, they open beneath. Female.—Calyx as in the male, permanent. Corolla as in the male. Stamina: filament none. Anthers five, prismatic, erect, barren. Pistil: germ roundish, five or six-streaked, superior. Style none. Stigmas five or six, roundish, thick, emarginate, placed on the germ. Pericarp: capsule globular, small, five or six-grooved, five or six-celled, five or six-valved, opening at the grooves: partitions membranaceous, adhering to the receptacle of the seeds. Seeds very many, oblong, involved in pulp, fastened in single rows to a columnar five or six-angled receptacle.—*Essential Character.* Flowers dioecious. Calyx five-six-parted, permanent. Corolla five-six-petalled. Males with one filament, bearing five anthers, collected into a shield-shaped head. Females with five barren anthers. Capsule globose, crowned with the stigma, five-striated, five-valved. Seeds very many, involved in the pulp.

1. *Xanthe Quapoya*.—A shrub with cylindrical, knotty, spreading, pendent branches, leaves entire, sessile, fleshy, smooth, oval, pointed, opposite, and disposed crossways, flowers yellow, produced in small heaps from the tips of the branches.—Native of Guiana, flowering in November. Native name Quapoy.

2. *Xanthe Panari*.—This differs from the former in having less fleshy and smaller leaves, and flowers more closely disposed on the common footstalk: the fruit also is larger and more oblong.—Native name Pana-Panari.

XANTHIUM [from *ξανθος*, yellow. A decoction of it being of a yellow colour], in Botany, a genus of the class monoecia, order pentandria, natural order of compositæ nucamentaceæ, corymbifera (Juss.)—*Generic Character.* Male flowers compound.—Calyx: perianth common of many florets, many leaves, imbricate with slender scales, length of the florets, equal. Corolla: compound uniform, tubular. Stamina: filaments five in a tubular cylinder. Anthers erect, parallel, distinct. Receptacle: common, scarcely any, separating the florets by chaffs. Female flowers below the males, on the same plant, doubled.—Calyx: involucre two-flowered, two-leaved: leaflets opposite, three-lobed, (lobes acute, the middle one more produced,) fenced by hooked prickles, covering on every side and fastened to the germ: the little segments loose. Corolla none. Pistil: germ oval, hispid. Styles two equal, capillary. Stigmas simple. Pericarp: drupe dry, ovate-oblong, covered all over with hooked prickles, bifid at the top. Seed: nut two-celled.—*Essential Character.* Male. Calyx common imbricate. Corolla one-petalled, five-cleft, funnel-form. Receptacle chaffy. Female. Calyx involucre two-leaved, two-flowered. Corolla none. Drupe dry, muricated, two-cleft. Nucleus two-celled.

1. *Xanthium strumarium*, or small burdock.—Stem unarmed, leaves cordate, three-nerved at the base.—Stalk round, with many black spots, rising in good ground two feet high, and sending out a few side branches. Flowers in loose spikes, herbaceous, collected into roundish heads. Native of Europe, of Africa about Algiers, of China and Cochinchina, in fields and hedges common.

2. *Xanthium orientale*.—Stem unarmed, leaves cruciform-ovate subtrilobate.—The stalks of this are much thicker, and rise higher than those of the first.—Native of China, Japan, Ceylon, and Siberia.

3. *Xanthium echinatum*.—Stem unarmed, fruit oval prickly, prickles hooked, clustered, echinate at the base.—Stalk a foot and half high: rough with closely pressed bristles: branches very short, alternate.—Native of North America.

4. *Xanthium spinosum*.—Spines ternate, leaves three-lobed.—The stalks of this rise near three feet high, and send out many branches the whole length.—Native of Portugal and the South of France.

5. *Xanthium fruticosum*.—Leaves pinnatifid, segments gashed, stem shrubby.—Stem the height of a man, perennial

but scarcely woody, erect, roundish, obscure, somewhat hairy: branches axillary or lateral, short.—Native of Peru.

Propagation and Culture.—All these plants, except the last, are annual. The first will come up from the seeds which fall in autumn, and requires no other care but to thin the plants, and keep them clear from weeds. The second sort will do the same when the autumn is favourable: but it often happens with us that the seeds do not ripen.

The fourth sort will also in some years perfect seeds on self-sown plants, but as they sometimes fail, the sure way is to raise the plants on a gentle hot-bed, and to plant them out on a warm border in a thin soil: for when they are planted in rich ground, they will not produce flowers till late in autumn, and the seeds will not ripen.

For the culture of the fifth sort, see *Ambrosia arborescens*.

XANTHORHIZA [from the Gr. *ξανθος*, yellow, and *ρίζα*, a root], in Botany, a genus of the class pentandria, order polygynia, natural order of ranunculaceæ (Juss.)—*Generic Character.* Calyx none, unless the corolla be so called. Corolla: petals five, ovate, acute, spreading. Nectaries five, truncate-two-lobed, spreading, inserted into the receptacle, alternate with the petals and shorter than them. Stamina: filaments five to ten, awl-shaped, very short. Anthers roundish. Pistil: germs several (seven to eleven) oblong. Styles awl-shaped, curved inwards. Stigmas acute. Pericarp: capsules as many, inflated, ovate-oblong, compressed, bluntish, obliquely acuminate with the style, one-celled, bivalved, opening at the top. Seeds solitary, oblong, compressed, small.—*Essential Character.* Calyx none. Petals five. Nectaries five, pedicelled. Capsule five, one-seeded.

Xanthorhiza apiifolia.—This is a low shrub, about three feet in height. The root is woody, branched, yellow without, saffron-coloured within, and puts forth runners. Stems from the root numerous, almost simple, erect. Branches alternate, round, marked with rings, ash-coloured, with the inner bark yellow. Leaves alternate, unequally pinnate, five or six inches long including the petiole.—Native of North America.

XANTHOXYLUM [from *ξανθος*, yellow, and *ξύλον*, wood], in Botany, a genus of the class dioecia pentandria, natural order of hederaceæ, terebintaceæ (Juss.)—*Generic Character.* Male.—Calyx: perianth five-parted; leaflets oval, erect, coloured. Corolla none. Stamina: filaments commonly five, awl-shaped, erect, longer than the calyx. Anthers twin, roundish, grooved. Female.—Calyx as in the male. Corolla none. Pistil: germs two to five, roundish, ending in styles which are solitary, awl-shaped, longer than the calyx. Stigma obtuse. Pericarp: Capsules two to five, pedicelled, one-celled, two-valved, opening inwards. Seeds solitary, roundish, smooth, hanging by a thread.—*Essential Character.* Calyx five-parted. Corolla none.—Female. Pistil five. Capsule five, one-seeded.

Xanthoxylum clava Herculis, or tooth-ach tree.—This rises to the height of fifteen or sixteen feet. Stem woody, about a foot thick, covered with a whitish rough bark, and armed with short thick spines, growing to a large size as the trunk increases in bulk, so as to become protuberances terminating in spines. Leaves in pairs, or without order, composed of three, four, or five pairs of lanceolate leaflets placed opposite, and terminated by an odd one; they are of a deep green on their upper side, and of a yellowish green beneath, a little serrate, and on short foot-stalks. At the end of the branches come forth the peduncles, branching out and forming a loose panicle. It is sometimes called pellitory-tree.—There are two species, the first growing in South Carolina, the second in Pennsylvania and Maryland.

Propagation and Culture.—These plants are generally propagated by seeds, but as they never ripen in this country, they must be procured from those places where they naturally grow, or the plants must be propagated by layers.

XAQUES, a small island of South America, opposite the mouth of the river Plata. Lat. 35. 28. S.

XARAFNEL, a small town in the east of Spain, in Valencia, with 2000 inhabitants; 45 miles west-south-west of Valencia.

XARAMA, or **JARAMA**, a river in the interior of Spain, in the provinces of Guadalaxara and Toledo, which falls into the Tagus, to the west of Aranjuez.

XARAYES, a large and extensive plain of South America, about 300 miles long from north to south, and the depositary, during the rainy season, of the superfluous waters of the Paraguay, by which it is watered, which are spread over the flat country to a great extent, 30 miles in length, and 15 in breadth, and form a large lake, known under this title. At certain times of the year, however, the waters subside, and discover the greater part of the plain; and the river betakes itself to its own bed, although many lakes are still left, of the size of from six to seven leagues in circumference. The land, upon the subsiding of the waters, is found covered with reeds and other plants, resembling arrows. In the general inundation, the navigation is made by canoes and barks; and then the Portuguese of Cuyaba traverse it, passing directly along the river of this name to the Paraguay, which they cannot do when the waters sink, but have to go round about 200 leagues, in order to pass down the river of Los Porrudos to the Paraguay. In the middle of the lake are some islands, covered with some lofty trees, of various kinds, amongst which are found the cassia and the trees distilling gum arabic. When the waters are at their height they overtop these trees by 12 yards. The number of crocodiles here are immense.

XAVIER, SAN, a river of Mexico, in North America. It takes its rise on the western side of the mountains, which form the point of separation between the streams that flow into the gulf of Mexico, and those which flow into the Pacific ocean. It falls into the river De los Dolores, a little before its confluence with the San Rafael, where their united streams form the great Rio de Colorado of California.

XAVIER, ST., an Indian settlement in the province and government of Buenos Ayres, on the west bank of the Parana; 76 miles north-east of Santa Fe. Lat. 30. 32. 15. S. long. 60. 7. 15. W.

XAVIER, ST., another settlement of Indians, in the province and government of Buenos Ayres, situate on a small river on the north bank of the Uruguay, a little to the north-east of Martires, in Lat. 27. 51. 8. S. long. 55. 14. 4. W.

XAVIER, ST., a river of Canada, which runs into the Pickouagamis. Lat. 48. 53. N. long. 73. 50. W.

XAVIER, ST., an island of Canada, at the conflux of the St. Xavier and Pickouagamis.

XAVIER, ST., a town of South America, in the province of Moxes: 180 miles north of Santa Cruz de la Sierra la Nueva.

XAVIER, ST., a town of South America, in the audience of Quito; 30 miles south-east of St. Josef de Hualas.

XAVIER, ST., a town of Mexico, in the province of New Biscay; 70 miles west of Parral.

XAVIER, ST., a town of South America, in the province of Chiquitos; 110 miles north-east of Santa Cruz de la Sierra Nueva.

XAVIER, ST., a town of New Navarre; 45 miles south-south-west of Casa Grande.

XAVIER, ST., DE MACAGUANA, a town of South America, in the kingdom of Granada; 100 miles east of Tunia.

XAVIER GOGO, a small seaport of Whidah, in Western Africa; 12 miles north-north-east of Sabi.

XAVIER ZANTE, a small village of Whidah, in Africa; 14 miles north-west of Sabi.

XAUXA, or **JAUXA**, a province of Peru, bounded north and north-east by the province of Tarma, east by the mountain of the Indians, south-east by the province of Huanta, south by that of Angaraes, south-west by that of Yauyos, and west by that of Guarochiri. It is 12 leagues long from north to south, and 15 broad from east to west. This province is a ravine or valley of delightful temperature, although on the heights of either side of it a considerable degree of cold is felt: These heights contain various estates of cattle, the wool of which is manufactured into cloth. Papas, and other fruits peculiar to mountainous countries, are produced here; also great quantities of wheat and barley, with which the inhabi-

tants fatten their herds of swine. Vegetables of all sorts are likewise raised. This province is watered by many streams. In the reign of the incas of Peru, Xauxa was one of the most populous districts, traces of which are still visible, in the numerous remains of towns and large castles. It has some silver mines, but few of these are worked. Population 52,286.

XAUXA, the capital of a district of the same name, situated near the river Xauxa. It has some woollen manufactures.

XAUXA, a large and abundant river of Peru, which has its source in lake Chinchicocha, in the province of Tarma. It traverses the province of Xauxa, passes that of Huanta, dividing it from Angaraes; and, after collecting the waters of many other rivers in its course, enters the Apurimac. It has a beautiful stone bridge across it, called the bridge of Iscuchaca, about 66 miles south of Tarma, which facilitates the pass into the province of Angaraes.

XAUXILLA, a small mud fort of Mexico, in the intendancy of Valladolid, situated on an island just large enough to contain it, in the lake of Zacapo, a short distance from the village of that name. It is surrounded by a swamp or pond, containing five or six feet of water, and can only be reached by canoes. It was visited by Mina, during his unsuccessful inroad into the country.

XAXALES, a small village of Mexico, situated on the Rio del Norte.

XAXO, a settlement of the Caraccas, in the province of Maracaibo, between the cities of Merida and Truxillo.

XE'BE'C, s. [a sea term.] A small three-masted vessel navigated in the Mediterranean. *Chambers.*

XEKIAS, a name given by the Chinese and Japanese to an Eastern philosopher of mythological origin and character, called also Buddas among the Indians, Somonacodom in Siam, and after his death Föe or Fotoki, who fascinated the whole northern and eastern region of Asia, as well as part of the southern, with his pantheistic doctrine. It is probable, as some have said, that he lived about 600 years before Christ; and having first appeared in the southern part of India, on the borders of the Indian ocean, disseminated his philosophy by means of his disciples to all India. It is said that he spent twelve years in solitude, when he was instructed by the Tolopoin, called by the ancients "hylobii," i. e. sylvan hermits; and that in his 30th year he devoted himself to contemplation, and attained to the intuitive knowledge of the first principles of all things, from which he took the name of Föe, which signifies, "something more than human." His mystical philosophy was delivered to his innumerable disciples under the veil of allegory. The Japanese add, that in his contemplations, during which his body remained unmoved, and his senses unaffected by any external object, he received divinè revelations, which he communicated to his disciples.

Buddas, or Xekias, in his esoteric doctrine, taught the difference between good and evil; the immortality of the souls of men and brutes; different degrees of rewards and punishments in a future world; and the final advancement of the wicked, after various migrations, to the habitations of the blessed. Amidas, who, according to the Chinese, is Xekias himself, presides in these habitations, and is the mediator, through whose intercession bad men obtain a mitigation of their punishment. These dogmas are contained in an ancient book, called Kio, which all the Indians beyond the Ganges, who follow the doctrine of Xekias, receive as sacred, and which is illustrated by innumerable commentaries.

The doctrine of Föe, or Xekias, was embraced by innumerable disciples. Among these, one of his most eminent successors was Tamo, a Chinese, who was so entirely devoted to contemplative enthusiasm, that he spent nine whole years in profound meditation, and was on this account deified.

According to the Bramins, Xekias had neither father nor mother; and as no Indian city claims the honour of his birth, he was probably a foreigner, who migrated to the southern

southern part of India from some neighbouring maritime country, perhaps from Lybia; whither he came with some Egyptian colony, and who had been instructed in the Egyptian mysteries. It is not improbable, that at the time when Cambyzes conquered Egypt, and dispersed almost the whole nation, this impostor might have passed over into India, and, propagating his doctrine among an ignorant and superstitious people, became an object of universal veneration.—*Brucker's Philos. by Enfield.*

XELSA, a small town in the north-east of Spain, in Aragon, on the Ebro; 31 miles south-east of Saragossa.

XENDAY, a considerable town of Nippon, in Japan; 115 miles north-east of Jedo.

XENIA, a post town of the United States, and chief town of Green county, Ohio, on the Shawnoe Creek; 3 miles from the Little Miami, 30 south-west of Urbana, and 55 north-north-east of Cincinnati. It is a flourishing town, and contains a court-house, a jail, an academy, and had, in 1817, about 600 inhabitants. There are two houses of public worship in the village, and another in sight, two of brick, and the other of stone. The houses recently built, are chiefly of brick and stone.

XENIL, or GENIL, a river of Spain, which rises near Granada, and flows into the Guadalquivir at Palma.

XENOCRATES, a famous Grecian philosopher, was born at Chalcedon, in the first year of the 96th Olympiad (B.C. 396), and attached himself at first to Æschines, but afterwards became a follower of Plato, and succeeded Speusippus in the chair of the old academy (B.C. 339). His temper was gloomy, his aspect severe, and his manners were little tinged with urbanity. Plato took pains to correct these obliquities of his disposition and character; and as he highly respected his master, he probably improved by his instruction, so that he was reckoned as one of his most esteemed disciples. Xenocrates was held in such estimation among the Athenians for his virtues, and especially his integrity, as well as his wisdom, that in a public trial his simple asseveration was accepted instead of an oath, which was usually required; and that even Philip of Macedon found it impossible to corrupt him. Dreading his influence, and the temptation of a bribe, he declined all private intercourse with the Macedonian sovereign, and was honoured by him with this testimony; that of all persons who had come to him on embassies from foreign states, Xenocrates was the only one whose friendship he was not able to purchase. On occasion of being employed as an ambassador to the court of Antipater, for the redemption of several Athenian captives, he waved the honour of accepting the invitation of this prince to sit down with him at supper, in the words of Ulysses to Circe, cited from Homer's *Odyss.* (l. x. v. 383); thus translated,—

“What man, whose bosom burns with gen'rous worth,
His friends enthrall'd, and banish'd from his sight,
Would taste a selfish, solitary joy?”

The patriotic spirit expressed in this appropriate passage gratified Antipater so much, that he immediately released the prisoners. As another example of his moderation, it is alleged, that when Alexander, wishing to mortify Aristotle, on account of some accidental pique, sent Xenocrates a magnificent present of fifty talents, he accepted only thirty minæ, returning the residue to the donor with this message; that the whole sum was more than he should have been able to spend during his whole life. In this instance, he also manifested a superiority to that kind of jealousy and revenge which might have actuated meaner minds, when it is considered that Aristotle had instituted a school in the Lyceum, in opposition to the academy over which Xenocrates presided. In the use of food he was singularly abstemious; his chastity was invincible by the seducing arts of Phryne, a celebrated Athenian courtesan; and his humanity was testified by the shelter which he afforded to a sparrow that was pursued by a hawk, and fled into his bosom, where he allowed

it to remain till its enemy was out of sight, alleging that he would never betray a suppliant. In the employment of his time, he allotted a certain portion of each day to its proper business, one of which he devoted to silent meditation. His high sense of the importance and utility of mathematical studies was sufficiently evinced by his refusing to admit into his academy a young man who was ignorant of geometry and astronomy, because he was destitute of the handles of philosophy. Upon the whole, Xenocrates was eminent, both for his purity of morals, and his acquaintance with science; and he supported the reputation of the Platonic school by his lectures, his writings, and his conduct. His life was prolonged to the third year of the 116th Olympiad (B.C. 314), or the 82d year of his age, when he accidentally fell in the dark into a reservoir of water.

His philosophic tenets were Platonic; but in his lectures he adopted the language of the Pythagoreans. In his system, unity and diversity were principles in nature, or gods; the former being the father, and the latter the mother of the universe. The heavens he represented as divine, and the stars as celestial gods; and besides these divinities, he taught that there are terrestrial demons, of a middle order between the gods and men, partaking of the nature both of mind and body, and, like human beings, capable of passions, and liable to diversity of character. He probably conceived with Plato, that the superior divinities were ideas, or intelligible forms, proceeding immediately from the Supreme Deity, and the inferior gods, or demons, to be derived from the soul of the world, and, like that principle, compounded of a simple and a divisible substance, or of that which always remains the same, and that which is liable to change. *Diogen. Laert. Plut. de Virt. Mor. De Is. et Osir. De Anim. Gent. Cicero de Nat. Deor. Brucker's Hist. Phil. by Enfield.*

XENO'DOCHY, *s.* [*Ξενοδοχία*, Gr.] Reception of strangers; hospitality. *Cockeram.*

XENOPHANES, the founder of the Eleatic sect, was born at Colophon, about the 56th Olympiad (B.C. 556); and having left his country, took refuge in Sicily, where he gained a subsistence by reciting, in the court of Hiero, elegiac and iambic verses, which he had written against the theogonies of Hesiod and Homer. From Sicily he removed to Magna Græcia, where he became a celebrated preceptor in the Pythagorean school, without adhering strictly to the doctrines of Epimenides, Thales, and Pythagoras. His life was prolonged to the advanced age of 100 years, that is, till the 81st Olympiad (B.C. 456), during 70 years of which he occupied the Pythagorean chair of philosophy. In *Enfield's Philosophy of Brucker* we have the following summary of the doctrine of Xenophanes:—In metaphysics, he taught, that if ever there had been a time when nothing existed, nothing could ever have existed. That whatever is, always has been from eternity, without deriving its existence from any prior principle; that nature is one and without limit; that what is one is similar in all its parts, else it would be many; that the one infinite, eternal, and homogeneous universe, is immutable and incapable of change; that God is one incorporeal eternal being, and, like the universe, spherical in form; that he is of the same nature with the universe, comprehending all things within himself; is intelligent, and pervades all things; but bears no resemblance to human nature either in body or mind.

In physics, he taught, that there are innumerable worlds; that there is in nature no real production, decay, or change; that there are four elements, and that the earth is the basis of all things; that the stars arise from vapours, which are extinguished by day, and ignited by night; that the sun consists of fiery particles collected by humid exhalations, and daily renewed; that the course of the sun is rectilinear, and only appears curvilinear from its great distance; that there are as many suns as there are different climates of the earth; that the moon is an inhabited world; that the earth, as appears from marine shells, which are found at the tops of mountains, and in caverns far from the sea, was once a gene

ral mass of waters; and that it will at length return into the same state, and pass through an endless series of similar revolutions.

XENOPHILES, an able Greek musician, who professed the philosophy of Pythagoras, and who lived at Athens, where he arrived at the great age of 105. It is Lucian who gives this account of his extraordinary longevity from Aristoxenus.

XENOPHON, the son of Gryllus, an Athenian, was distinguished as a philosopher, commander, and historian. His engaging appearance whilst he was a youth induced Socrates to admit him into the number of his disciples. Under his tuition he made rapid progress in that kind of wisdom for which his master was so eminent, and which qualified him for all the offices of public and private life. Having accompanied Socrates in the Peloponnesian war, and manifested his valour in defence of his country, he afterwards entered into the army of Cyrus as a volunteer; but his enterprise against his brother proving unfortunate, Xenophon, after the death of Cyrus, advised his fellow-soldiers to attempt a retreat into their own country rather than to surrender themselves to the victor. His advice was regarded, and he was chosen as their commander. In the exercise of this duty he acquired by his prudence and firmness a high degree of honour; and the memorable adventure is related by himself in his "Retreat of the Ten Thousand." Having joined Agesilaus, king of Sparta, after his return into Greece, and fought with him against the Thebans in the celebrated battle of Chæronea, he displeased the Athenians by this alliance; and he was publicly accused for his former engagement in the service of Cyrus, and condemned to exile. Thus ignominiously treated, the Spartans took him under their protection, and provided for him a comfortable retreat at Scillus, in Elis. In this asylum he enjoyed the pleasures of domestic life with his wife and two children for several years, and availed himself of the leisure that was thus afforded him by writing those historical works which have rendered his name immortal. On occasion of a war between the Spartans and Eleans, he was obliged to abandon this agreeable retreat, and to join his son, who was settled at Lepreus. From hence he afterwards removed with his whole family to Corinth, where, in the second year of the 105th Olympiad (B. C. 359), his life terminated, at the age of about 90. As a philosopher, he was an ornament to the Socratic school by his integrity, piety, and moderation; and in his whole military conduct, he was distinguished by an admirable union of wisdom and valour. As a writer, he has presented to succeeding ages a model of purity, simplicity, and harmony of language, expressing sentiments truly Socratic. By his wife Phitiesia he had two sons, Gryllus and Diodorus; the former of whom ended his life with military glory in the battle of Mantinea. The news of his son's death was communicated to him whilst he was offering sacrifice; and upon receiving it, he took the crown from his head, uttering with a sigh these memorable words, "I knew that my son was mortal:" but when he heard that he had fought bravely, and died with honour, he again put on the crown, and finished the sacrifice. As an historian, he may be considered in his "Hellenics" as the continuator of Thucydides, and as having brought down the affairs of Greece to the battle of Mantinea. His "Cyropædia," or "Institution of Cyrus," is generally regarded as a work of fiction rather than of real history, exhibiting, under the name of the elder Cyrus, the picture of a perfect prince, according to his own conception of the character. His "Anabasis" (or Ascent) is an account of that memorable expedition of the younger Cyrus, in which he himself appears so conspicuous. This work appeared under the name of Themistogenes of Syracuse, to whom Xenophon himself ascribes it; nevertheless it has been universally ascribed to Xenophon; but if this be the case, it must have been written from memory, long after the events, which are differently related by Diodorus. Among his political works we may enumerate his accounts of "The Republic and Laws of Sparta;" "Of the Republic of Athens

and its Revenues;" his "Praise of Agesilaus;" and his "Hiero, or Dialogue on Tyranny." Of a miscellaneous class, he wrote a treatise on "Oeconomics;" "On Hunting;" and "On the Office of Master of the Horse." The character of Xenophon, portrayed in his writings, seems to have exemplified virtue and humanity, kind and generous feelings, and a considerable degree of piety blended with superstition. In his Anabasis he exhibits a singular degree of credulity and regard to celestial warnings, which, in his view of them, governed his conduct, and were miraculously verified by the event. For his preference of the Spartan to the Athenian government and manners, derogating from his patriotism; the only apology is his banishment. His style has been always admired for its purity, simplicity, and clearness; and his works are reckoned amongst the most popular of the Greek classics, and have passed, collectively and separately, through several editions.—*Laertius. Ælian. Hist. Var. Fabr. Bib. Græc. Brucker's Philos. by Enfield.*

XEUETEPEQUE, a village of South America, in the province of Sana, in Peru, about a mile from the river of the same name. It is on the road from Valles to Lima.

XERANTHEMUM [from *ξηρος*, dry, and *ανθος*, a flower], in Botany, a genus of the class syngenesia, order polygamia superflua, natural order of compositæ discoideæ, corymbiferæ (*Juss.*)—Generic Character. Calyx common, imbricate; scales lanceolate; the innermost longer than the disk, membranaceous, shining, forming a coloured ray, and crowning the compound flower. Corolla compound, unequal; corollets hermaphrodite, numerous, tubular in the disk. Females fewer, tubular in the circumference.—Proper of the hermaphrodites funnel-form, much shorter than the calyx; border five-cleft, spreading. Females tubular, length of the hermaphrodite, five-cleft, less regular.—Stamina in the hermaphrodites: filaments five, very short. Anther cylindrical, tubular, almost the length of the corollet. Pistil in the hermaphrodite: germ short. Style filiform, longer than the stamens. Stigma bifid. In the females: germ as in the hermaphrodites. Style filiform, length of the hermaphrodites. Stigma simple, club-shaped. Pericarp none. Calyx scarcely changed. Seeds in the hermaphrodites oblong, crowned with a five-cleft, acute calycle. In the females similar to the hermaphrodites. Receptacle flattish, chaffy.—*Essential Character.* Calyx imbricate, rayed, with the ray coloured. Down bristle-shaped. Receptacle chaffy.

I.—Receptacle chaffy. Down five-bristled.

1. *Xeranthemum annuum*, annual xeranthemum, or immortal flower.—Calyx-scales obtuse, scariose, the interior ones of the ray lanceolate, obtuse, spreading. Root annual. Stalk two feet high, slender, stiff and branching, covered with a white down, and channelled the whole length. It varies with white and purple, double and single flowers.—Native of the south of Europe.

2. *Xeranthemum inapertum*.—Calyx-scales acute, membranaceous at the edge, the interior ones of the ray lanceolate, acute, converging. The stalks of this do not rise more than a foot high, and do not branch so much as the preceding. The leaves are narrower, and the whole plant is very hoary. The flowers are not half so large; but the scales of the calyx are very neat and silvery.—Native chiefly of Austria; the second of Italy, Switzerland, and the south of France.

3. *Xeranthemum Orientale*.—Calyx-scales roundish, scariose, the interior ones of the ray ovate, acuminate, erect; chaffs of the seed-down ovate, awned, longer than the calyx. This rises about the same height as the first sort.—Found in Armenia by Tournefort.

II.—Receptacle naked. Down hairy.

4. *Xeranthemum vestitum*, or upright xeranthemum.—Shrubby, erect; leaves sessile, lanceolate-linear, woolly-tomentose, sharpish; the floral ones appendicled, with a membrane at the tip; branches one-flowered. The whole plant

plant is covered with a very thick nap, whence its trivial name. A variety differs only in having the calyx-scales brownish at the tip.—All the species that follow, except the 11th, 17th, and 27th, are natives of the Cape of Good Hope.

5. *Xeranthemum spirale*, or spiral-leaved xeranthemum.—Shrubby, erect; leaves sessile, lanceolate, tomentose, keeled beneath and spirally imbricate; branches one-flowered.

6. *Xeranthemum speciosissimum*, or showy xeranthemum.—Shrubby, erect; leaves sessile, lanceolate-obovate, acute, three-nerved, woolly-tomentose; branches one-flowered.

7. *Xeranthemum fulgidum*, or great yellow-flowered xeranthemum.—Suffruticose, erect; leaves embracing, ovate-lanceolate, pubescent beneath, tomentose at the edge; branches subtriflorous.

8. *Xeranthemum proliferum*.—Shrubby, branched, diffused, proliferous; leaves roundish-ovate, smooth, convex, closely imbricate; flowers sessile.

9. *Xeranthemum imbricatum*.—Shrubby, branched; leaves oblong-lanceolate, silky, imbricate; branches one-flowered; peduncles scaly.

10. *Xeranthemum canescens*.—Shrubby, erect; leaves oblong, obtuse, imbricate; branches one-flowered; calyx-scales ovate.

11. *Xeranthemum bellidioides*.—Herbaceous; leaves ovate, embracing, snowy-tomentose beneath; branches one-flowered; peduncles naked.—Native of New Zealand.

III.—Receptacle naked. Down feathered.

12. *Xeranthemum argenteum*.—Shrubby, erect; leaves oblong, silky, recurved.

13. *Xeranthemum recurvatum*.—Shrubby, erect; leaves lanceolate, tomentose, ciliate, recurved; branches one-flowered.

14. *Xeranthemum retortum*, or trailing xeranthemum.—Shrubby, branched, decumbent; leaves lanceolate, silky, somewhat recurved; branchlets one-flowered; peduncles scaly.

15. *Xeranthemum stoloniferum*.—Herbaceous, creeping; leaves lanceolate, silky, recurved-spreading; branches one-flowered.

16. *Xeranthemum radicans*.—Herbaceous, creeping; leaves ovate, obtuse, silky, reflexed.

17. *Xeranthemum frigidum*.—Herbaceous, branched, pro-cumbent; leaves imbricate, in four rows, oblong, blunt, hoary; branches one-flowered; flowers sessile.—Found in the highest parts of Mount Libanus; also in Corsica.

18. *Xeranthemum spinosum*.—Shrubby, erect; leaves lanceolate, obtuse, tomentose; branchlets one-flowered; calyx-scales mucronate-spiny.

19. *Xeranthemum sesamoides*.—Shrubby, erect; leaves acerose, linear, keeled, smooth, pressed close; branches one-flowered; flowers sessile.

20. *Xeranthemum fasciculatum*.—Shrubby, erect; leaves acerose, linear, subcylindrical, tomentose above; lower spreading; upper pressed close; branches one-flowered; peduncles scaly.

21. *Xeranthemum virgatum*.—Shrubby, erect; leaves lanceolate, tomentose, remote, spreading; branches one-flowered; flowers peduncled.

22. *Xeranthemum striatum*.—Leaves linear, nerved, villose; stem erect.

23. *Xeranthemum lancifolium*.—Leaves lanceolate, acute, silvery; peduncles scaly.

24. *Xeranthemum Stæhelinæ*.—Shrubby, erect; leaves oblong-lanceolate, attenuated at the base, silky; peduncles naked, one-flowered, terminating.

25. *Xeranthemum variegatum*.—Shrubby, erect, branched; leaves oblong, tomentose, imbricate; branches one-flowered; flowers nodding.

26. *Xeranthemum paniculatum*.—Shrubby, erect; leaves linear-lanceolate, silky; corymb simple, terminating.

27. *Xeranthemum Chinense*.—Stem herbaceous, quite simple; leaves lanceolate, serrate.—Native of China, about Canton.

Propagation and Culture.—The first three species are propagated by seeds. The other sorts, being mostly shrubby, and not ripening their seeds in England, are propagated by cuttings, planted on a bed of light earth, during any of the summer months, and shaded from the sun.

XERES, a town of the Caraccas, now reduced to a miserable village, 15 leagues south of Valencia.

XERES, a town of Mexico, in the intendency of Zacatecas. It formerly carried on an extensive commerce. Its population now consists almost entirely of people of colour; 47 leagues north of Guadalupe, and 25 miles south of Zacatecas. Lat. 22. 40. N.

XERES DE BAJADOS, or XERES DE LOS CABALEROS, a considerable inland town of the south-west of Spain, in Estremadura, on the small river Ardilla. It contains 8700 inhabitants, has manufactures of linen and leather, and in the environs very extensive pastures, it being reckoned, that at least 50,000 head of cattle reared in this neighbourhood, are disposed of at the annual fairs, and sent to the surrounding towns. It is situated 90 miles north-west of Seville, and 34 south of Badajoz; but being remote from the coast, and from any great road, is rarely visited by travellers.

XERES DE LA FRONTERA, a large and ancient town in the south-west of Spain, in Andalusia; 16 miles north-north-east of Cadiz. It is agreeably situated on the banks of the small river Guadalete, in the midst of one of the richest and best cultivated districts of Spain. The entrance into the town from Cadiz, is striking, and passes by the end of a pleasant and well shaded public walk. The interior is better than that of most Spanish towns: the streets are wider than those of Cadiz, are well lighted, clean, and neatly paved, and some of the houses are splendid. The town is surrounded with a wall, contains a large square, and has a very neat council-house. Here are four churches of considerable size, but none are so remarkable as the convent of the Carthusians, a magnificent building, 2 miles from Xeres containing a number of beautiful paintings.

Xeres is a place of great antiquity; it is supposed to be built on the site of the ancient *Asta Regia*; and the old and new towns are separated by a wall of Roman erection, still in good preservation, and of such thickness, that the merchants have excavated cellars in it for their wines. It was on a plain adjoining to this town that was fought, in 711, the famous battle between the Moors and the Goths, in which the latter were completely defeated, their king, Roderick, slain, and their empire overturned.

The population of Xeres is between 20,000 and 30,000. The pueblo or district belonging to the town, is of the size of one of our Welsh counties (45 miles in length and 18 in breadth), but so thinly peopled as not to contain 5000 inhabitants. The chief trade of the town is in wine, the growers of which are, as in other parts of Spain, so destitute of capital, as to be enabled to raise their annual produce only by advances from the merchants. The climate, however, is very good; and this is the country of the wine known under the name of Sherry, a corruption of Xeres. There are also some sweet wines produced in this neighbourhood, of which the best known is the *vino tinto*, or tent wine.

XERES DE LA FRONTERA, a village of Paraguay, once flourishing, but now in ruins. It was situated between the Paraguay and Parana.

XERICA, or ZERICA, a walled town of the east of Spain, in Valencia; 81 miles west-north-west of Segorbe. Population 2300.

XEROPHAGY, *s.* [*xerophagie*, French; from the Gr. ξηρος, *dry*, and φαγω, *to eat*.] Dry food; subsistence on dry victuals.—Practising new and extraordinary fasts, as three Lents, and two weeks of *xerophagy*, in which they eat nothing but dry things. *Christian*.

XERTE, a small town of the north of Spain, in the province of Leon.

XERTIGNY, a village of France, department of the Vosges, on the river Amery. Population 2600.

XERXES, was the son of Darius I. by Atossa, the daughter

ter of Cyrus; and on the death of his father, succeeded to the crown of Persia, in the year 485 B. C. See PERSIA.

XETAFE, a small town in the interior of Spain; 9 miles south of Madrid.

XEXUY, a river of Paraguay, which enters the Paraguay above the city of Assumption.

XEXUY-GUAZU, a river of the same province, which has a course nearly the same as the former river.

XEXUY-MINI, a small river of the same province, which runs south-south-west, and enters the Xexuy.

XIBACA, a town of Nippon, in Japan; 130 miles south-west of Meaco.

XICALTEPEC, an Indian settlement of Mexico.

XICAPOTLA, a settlement of Mexico, containing 157 Indian families.

XICOCO, or SIKOKU, an island, the smallest of the three which compose the empire of Japan. It is about 100 miles in length, and 60 in breadth. It is separated only by narrow straits from the island of Nippon on the one side, and Ximo on the other. This island is inaccessible, and almost entirely unknown, to Europeans.

XICOTLUN, a settlement of Mexico, in the intendency of La Puebla, containing 260 Indian and Spanish families; 45 leagues south-east of Mexico.

XILOCA, a river of Spain, in Arragon, which joins the Xalon at Calatayud.

XILO-KASTRO, a small town of European Turkey, in the Morea, built on the site of the ancient *Ægira*. It was destroyed in 1770, and still remains in a dilapidated state; 20 miles west-north-west of Corinth.

XILOTEPEC, a town of Mexico, and capital of a district of the same name, containing 3700 Indian families; 60 miles north of Mexico.

XILOTEPEC, another settlement in Vera Cruz, containing 162 families of Indians.

XILOTEPEC, a settlement of Mexico, containing 120 families of Indians.

XILOTLAN, a settlement of Mexico, containing 80 Indian families.

XIMABARA, a town of Ximo, in Japan, situated on a gulf to which it gives name; 33 miles east of Mangasaki.

XIMAGUINO, a town of Xicoco, in Japan; 10 miles south of Awa.

XIMBURA, a settlement of Quito, in the province of Loxa.

XIMENA, a small town of Spain, in the province of Seville; 66 miles south-south-east of Seville.

XIMENES (Francis, Cardinal), was born in 1437, in Old Castile, and educated at Alcalá and Salamanca. Renouncing preferences which he obtained in his youth, he assumed the habit of St. Francis, in a monastery of the Observantines, one of the most rigid orders of monks in the Romish church. Distinguished by his austerities and devotional practices, he became confessor to queen Isabella; and still retaining his customary modes of living, he so far engaged her respect and attachment, that he was nominated by her to the archbishopric of Toledo, the richest benefice in Europe next to the papal see; but his real or affected reluctance to accept this high preferment could be overcome only by the authority of the pope. In this elevated station he maintained his strict adherence to the rigours of the order to which he belonged, and so far from relaxing in his severities, he indulged them to the extreme of self-mortification and penance. Having thus acquired a complete mastery over his own passions, and possessing political talents in a very high degree, he was thought peculiarly fitted to exercise dominion over others; and accordingly Ferdinand and Isabella entrusted him with a principal share in the administration. When a strong party was formed among the Castilians to deprive Ferdinand of the authority as regent, devolved upon him by the will of the queen, he was deserted by every person of distinction except Ximenes and two nobles; and after he had resigned it to the archduke Philip, he again acquired it upon Philip's death in 1506, by the influence of Ximenes. In 1507 Ximenes was created a cardinal by pope Julius II.; and in the following year he undertook the conquest of Oran, and of other places

on the coast of Barbary, with an armament, the expense of which he offered to defray out of his own revenues, and he succeeded in this enterprise. Such was Ferdinand's confidence in the abilities and integrity of the cardinal, that when he was dying in 1516, he appointed him regent of Castile until the arrival of his grandson Charles. Although he was then in his 79th year, he took an active part in securing the throne to Charles, though in his own judgment he disapproved the king's conduct, who in his assumption of power contended the declared opinion of the Cortes. With no less firmness and inflexibility, he prosecuted a plan for extending the royal authority, which the nobility had very much circumscribed. The measures which he adopted for this purpose excited violent opposition, but he persisted, and ultimately succeeded. During his administration he was also engaged in two foreign wars; one for the preservation of the kingdom of Navarre, in which he was successful, and another against Horuc Barbarossa, who advanced himself from the condition of a corsair to the sovereignty of Algiers and Tunis, in which the Spaniards were totally defeated. When Charles was prevailed upon by Ximenes to visit Spain, the cardinal took a journey towards the coast to meet his majesty; but being disabled to proceed by the attack of a disorder, supposed to be the effect of poison, he requested an interview with the king; but Charles having conceived prejudices against him, returned a cold answer, with permission for his retirement to his diocese, that he might finish his days in tranquillity. In a few hours after the receipt of this letter, he expired, November, 1517, at the age of 80 years.

Ximenes was held in high estimation by his superstitious countrymen, under a delusive idea that he possessed the gift of prophecy, and a power of working miracles. But his more unequivocal claims to their respect were founded on his extraordinary talents and learning, his liberal patronage of literature, and the munificence of his public charities, to which he devoted the immense revenues of his archbishopric. At Alcalá he built the magnificent college of St. Ildefonso, endowed with forty-six professorships, and conducted under excellent regulations. Here he printed the Complutensian Polyglott, the Mozarabic liturgy, and the theological works of Tostatus. Here he also established a splendid monastery for the education of indigent females of quality, which served as a model for that of St. Cyr, under Lewis IV. The granaries which he constructed remained without decay for centuries; and upon the whole he was justified in declaring on his death-bed, that to the best of his knowledge he had not misapplied a crown of his revenue. *Robertson's Charles V.*

XIMENEZ, a settlement of South America, in the province of Tucuman.

XIMENIA [So named by Plumier, in honour of the Reverend Father *Francis Ximenes*, a Spaniard, author of an account of the Animals and Plants of New Spain, 1615], in Botany, a genus of the class octandria, order monogynia, natural order of aurantia (*Juss.*)—Generic Character. Calyx: perianth one-leafed, four-cleft, acuminate, very small, permanent. Corolla: petals four, oblong, hairy within, below erected into a tube, above rolled back. Stamina: filaments eight, erect, short. Anthers linear, erect, obtuse, length of the corolla. Pistil: germ oblong. Style filiform, length of the stamens. Stigma obtuse. Pericarp: drupe subovate. Seed: nut roundish.—*Essential Character.* Calyx four-lobed. Petals four, hairy, rolled back. Drupe: one-seeded.

1. *Ximenia Americana*.—Leaves oblong, peduncles many-flowered. This rises with a woody stem twenty feet high, sending out several branches on every side, armed with thorns. Flowers terminating.—Native of the West Indies; about Carthage, St. Domingo, Hispaniola, &c.

2. *Ximenia elliptica*.—Leaves elliptic-lanceolate, peduncles many-flowered. This has no thorns. Native of New Caledonia.

3. *Ximenia inermis*.—Leaves ovate, peduncles one-flowered. This is a very bushy tree, divided much towards the top, not above eight or nine feet in height. Trunk about four

four inches and a half in circumference.—Native of Jamaica.

Propagation and Culture.—These trees are propagated by seeds, which must be procured from the countries where they grow naturally; they should be sown in pots filled with light earth, and plunged into a good hot-bed of tanner's bark. If the seeds are fresh, the plants will appear in six weeks or two months. When these are about three inches high, they must be each carefully transplanted into a separate small pot filled with light earth, and plunged into a good hot bed of tanner's bark, where they must be shaded from the sun till they have taken new root: then they must be treated in the same manner as other tender plants from the warm countries.

XIMO, or KRUSU, an island of Japan, second in magnitude to Nippon. It is upwards of 200 miles in length, about 150 in breadth, and contains many excellent harbours, and flourishing cities. It is said to have formerly composed a kingdom by itself, but is now subjected to the general sway. It is remarkable as the only part of the empire into which Europeans can procure admission. It contains Nangasaki, to which the Dutch are still allowed to send their annual vessel; and near its coast is also Firando, where the Portuguese had an establishment, from which, however, they are now entirely banished. In other respects, Ximo is as little known to Europeans as the rest of the empire.

XIMONOSEQUI, a seaport on the south-west coast of Nippon, in Japan, having an excellent harbour, and carrying on a considerable trade. Lat. 33. 50. N. long. 132. 20. E.

XIPHIDIUM [from *ἔιφος*, a sword: from the shape of the leaves], in Botany, a genus of the class triandria, order monogynia, natural order of ensatæ, irides (*Juss.*)—Generic Character. Calyx none. Corolla: petals six, of which the three outer are larger. Stamina: filaments three, opposite to the inner petals. Anthers ovate. Pistil: germ superior. Style filiform. Stigma simple. Pericarp: capsule at first fleshy, then dry, roundish, three-grooved, three-celled. Seeds numerous, roundish, (inserted into a globular receptacle).—*Essential Character.* Corolla six-petalled, equal. Capsule superior, three-celled, many-seeded.

1. *Xiphidium album.*—Leaves smooth, petals linear-lanceolate.—Native of the West Indies.

2. *Xiphidium cæruleum.*—Leaves hirsute, petals ovate. A perennial plant: root jointed, fibrose: stem simple, cylindrical, hairy, a foot or more in height: leaves alternate, remote, flat, striated, long, acute, serrulated: flowers paniculated, terminal: footstalk of each flower guarded at the base by a small scale.—Native of Guiana.

XIPHILINUS (John), was born at Trebizond, in the 11th century, and having passed the earlier period of his life in a monastery on mount Olympus, was advanced to the patriarchate of Constantinople, which office he held till his death in 1075. Besides a sermon printed in the Bibliotheca Patrum, he is reputed by some to be the author of an "Abridgement of the History of Dion Cassius," in Greek, written faithfully, which was printed at Paris in 1592, fol.

XIPICAPA, a settlement of Quito, in the province of Guayaquil, about 6 miles from the Pacific ocean, in Lat. 1. 23. S.

XIQUILPAN, a town of Mexico, and chief place of a district of the same name, containing 158 Indian families, and 186 of Spaniards, mulattoes, &c.

XIXONA, an inland town of the east of Spain, in Valencia, among the mountains. It has a castle, on a hill overlooking the town; and in the environs is produced an immense quantity of cochineal. Almonds also form a principal article of export; 15 miles north-north-west of Alicant. Population nearly 5000.

XOCA, a small river of South America, in New Granada, which runs south-east, and enters the Apure.

XOCHIMILCO, one of the five lakes in the valley of Mexico. Its water is pure and limpid; and it is about 6½ square leagues in extent. It is separated from Lake Chalco

by a narrow dyke. Between the extremities of this lake and of Lake Tezcoco, is situated the city of Mexico. It is about six miles distant from Lake Xochimilco, with which, however, it communicates by means of a canal; and thus its commerce with the surrounding country is greatly facilitated.

XOCOTEAPA, S. PEDRO DE OAXACA, a settlement of Mexico, in the district of Acayuca; 100 leagues south-east of Mexico, containing 350 Indian families.

XOCOTEPEC, a settlement of Mexico; 91 miles north-east of Mexico, containing 212 Indian families.

XONACATEPEC, a settlement of Mexico, containing 813 Indian families.

XONACATLAN, a settlement of Mexico, in the district of San Juan de los Llanos; 38 leagues east of Mexico, containing 540 Indian families.

XOXUTLA, a settlement of Mexico, containing 316 Indian families.

XUCAR (the *Sucro* of the ancients), a large river in the east of Spain, which rises in the Sierra de Molina, on the east borders of New Castile. It waters part of the province of Cuença, flowing nearly south, and enters the province of Valencia, where it changes its direction towards the east, and, after a very winding course of about 140 miles, discharges itself into the Mediterranean at Cullera.

XUCHALTENGO, a settlement of Mexico, containing 80 families of Indians and mulattoes.

XUCHIAPAS, a settlement of Mexico, containing 96 Indian families.

XUCHITLAN, a settlement of Mexico, in the same district, containing 190 families of Indians.

XUCURAY, a river of Quito, in the province of Mainas, which runs nearly from south to north, and enters the Amazonas.

XULI, a town of Peru, in the diocese of La Paz, near the west coast of Lake Titicaca, chiefly inhabited by Indians, and governed by Indian magistrates; 100 miles north-north-west of La Paz. Lat. 16. 25. S. long. 70. 6. W.

XULI, a small island in the Pacific ocean, near the coast of Peru. Lat. 16. 50. S.

XULLA ISLANDS, four islands in the Eastern seas, situated to the south-east of the Molucca passage. Xulla Bessey, which is the most considerable of them, is about 11 leagues in length, in good cultivation, and well inhabited. The Dutch fort is near a village adjacent to the south-east point, where ships may procure refreshments. The island abounds with wax and honey. These islands are occasionally invaded by the Papuas from New Guinea, though the distance is nearly 300 miles. The English formed a settlement some years since, on one of these islands; but from the badness of the soil, and some other circumstances, were induced to abandon it, and remove to Balumbangan, on the coast of Borneo.

XULLABELLA, an island in the Eastern seas, about 25 miles long and 6 broad. Lat. 2. 15. S. long. 126. 12. E.

XULLAMANGOLA, an island in the Eastern seas, about 30 miles long, and 10 broad. Lat. 1. 54. S. long. 125. 42. E.

XUN, a city of China, of the second rank, in the province of Sechuen. Lat. 30. 18. N. long. 103. 20. E.

XUNGAPEO, a settlement of Mexico, containing 37 Spanish, and 223 Indian families.

XUXUY, or JUJUY, SAN SALVADOR DE, a city of South America, in the province of Tucuman, founded a little before Salta, and after being twice destroyed by the Indians of Chaco, was rebuilt for the third time in 1593. It is a small town, containing about 300 houses, and 3000 inhabitants, who carry on some trade with Potosi. They might derive great benefit from the rich ores in the neighbourhood, but they have neither sufficient enterprise nor skill to make a proper use of the advantages they possess in this respect. It stands at the foot of one of the high mountains of the Cordillera, and upon a river which falls into the Vermejo. It is the most northerly place of the province, being within one degree of the tropic; 61 miles north-north-east of Salta, and 275 north of Santiago del Estero. Lat. 23. 19. S.

XYLANDER (William), whose family name was *Holtzmann*, was born in indigent circumstances at Augsburg, in 1532, and enabled by public liberality to study at Tubingen and Basil, in the latter of which places he took the degree of M. A. in 1556. In 1558 he was invited to undertake the Greek professorship at Heidelberg; where, with all the disadvantages of penury, he pursued his literary labours, and acquired an amplitude of erudition, which comprehended the learned languages, history, poetry, music, philosophy, and physics. The works by which he is chiefly known are Latin translations, (with notes,) of Dion Cassius, Plutarch, Strabo, and Cedrenus. His life was prematurely terminated in consequence of hard study, in 1576, at the age of 44 years. *Moreri*.

XYLOCARPUS [from *ξύλον*, wood, and *καρπος*, a fruit. The fruit being hard, like wood], in Botany, a genus of the class octandria, order monogynia.—Generic Character. Calyx: perianth one-leaved, club-shaped, coriaceous, somewhat coloured, four-toothed: teeth rounded. Corolla: petals four, ovate-oblong, somewhat coriaceous, spreading very much, twice as long as the calyx. Nectary erect, ovate-inflated, somewhat fleshy: mouth eight-cleft. Stamina: filaments the eight segments of the nectary, linear, obtuse, emarginate, shorter than the corolla. Anthers eight, fastened to the inner side of the filaments, linear-oblong, retuse, length of the stamens. Pistil: germ ovate, smooth, somewhat wrinkled at the base. Style thick, very short. Stigma retuse, wide, margined: margin grooved; disk decussately grooved, perforated. Pericarp: drupe large, juiceless, globular: rind thick, smooth on the outside, marked with four or five grooves, within woody, fibrous. Seed: nuts eight, ten or more, angular, unequal, difform; rind externally silky and soft, internally woody and fibrous: kernel somewhat woody, brittle: heart protuberant.—*Essential Character*. Calyx four-toothed. Corolla four-petalled. Nectary eight-cleft. Filament inserted into the nectary. Drupe juiceless, large, four or five-grooved. Nuts eight or ten, difform.

Xylocarpus granatum.—This is a tree of various dimensions, commonly of a large size, but sometimes only a shrub. Trunk erect, covered with a cloven hard dusky chestnut-coloured bark, and of a middling thickness. Frond oblong, sometimes subglobular opaque. Larger boughs scattered; smaller commonly opposite, covered with an ash-coloured bark, numerous. Leaves opposite, spreading, oblong-club-shaped, rounded, or sometimes oblong, acute, quite entire, scarcely convex on the upper surface, smooth, shining, dark green; on the lower surface veined, with the midrib more prominent stiffish, a little bigger than apple leaves. Racemes scattered on the branches, sometimes axillary, somewhat erect, ovate-oblong, small, shorter than the leaves, partial ones opposite, terminating ones commonly trichotomous and spreading very much. Peduncles round, smooth, tough, red, naked. Peduncles shorter than the flower.—Native of the East Indies; in woods that grow in the ouze on the sea-coast, among the Rhizophoras.

XYLOGRAPHY, *s.* [*xylographic*, Fr.; from the Gr. *ξύλον*, wood, and *γράφω*, to write.] The art of engraving on wood. Of very recent usage.

XYLOMELUM [from *ξύλον*, wood, and *μήλον*, an apple], in Botany, a genus of the class tetrandria, order monogynia, natural order of proteæ (*Juss.*)—*Essential Character*. Ament with a simple scale. Petals four, stamiferous. Stigma club-shaped, obtuse.—Habit altogether of Brabeium; but it has a wooden capsule, opening at the top on one side, and containing two winged seeds, not an almond-like drupe with one seed. Many of the flowers with a smaller stigma are abortive.—Native of Australasia. This is one of twenty new genera, from the South Seas, the characters of which are given by Dr. Smith.

XYLOPHYLLA [from *ξύλον*, wood, and *φύλλον*, a leaf], in Botany, a genus of the class pentandria, order trigynia, natural order of tricocææ, euphorbiæ (*Juss.*)—Generic Character. Calyx: perianth five-parted. Corolla none, (unless the calyx be so called). Nectary: six glands at the base of

the germ, or a rim surrounding the germ. Stamina: filaments five, very short. Anthers shorter than the flower. Pistil: germ roundish. Styles three, short. Stigmas jagged, (or bifid). Pericarp: capsule roundish, three-celled. Seeds two in each cell. It should be referred to Triandria Trigynia; but most of the species are monicous and polygamous. It differs from *Phyllanthus* only in having the flowers from the notches of the leaf.—*Essential Character*. Calyx five-parted (six-parted), coloured. Corolla none. Stigmas jagged. Capsule three-celled. Seeds two.

1. *Xylophylla longifolia*, or long-leaved sea-side laurel.—Leaves linear; branches four-cornered. Stem suffruticose, even.

2. *Xylophylla latifolia*, or broad-leaved sea-side laurel.—Leaves pinnate, broad-lanceolate, crenate, flowers peduncled hermaphrodite, six-stamined, and females mixed. Stem shrubby, one or two feet high. Branches irregular, roundish-compressed.—Native of the West Indies, on maritime calcareous rocks.

3. *Xylophylla arbuscula*.—Leaves pinnate, lanceolate, acuminate, subcrenate coriaceous; flowers peduncled, three-stamined monoicous. A most elegant, evergreen plant, with a woody stem, about three feet high, very simple, and upright, and about a finger's thickness: bark ash-coloured, marked with tubercles from the fallen leaves.

4. *Xylophylla falcata*, or sickle-leaved sea-side laurel.—Leaves scattered, linear-lanceolate, somewhat sickle-shaped, crenate; flowers subsessile, three-stamined monoicous. This is a shrub of five or six feet height, with many upright stems growing from the root.—Native of the West Indian Islands.

5. *Xylophylla angustifolia*, or narrow-leaved sea-side laurel.—Leaves pinnate, linear-lanceolate, marked with lines crenate; flowers peduncled, hermaphrodite. This tree grows fifteen or sixteen feet high, with branches regularly grown, which together with the shining green colour of the leaves make a very beautiful appearance: the leaves continue green all the year. It grows naturally upon the rocks near the sea in the islands of the West Indies.—Native of the Bahama islands.

6. *Xylophylla montana*.—Leaves distich, broad-lanceolate, gash-crenate; branches acropital at the top, flowers sessile.—Native of Jamaica.

7. *Xylophylla ramiflora*.—Leaves elliptic, flowers axillary.—Native of Siberia, among the rocks of the mountains Charabon and Tschir.

Propagation and Culture.—All these, except the last, being natives of the East and West Indies, are tender and must be kept in the bark stove.

The fifth sort must be placed in a moderate stove in winter, and in summer it may be placed in the open air, in a warm sheltered situation. The roots strike so deep into the crevices of the rocks, as to render it almost impossible to transplant the plants; and the seeds will not grow, unless they are sown soon after they are ripe.

XYLOPIA, in Botany, a genus of the class polyandria, order polygynia, natural order of coadunata, anonæ (*Juss.*)—Generic Character. Calyx: perianth three-leaved: leaflets ovate, concave, sharpish, deciduous. Corolla: petals six, sessile, linear-lanceolate, coriaceous; the three outer larger and thicker. Stamina: filaments scarcely any. Anthers numerous, oblong, fastened to the receptacle at the base of the germs. Pistil: germs from two to fifteen, very small, fastened to a three-cornered receptacle. Styles none. Stigma long, very slender. Pericarp: capsules two to fifteen, pedicelled, four-cornered, compressed, coriaceous, one or two-celled, two-valved. Seeds solitary or two together, roundish, smooth, within a succulent hemispherical aril.—*Essential Character*. Calyx three-leaved. Petals six. Capsules one or two-seeded, four-cornered, two-valved. Seeds arilled.

1. *Xylopiia muricata*, or rough-fruited bitter-wood.—Leaves lanceolate, acuminate, strigose beneath, bearded at the tip, peduncles many flowered, fruits muricate. This tree grows to the height of fifteen or sixteen feet.—Native of Jamaica.

2. *Xylopiia frutescens*, or shrubby bitter-wood.—Leaves lanceolate,

lanceolate, acuminate, silky beneath, smooth at the tip; peduncles one, or many-flowered; fruits smooth.—Native of Guiana and Brazil.

3. *Xylopia glabra*, or smooth-fruited bitter-wood.—Leaves oblong-ovate, smooth; peduncles one-flowered subgeminate; fruits smooth. This tree grows to a considerable size, and will sometimes raise its branches to the height of fifty or sixty feet. The wood, bark, and berries have an agreeable bitter taste, not unlike that of the orange seed.—Native of Barbadoes and Jamaica.

The common name of bitter-wood was translated into the Greek *Xylopieron* or *Xylopicron*, for a generic appellation, by Plukenet and Browne. Linnæus shortened it into *Xylopia*, a name of no meaning.

XYLOSMA [from *ξύλον*, wood, and *σμή*, a sweet smell], in Botany, a genus of the class dioecia, order polyandria. Male.—Calyx: perianth four or five-parted: leaflets roundish, minute, spreading. Corolla none. Nectary very small, annular, crenulate, surrounding the stamens. Stamina: filaments numerous (20—50) capillary, twice as long as the calyx. Anthers roundish, small. Female. Calyx, and corolla, and nectary, as in the males. Pistil: germ ovate-globular. Style scarcely any, cylindrical. Stigma obtuse, flat, indistinctly trifid. Pericarp: berry dry, oblong, subbilocular. Seeds two, three-sided, convex on the back, flat on the sides. Partition incomplete in the bottom of the berry.—*Essential Character*. Calyx four or five-parted. Corolla none: but a small annular crenulate nectary surrounding the stamens. Male. stamina twenty to fifty. Female. Style scarcely any. Stigma trifid. Berry dry, subbilocular. Seeds two, three-sided.

1. *Xylosma suaveolens*.—Leaves ovate, serrate.

2. *Xylosma orbicularum*.—Leaves roundish, quite entire.

The first of these is a native of the Society isles; the second of Savage island.

Forster first named this genus *Myroxylon*, because the natives use the wood to perfume the coco-nut oil, with which they anoint their hair: but he changed it afterwards, to avoid its being confounded with the tree which yields the Balsam of Peru, and which had before been named *Myroxylon*.

XYRIS [*ξύρις*, of Dioscorides, *ξύρις*, of Theophrastus, *xyris* of Pliny. Derivation unknown], in Botany, a genus of the class triandria, order monogynia, natural order of ensatæ, junci (*Juss.*)—*Generic Character*. Calyx: spike roundish; scales roundish, concave, imbricate, separating the flowers. Glume two-valved, small; valves boat-shaped, compressed, bowed, acute, converging. Corolla: petals three, flat, spreading, large, crenate; claws narrow, length of the calyx. Stamina: filaments three, filiform, shorter than the corolla. Anthers erect, oblong. Pistil: germ superior, roundish. Style filiform. Stigma triple. Pericarp: capsule roundish, one-celled, three-valved, opening by a cleft at the corners. Seeds numerous, very small, adhering to a raised rib in the middle of each valve.—*Essential Character*. Corolla three-petalled, equal, crenate. Glumes two-valved in a head. Capsule superior.

1. *Xyris Indica*.—Leaves ensiform, sheathing the scape; head globular; scales roundish. Scapes several, a foot high.—Native of the East Indies.

2. *Xyris pauciflora*.—Leaves linear-subulate, sheathing the scape; head oblong; scales ovate, obtuse.—Native of Malabar.

3. *Xyris Americana*.—Leaves three-sided, linear-subulate, distinct at the base; head oblong; scales lanceolate, acute.—Native of South America.

4. *Xyris Capensis*.—Leaves linear, very short; head ovate, acute; scales obtuse.—Native of the Cape of Good Hope.

Y A C

Y.

Y A C

Y, At the beginning of words, is commonly taken for a consonant; at the end, and when it follows a consonant, is a vowel, and has the sound of *i*. It is used at the end of words, and whenever two *ii*'s would come together; and in words derived from the Greek, to express the *u*. **Y** was much used by the Saxons, whence *y* is found for *i* in the old English writers.

Y is in old English sometimes prefixed as an increasing syllable to preterites, and passive participles of verbs. It seems borrowed from *ze*, the Saxon *augmentum* of the preterite. It is sometimes put before present tenses.

Y, an arm or inlet of the Zuyder Zee, in the Netherlands, on the south shore of which is built the city of Amsterdam.

Y, a town of China, of the third rank, in Kiangnan.

Y, a town of China, of the third rank, in Shantung.

Y, a city of China, of the second rank, in Shantung. Lat. 35. 10. N. long. 118. 19. E.

YA, a city of China, of the second rank, in Sechuen. Lat. 30. 9. N. long. 102. 39. E.

YABAGUE, one of the Lucayos or Bahama islands, situated south-west of Meguana island. Lat. 22. 30. N.

YABARI, **YAVARI**, or **YAHUARI**, a large river of Peru, which runs into the Amazons, in Lat. 47. S.

YABARKULSKAIA, a village of Tobolsk, in Asiatic Russia, on the Irtysh; 120 miles east of Tobolsk.

YABAZA, a river of South America, in the province of Darien, which runs from east to west, and enters the Chucupaqui.

YABEVIRI, a river of Peru, in the province of Chaco, which runs from north-west to south-east, and enters the Paraguay.—There is another river of the same name in Paraguay.

YACA, a river of Paraguay, which runs east, and enters

the Parana.—There is another river of the same name, which also runs into the Parana.

YACA, a river of New Granada, which enters the Putumayo.

YACAN, a settlement of Peru.

YACANTO, mountains of Chili, in the province of Cuyo.

YACARE, a river of South America, which runs south, and enters the Uruguay.

YACARE-GUZAU, a river of South America, in Buenos Ayres, which runs west, and enters the Parana.

YACARE-MINI, a river of South America, in Buenos Ayres, which runs west, and enters the Parana.

YACAYOBI, a river of Paraguay, which runs south-south-west, and enters the Picazura.

YACHAN, a town of China, of the third rank, in Kiangnan.

YACHT, *s.* [a Dutch word.] A small ship for carrying passengers.—The evening before, we met, off the sound, Lord Sandwich in the Augusta *yacht*. *Cook's Voyage*.

YACINTO, *St.*, a town of Brazil, on the Tapajós; 40 miles south of Pauxis.

YACONG TALA, a number of small lakes in Thibet, situated near each other.

YACUAPIRI, a river of Brazil, which runs north-north-west, and enters the Madera.

YACUI, a river of Buenos Ayres, which runs west, and enters the Uruguay.

YACUI, a river of Paraguay, which runs south-south-east, and enters the Ucay.

YACUMARE, a settlement of New Granada, in the district of Pamplona.

YACUMBE, a settlement of the Caraccas, in the province of Maracaibo, to the south-south-east of the city of Tocuyo.

YADDLETHORPE,

YADDLETHORPE, a township of England, in Lincolnshire.

YADI, a small river of Asiatic Russia, which falls into the Obskaia gulf. Lat. 67. 25. N. long. 72. 38. E.

YADKIN, a river of the United States, in North Carolina, which rises between the Alleghany and Brushy mountains, passes through the counties of Wilkes, Surrey, Rowan, Montgomery, and Anson, and flows into South Carolina. In Montgomery county it passes over narrows occasioned by mountains on each side, which contract it from 200 yards wide to about 30. A few miles below the narrows it receives Rocky river, and then takes the name of Great Pedee. The whole descent of the river, from Abbot's creek to Mountain creek, just below the narrows, a distance of 24 miles, is 321 feet. This river was surveyed in 1818, with a view to ascertain the best mode of opening a water communication from the western part of the state; and it was determined that it could be effected only by clearing the river of rocks, and canalling along the narrows and great falls. The navigation must always be bad. Above Abbot's creek, the navigation is said to be tolerably good.

YAFFORTH, or **YAFFORD**, a township of England, North Riding of Yorkshire.

YAGO, St. See **SANTIAGO**.

YAGO, St., or **St. JAGO**, a town of North America, in California; 120 miles west of Loretto.

YAGUACHE, a district of Quito, in the province of Guayaquil. It produces cacao, with cotton and wood, and great herds of cattle.

YAGUACHE, or **St. JACINTO DE YAGUACHE**, a settlement of Peru, and principal place of a lieutenancy, in the province of Guayaquil; 25 miles north-east of Guayaquil.

YAGUAJES, a settlement of Quito, in the province of Quixos and Macas.

YAGUARA, a river of New Granada, in the province of Popayan, which, running from west to east, in a serpentine course, enters the Magdalena.

YAGUARAIBA, a small river of Brazil, in the province of San Vincente, which runs north-north-west, and enters the Parana.

YAGUARATU, a river of Brazil, in the province of San Vincente, which enters the Parana.

YAGUARI, a river of Paraguay, which runs south-south-west, and enters the Picazuru.

YAGUARICARA, a small river of Brazil, in the province of Para, which enters the Topayos.

YAGUARIPE, a river of Brazil, which runs into the Atlantic. Lat. 13. 12. S.

YAGUAROCHA, a large and very deep lake of South America, in Quito, a league and a half in length, 1 league from the town of Ibarra. It is famous for having been the sepulchre of the inhabitants of Otobalo. Upon this place being taken by Huana Capac, the 12th inca, he, instead of shewing any clemency to them on account of their magnanimity, being exasperated at the noble resistance which they made against his army, ordered them all to be beheaded, both those who had quietly surrendered, as well as those taken in arms, and their bodies to be thrown into the lake: so that, from the waters of the lake being tinged of a bloody colour, it acquired its present name, which signifies "a lake of blood." Lat. 0. 23. N.—There is a settlement of the same name on its banks.

YAGUARON, a settlement of Indians, in the province of Paraguay; 25 miles south-east from Assumption. Lat. 25. 33. S. long. 57. 18. W.

YAGUEPIRI, a river of Brazil, which runs into the Negro; 50 miles above Fort Rio Negro.

YAGUERA, a settlement of New Granada, in the province of Neiva.

YAGUI, a small river of Paraguay, which runs east, and enters the Parana.

YAHEBIRI, a river of South America, which runs into the Parana. Lat. 24. 20. S.

YAHUALICA, a settlement of Mexico, containing 80

Indian families, and 60 of Spaniards, mestizoes, and mulattoes.

YAHUGO, a settlement of Mexico, in the district of Villalta, containing 147 Indian families.

YAHUIBE, a settlement of Mexico, in the district of Villalta, and 105 leagues from Mexico.

YAITCHNEL, a small island of Asiatic Russia, in the gulf of Penginskaia. Lat. 60. 30. N. long. 160. 50. E.

YAKOUTSK, an extensive province of Asiatic Russia, forming one of the four into which the government of Irkoutsk is divided. It extends north from the boundary of the provinces of Irkoutsk proper and of Nertschinsk, as far as the Frozen ocean. It does not, however, reach to the eastern extremity of Asia, on which side it is bounded by the province of Okhotsk. The Lena traverses it through its whole extent from north to south. Through nearly the whole of this vast province, the severity of the climate renders it impossible to raise grain to advantage; and if a crop of rye is sown, its ripening is extremely uncertain. In the neighbourhood of the town of Yakoutsk, the ground in June is frozen three feet deep. The only employment of the inhabitants, therefore, consists in hunting; and these districts at one time were so abundant in valuable furs, as to be called the Peru of Siberia. The sables, however, being now nearly extirpated, the produce of the chase has declined in value, but is still considerable.

The inhabitants of this dreary region bear the name of Yakoutes. They are supposed to have been originally a Tartar race, and to have occupied the countries on the Angara and Upper Lena; but, forced to yield to the violence of the Mongols and Burats, they have taken shelter in the frozen solitudes of the Lower Lena, from the Wittim downwards. The territory occupied by them may be reckoned to extend 18 degrees from north to south, and nearly 50 from east to west. The population does not bear any proportion to this extent. The number of males paying tribute amounts to 34,979; this, it is supposed, may be about the third of the entire number of both sexes. The Yakoutes, as they are seldom able to procure bread, care little for it as an article of diet. Onions, garlic, and other roots, with various sorts of berries, both fresh and preserved, form their chief luxuries. The Yakoutes who inhabit the southern districts, are tolerably rich; they possess the usual size, activity, and vigour; but those farther to the north form a stunted race, indolent and wretched. They are one of the most superstitious races in existence, and are considered by a late traveller as living under a complete demonocracy, being perpetually haunted by the dread of evil spirits. They reckon not less than thirteen tribes of aerial beings, to whom they pay homage. The Shamans, or magical impostors, enjoy unbounded influence, and obtain the first places at their banquets. The Tartar liquor of koumiss, or fermented mare's milk, forms the chief luxury of their feasts; though brandy, when it can be procured, is also eagerly swallowed. The Yakoutes, for a long time after their first subjection to the Russians, continued to view that nation with great hostility; but of late, since justice has been equally and diligently administered, they submit very quietly to the yoke.

YAKOUTSK, a town of Asiatic Russia, capital of the province of the same name. It is situated on the western bank of the Lena, on a plain surrounded by mountains, which inclose it at the distance of 10 or 12 miles. It contains 500 or 600 houses, and 3000 inhabitants, who, for the most part, are Cossacs or Yakoutes. Notwithstanding its desolate situation, it is a place of some trade. It forms the emporium of all the furs which are collected in the extensive regions to the north; and it imports all the Russian and Asiatic commodities which are given in exchange. It forms also a species of *entrepôt* for the Russian trade with Kamtchatka and the western coast of America. The cold is excessive; and during winter the inhabitants are almost entirely confined to their houses, the day-light not continuing above a few hours. This season is consumed almost entirely in sleeping and drinking. Ice, by a singular process, is used here

here for warming the houses. It is found the most effectual mode of stopping up every chink and crevice, and is applied, like a double glass, to the outside of the windows. Lat. 60. 2. N. long. 140. 8. E.

YALALA, a settlement of Mexico, in the district of Villalala, containing 435 Indian families.

YALARO, an arm of the great river Madera, in South America.

YALATLACO, a settlement of Mexico, containing 277 Indian families.

YALDHAM, a hamlet of England, in the parish of Wrotham, Kent.

YALDING, a parish of England, in Kent; 5 miles south-west of Maidstone.

YALE, a town of the island of Ceylon, situated on a small river of the same name. Lat. 6. 52. N. long. 85. 20. E.

YALEPUL, the name of two inconsiderable towns in the island of Ceylon.

YALLAH'S BAY, a bay of the island of Jamaica, on the south coast, situated to the east of Yallah's Point.

YALLAH'S POINT, a cape on the south coast of Jamaica; 12 miles south-east of Kingston. Lat. 17. 53. N. long. 76. 21. W.

YALLAH'S RIVER, a river of Jamaica, which runs into the sea, a little to the east of Yallah's Point.

YALME, a river of England, in Devonshire, which enters the sea, near Plymouth.

YALOFFS, or **JALOFFS**, an active, powerful, and warlike race of negroes, and esteemed the most handsome of those people, who inhabit a great part of that tract of Africa which lies between the Mandingo states, on the river Gambia to the south, and the Senegal to the north and east.

The Yaloffs differ from the Mandingoes, not only in language, but likewise in complexion and features. Their noses are not so much depressed, nor the lips so protuberant, as among the generality of Africans; and although their skin is of the deepest black, they are considered by the white traders as the most sightly negroes in this part of the continent. They are divided into several independent states or kingdoms; which are frequently at war either with their neighbours, or with one another. In their manners, superstitions, and government, however, they have a greater resemblance to the Mandingoes than to any other nation; but excel them in the manufacture of cotton cloth, spinning the wool to a finer thread, weaving it in a broader loom, and dyeing it of a better colour. Their language is said to be copious and significant, and is often learnt by Europeans trading to Senegal.

We cannot forbear mentioning an anecdote that redounds very much to the honour of Damel, their king. On occasion of a war between Damel and Abdulkader, king of Foota Torra, a country to the west of Bondon, the latter, inflamed with zeal for propagating his religion, sent an ambassador to Damel, accompanied by two of the principal Bashreens, who carried each a knife, fixed on the top of a long pole. When they obtained admission into the presence of Damel, they announced the object of their embassy in the following singular manner:—"With this knife," said the ambassador, "Abdulkader will condescend to shave the head of Damel, if Damel will embrace the Mahometan faith; and with this other knife, Abdulkader will cut the throat of Damel, if Damel refuses to embrace it—take your choice." Damel coolly replied, that he had no choice to make; he neither chose to have his head shaved, nor his throat cut: and with this answer the ambassador was civilly dismissed.

Abdulkader with a powerful army invaded Damel's country. The inhabitants of the towns and villages filled up their wells, destroyed their provisions, carried off their effects, and abandoned their dwellings as he approached. Thus he was led on from place to place, until he had advanced three days' journey into the country of the Yaloffs. Several of his men had died with fatigue and hunger by the way. This led him to direct his march to a watering-place in the woods, where his men, having allayed their thirst, lay down, overcome with fatigue, to sleep among the bushes. In this situation, they were attacked by Damel before day-break, and completely

routed. Many were killed, and a greater number taken prisoners. Among the latter was Abdulkader himself, who was led, as a miserable captive, into the presence of Damel. The behaviour of Damel on this occasion is celebrated, in terms and sounds of the highest approbation, by the singing men. When his royal prisoner was brought before him in irons, and thrown upon the ground, the magnanimous Damel, instead of setting his foot upon his neck, and stabbing him with his spear according to the custom in such cases, addressed him in the following manner:—"Abdulkader, answer me this question. If the chance of war had placed me in your situation, and you in mine, how would you have treated me?" "I would have thrust my spear into your heart," returned Abdulkader with great firmness; "and I know that a similar fate awaits me." "Not so," said Damel; "my spear is indeed red with the blood of your subjects killed in battle, and I could now give it a deeper stain by dipping it in your own; but this would not build up my towns nor bring to life the thousands who fell in the woods. I will not therefore kill you in cold blood; but I will retain you as my slave, until I perceive that your presence in your own kingdom will be no longer dangerous to your neighbours; and then I will consider of the proper way of disposing of you." Abdulkader was accordingly retained, and worked as a slave for three months; at the end of which period, Damel listened to the solicitations of the inhabitants of Foota Torra, and restored to them their king.

YAM, *s.* A root, that grows in America and the South Sea islands. *Mason*.—Both ships were by this time crowded with a great number of the natives, who brought with them cocoa-nuts, plantains, bananas, apples, *yams*, and other roots. *Cook's Voyage*.

YAMACHICHE, a seignory of Lower Canada, in the county of St. Maurice.

YAMARI, a river of Brazil, which enters the Madeira.

YAMASKA, a river of Canada, which runs into the St. Lawrence. Lat. 46. N. long. 72. 45. W.

YAMASKA, a seignory of Lower Canada, on the south side of the St. Lawrence, in the county of Buckingham.

YAMBAJALCA, a settlement of Peru, in the province of Chachapoyas.

YAMBE, a settlement of Quito, in the province of Esmeraldas.

YAMBRASAMBA, a settlement of Peru, in the province of Chachapoyas.

YAMENA, a settlement of New Granada, in the province of San Juan de los Llanos, from which place it is 6 miles north.

YAMEOS, a settlement of Quito, in the province of Mainas, on the shore of the river Amazons. Lat. 4. 26. S.

YAMIMKA, a small river of Asiatic Russia, in the government of Tobolsk.

YAMINA, a town of Bambarra, in Central Africa, on the Niger. It has a very fine appearance at a distance, and covers as much ground as Sansanding; 70 miles west-south-west of Sego.

YAMON BAY, a bay on the north coast of the island of Lucon. Lat. 14. 21. N. long. 122. 37. E.

YAMOR, a settlement of Peru, in the province of Caxatambo.

YAMPARAES, a province of Peru, which begins a little to the eastward of the city of La Plata, and extends to the limits of the district of Santa Cruz de la Sierra. The capital is of the same name, and is 30 miles north-west of Chuquisaca or La Plata. Population 7000.

YAMSKOI, a fortress of Asiatic Russia, in the government of Okhotsk, at the mouth of the river Yama, about 300 miles north of Okhotsk.

YAMUTHA, one of the Aleutian islands. Lat. 53. 40. N. long. 180. 29. E.

YAMYCHEFSKAIA, a fortress in the government of Tomsk, and district of Biisk, situated on a high bank, to the right of the Irtysh. It was built in 1715, in order to form part of the fortified line of that river. It was constructed at first only of wood; but in 1765 was rebuilt of earth, and

200 well built houses were attached to it, with barracks for the garrison, magazines, and a stone church. The only inconvenience to which the inhabitants are liable, arises from an accumulation of sand, which, when the wind blows in a certain direction, comes from the bank of the river. Lat. 60. 12. N. long. 77. 50. E.

YANA, a river of Quito in the province of Mainas, which after a very long and winding course, turns north-north-east, and enters the Amazons.

YANABAYA, a settlement of Peru, in the province of Larecaxa.

YANABINI, a river of South America, which has its rise in the flat country that runs along the great river Amazons; and running from east to west, enters the Parima.

YANAC, a settlement of Peru, in the province of Castro Virreyna.

YANACA, a settlement of Peru, in the province of Aimaraez.

YANACACHE, a settlement of Peru, in the province of Sicasica.

YANACOA, a settlement of Peru, in the province of Canes and Canches.

YANAPAMPA, a settlement of Peru, in the province of Quispicanchi.

YANAQUIJUJA, a settlement of Peru, in the province of Arequipa.

YANAS, a settlement of Peru, in the province of Conchucos.

YANASSA, a river of Quito, in the province of Quixos and Macas, which rises in the mountains, and running nearly from north to south, enters the Morona. Lat. 3. 17. S.

YANAUCA, or YANAURA, a small island at the mouth of the river Amazons, between the coast of Guiana and the island of Marajo; 10 miles north of Caviana.

YANA-URCU, a very lofty mountain in the north part of Quito, in the province of Otavalo. It is covered with perpetual snow, and gives rise to many streams. Lat. 0. 28. N.

YANA-YACU, a small river of Quito, in the province of Mainas, which runs north-north-west, and enters the Yana, near its source.

YANCAO, a settlement of Peru, in the province of Chancay.

YANCEYVILLE, a post village of the United States, in Louisa county, Virginia, on the St. Anna; 60 miles north-west of Richmond.

YANERI, a settlement of Mexico, in the district of Villalta, containing 98 Indian families; 100 leagues from Mexico.

YANFONG, a town of Corea; 40 miles east-south-east of Ou-tchuen.

YANG, a town of China, of the third rank, in Chan-si, near the river Han.

YANG, a town of China, of the third rank, in Yunan.

YANG, a town of Corea; 13 miles east of King-ki-tao.

YANGA, a settlement of Peru, in the province of Canta.

YANG-CHAN, a town of China, of the third rank, in Quang-tong.

YANG-CONG, a river of China, which runs into the Kincha river.

YANG-HO, a river of China, which joins the San-cam-ho. Lat. 40. 23. N. long. 112. 49. E.

YANG-KANG, a town of China, of the third rank, in Tche-kiang; 22 miles south-east of Kin-hoa.

YANG-KIAN, a town of Chiua, of the third rank, in Quang-tong.

YANG-KIN, a town of the kingdom of Corea; 15 miles south-east of King-ki-tao.

YANG-LI, a city of China, of the second rank, in Quang-see. Lat. 22. 54. N. long. 106. 35. E.

YANG-OU, a town of China, of the third rank, in Honan.

YANG-SIN, a town of China, of the third rank, in Shantung; 12 miles north of Vouing.

YANG-SO, a town of China, of the third rank, in Quang-see; 8 miles north-east of Pinglo.

YANG-TCHEN, a town of Corea, in Tchusin; 155 miles south-south-west of King-ki-tao.

YANG-TCHEOU, a city of China, of the first rank, in Kiang-nan, situated on the bank of the Royal Canal, where it crosses the great river Yang-tse-kiang. It carries on a great trade in all manner of Chinese goods, and is rendered extremely populous, chiefly by the sale and distribution of the salt that is made on the sea coasts of this jurisdiction and parts adjoining, and which is afterwards carried along small canals made for this purpose, which end in communication with the great canal; 485 miles south-south-east of Pekin. Lat. 32. 26. N. long. 118. 54. E.

YANG-TCHING, a town of China, of the third rank, in Honan.

YANG-TCHUEN, a town of Corea; 35 miles west-south-west of King-ki-tao.

YANG-TCHUN, a town of China, of the third rank, in Quang-tong.

YANG-TE, a town of Corea; 84 miles east of Hantcheou.

YANG-TSE-KIANG, a river of China, the largest of that empire, and certainly one of the noblest in the world. Its source has never been viewed by Europeans, but is described by Chinese maps as situated among the mountains of Thibet. Thence it flows, during the first part of its course, along the borders of China; after which it enters the empire, and passes, in a westerly course, through Sechuen, Houquang, and Kiangnan, the grand central provinces; among which it diffuses commerce and fertility. In passing the great city of Nankin, it becomes truly magnificent, from the fleets of vessels of every description moving to and fro; the continued succession of cities, towns, and villages; the varied aspect and high cultivation of the surrounding country; about 120 miles to the east of Nankin, it falls into the gulf of Tsongming, in the Eastern sea.

YANGUA, a small river of Paraguay, which runs west, and enters the Parana.

YANGUIN, CHAINWAH, a town of the Birman empire, situated on the east bank of the Irrawuddy river, and is the station of a custom-house. Lat. 9. 17. 7. N. long. 5. 45. E.

YANGUITLAN, a settlement of Mexico, in the intendancy of Mexico. It formerly contained 10,000 inhabitants; but it is now decayed, and does not contain above 900 Indian families.

YANI, a small kingdom of Western Africa, on the northern bank of the Gambia, to the east of Bursalem. It is divided into Upper and Lower.

YANI, a settlement of Peru, in the province of Cochabamba.

YANKO, a town of China, of the third rank, in the province of Shantung.

YANKTON INDIANS, on the Missouri; 918 miles from its mouth. Number 4200.

YANQUL, a settlement of Peru, in the province of Collahuas.

YANTA, a settlement of Peru, in the province of Canta.

YANTALO, a settlement of Peru, in the province of Chachapoyas.

YANTCHIN, or VANTCHIN, a city of China, of the second rank, in Quangsee. Lat. 23. 1. N. long. 106. 51. E.

YANTIC, or NORWICH, a river of the United States, in Connecticut, which joins the Schetucket, at Norwich.

YANWATH, a township of England, in Westmoreland; 13 miles north-west of Appleby.

YANWORTH, or ENWORTH, a township of England, in Gloucester, near North Leach.

YAO, a city of China, of the second rank, in Chan-si. Lat. 35. 54. N. long. 103. 31. E.

YAO-NGAN, a city of China, of the first rank, situated in the frontier province of Yunan. Near it is a well, producing very white salt. Lat. 25. 33. N. long. 101. E.

YAO-TCHEOU, a town of Mantchou Tartary, on the north-eastern frontier of China. Lat. 40. 43. N. long. 122. 14. E.

YAO-TCHEOU, a city of China, situated on the northern side of the Poyang lake. It extends about a league and a half

half along a fine river, which falls into it. It is chiefly supported by being the port for the immense quantities of porcelain manufactured in the neighbouring city of Kinteching. It thus supports a great population. Lat. 29. N. long. 116. 14. E.

YAO-YAM, a town of China of the third rank, in Pechele.

To YAP, *v. n.* [a contraction of *yelp*, or *yaulp*, as it was formerly written.] To bark.—A voice not unlike the *yapping* of a cur. *L'Estrange*.

YAPA, a settlement of Peru, in the province of Chachapoyas.

YAPE, a river of South America, in the province of Darien, which rises in the mountains of the interior, and running from east to west, enters the Tuira.

YAPEL, a settlement of Chili, in the province of Santiago.

YAPEYA, an Indian settlement of the province of Buenos Ayres, on the west bank of the Uruguay. Lat. 29. 31. S. long. 56. 38. W.

YAPEYU, a large settlement of Paraguay. Lat. 29. 28. S.

YAPHAM, a township of England, East Riding of Yorkshire; 2 miles north-north-west of Pocklington.

YAPITINGO, a river of Brazil, in the province of Ilheos, which runs east, and enters the bay.

YAPO, a river of Brazil, in the province of San Vincente, which runs north, and enters the Paranapané.

YAPTON, a parish of England, in Sussex; 3 miles south-west of Arundel. Population 512.

YAPUI, a rapid river of South America, in the vicerealty of Buenos Ayres, which enters the Paraguay from the west.

YAQUARI, a small river of Paraguay, which runs west, and enters the Parana.

YAUQUE, a large and abundant river of St. Domingo, which rises in the mountains of Ciboo, runs north, and, on passing opposite the city of Santiago, turns its course to the west; then collecting the waters of all those which flow to the sea, disembogues itself in a very abundant stream on the north coast, forming a great mouth on the side of the Point of Monte Christi. Port St. Yaque is at the mouth of the above river.

YAUQUEACU, a river of Brazil, in the province of Pernambuco, which runs south-south-east, and enters the Atlantic.

YAUQUEHIRI, a river of the Portuguese country along the banks of the Amazons, which runs from north to south, and enters the Parima.

YAUQUESON, PORT, a port on the north coast of the island of St. Domingo, within the bay of Barbacoas.

YAQUIA, a settlement of Peru, in the province of Conchucos.

YAQUINI, a small river of Paraguay, which runs west and enters the Parana.

YARACUY, a river of South America, in the province of Venezuela, and government of the Caraccas, which rises in the ridge of mountains to the east of Barquisimeto, and enters the sea in the bay of Burburata, between Port Cabello and the Point of Chiribiche. Its source is 40 leagues to the south of the river Aroa; but it only becomes navigable two leagues east of St. Philip. It is then very convenient for conveying the produce raised in the vallies of St. Philip, and in the plains of Barquisimeto, which is sent by sea to Porto Cabello, the nearest port.

YARAPAZI, a small river of the Portuguese country along the Amazons, which rises between the Amazons and the Caqueta, and enters the former, near the junction of the Caqueta.

YARAUCA, an arm of the river Amazons, which enters by the south side, and forms the island of Guaricura.

YARBA. See JARRA.

YARBOROUGH, a parish and hamlet of England, in Lincolnshire.

YARCOMBE, or YARTICOMBE, a parish of England, in Devonshire; 8 miles north-east of Honiton. Population 708.

YARCUND, a city of Cashgar, in that part of Chinese Tartary which goes commonly by the name of Little Bucharia.

It is situated on the eastern side of that great range of mountains which extends northwards from the Himalah, and divides Chinese from Independent Tartary. Being placed at the point where those mountains are usually crossed by the caravans, it has become a kind of emporium for the inland trade of Asia. As the environs are also fertile, the city is very large; it is built of brick dried in the sun, and defended by a strong castle. The Russians carry on some commercial intercourse with Yacund; but it is not frequented by any other Europeans. A river, bearing the name of the city, passes by, and flows eastward to the lake of Lop.

YARD, *s.* [ȝeaprd, Saxon.] Inclosed ground adjoining to an house.—One of the lions leaped down into a neighbour's *yard*, where, nothing regarding the crowing of the cocks, he eat them up. *Brown*.—[ȝeprd, Saxon.] A measure of three feet.—A peecr, a counsellor, and a judge, are not to be measured by the common *yard*, but by the pole of special grace. *Bacon*.—The supports of the sails.

A breeze from shore began to blow;
The sailors ship their oars, and cease to row;
Then hoist their *yards* a-trip, and all their sails
Let fall to court the wind.

Dryden.

YARDLAND, *s.* A quantity of land, various, according to the place; as, at Wimbledon in Surrey it is but fifteen acres; in other counties, twenty; in some, twenty-four; in some, thirty; and in others, forty acres. *Cowley*.

YARDLEY, two parishes of England, one in Hertfordshire, the other in Worcestershire. Population of the former 563; of the latter 1918.

YARDLEY, GOBIONS, a hamlet of England, in Northamptonshire; 5 miles east-south-east of Towcester. Population 508.

YARDLEY, HASTINGS, a parish in the above county; 8 miles east south-east of Northampton. Population 784.

YARDWAND, *s.* A measure of a yard.—All the revolutions in nature can give it nothing more than different degrees of dimensions. What affinity has thinking with such attributes? no more than there is between a syllogism and a *yardwand*. *Collier*.

YARE, *adj.* [ȝearpe, Saxon; from ȝearpian, or ȝýppian, to prepare. *Mr. H. Tooke*.] Ready; dextrous; nimble; eager.

Yare, yare, good Iros, quick;—methinks I hear
Antony call.

Shakspeare.

I do desire to learn, Sir; and I hope, if you have occasion to use me for your turn, you shall find me *yare*. *Shakspeare*.—The lesser [ship] will come and go, leave or take, and is *yare*; whereas the greater is slow. *Raleigh*.

YARE, a river of England, in Norfolk, which rises near the north-west part of the county, and passes by Norwich, whence it is navigable to Yarmouth, below which it falls into the German ocean.

YARE, a settlement of the Caraccas, in the province of Venezuela, on the shore of the river Tuy.

YARFORD, a hamlet of England, in the parish of Kingston, Somersetshire.

YARELY, *adv.* Dextrously; skilfully.

The silken tackles
Swell with the touches of those flower-soft hands
That *yarely* frame the office.

Shakspeare.

YARI, a river of the Portuguese territory, along the Amazons, which runs south-east, and enters the Amazons, in Lat. 0. 49. S.

To YARK. See To YERK.

YARKHILL, or YARCLE, a parish of England, in Herefordshire.

YARLESIDE, a township of England, in Lancashire, near Ulverstone. Population 403.

YARLINGTON, a parish of England, in Somersetshire; 3½ miles west of Wincanton.

YARM, or YAURM, a market town of England, in the North Riding of Yorkshire. It consists chiefly of one main street, running north and south, which is spacious and open;

but

but its beauty is much injured by the shambles and tolbooth, which stand in the centre, and have a ruinous and disgusting appearance. Owing to the low situation of the town, it has suffered greatly by inundation. The first of these floods, from which the inhabitants sustained any considerable damage, happened on the 17th of February, 1753; when, about four in the morning, the banks of the river were broken, and the town was immediately laid under water. About noon, when the flood was at its height, the water was seven feet deep in the highest part of the town, and the lower parts were entirely submerged. The current through the town was so rapid, that many houses were washed down, and all sorts of furniture were seen floating through the street. This flood was occasioned by a vast quantity of snow on the western hills, being suddenly melted by a heavy fall of rain. In the night between the 16th and 17th of November, 1771, Yarm experienced another dreadful visitation, from the greatest land flood remembered in the north of England. The water, in some parts of the town, rose upwards of 20 feet in perpendicular height, and many of the inhabitants were taken into boats, from the roofs of the houses. To these alarming visitations, Yarm may ascribe the decline of its trade and importance. It has no manufacture of any consequence; and corn, butter, hams, bacon, and pork, sent by shipping to London, constitute the principal part of its commerce. The exportation of corn from Yarm seems to have greatly declined, as many large granaries, which have been erected at a great expense for that branch of trade, have for some time been almost useless. With the decline of trade, the population has also decreased; and, in 1801, the town contained only 1300 inhabitants. It also appears that Yarm cannot boast of the salubrity of its situation, as the deaths are about one in 38 annually. The entrance into the town, from the county of Durham, is by a bridge of five arches, built over the Tees about the year 1400, by Walter Skirlaw, bishop of Durham. The arches are pointed, and the structure retained its original and uniform appearance till about 23 years ago, when the arch on the north was widened and rebuilt in a semicircular form, in order, by giving a freer passage to the current of the river, to prevent, or at least to abate, the frequent inundations. But in the years 1803 and 1804, a bridge of cast iron was erected, after the model of that over the Wear at Sunderland. The arch was a circular segment of 180 feet span, and 27 feet in breadth within the balustrades; and the whole weight of the bridge was 250 tons. But, unfortunately, this elegant piece of architecture fell about midnight, January 12th, 1806, owing to the insufficiency of the abutments to resist the great lateral pressure of the arch. In consequence of this accident, the magistrates adopted the plan of widening and repairing the stone bridge, which fortunately had not yet been taken down. Here were anciently two monasteries, both founded by the family of Bruce in the 12th and 13th centuries. The parish church is a little to the west from the town, and though small, is a neat modern structure, having been rebuilt in the year 1730; but it is chiefly remarkable for a beautiful window of painted glass, in which the principal figure is a full length representation of Moses delivering the law from Mount Sinai. The market of Yarm is on Thursday; the fairs are, Thursday before April the 5th, Holy Thursday, August the 2d, for horned cattle, horses, sheep, and cheese; October the 19th, for horned cattle and horses; October the 20th, for sheep and cheese. The October fair is one of the most considerable in the north of England, and brings a great influx of money into the town and the adjacent country; 45 miles north-north-west of York, and 249 north-by-west of London. Population 1431.

YARMARCA, a settlement of Peru, in the province of Chachapoyas.

YARMOUTH, commonly called GREAT YARMOUTH, a seaport and borough of England, in the county of Norfolk. It is in the form of an oblong quadrangle, extending more than a mile in length, and half a mile in breadth. It comprises 33 acres, from the shape of the peninsula on which it stands, having the sea on the east, and on the west the Yare, over which river there is a handsome drawbridge, forming

a communication with the county of Suffolk. It contains four principal streets, running parallel, which are crossed at right angles, by 156 narrower ones, denominated rows. These intersections give the place an appearance of regularity observable only where a town has been built under one uniform plan. The whole is flanked by a wall on the east, north, and south sides, 2240 yards in length; which, with the west side next the river, 2030 yards, make the circumference 4270 yards, or two miles and 750 yards. The church dedicated to St. Nicholas, was erected by Herbert Losinga, in the year 1123; and greatly enlarged in the year 1250. It consists of a nave, two aisles, a transept, and had lately a spire, 136 feet high, which was taken down in the year 1803. The organ is said to be inferior to none, except the celebrated instrument at Haerlem, in Holland. This church, till the year 1716, was the only place of worship for persons of the establishment, when a handsome chapel was erected, and dedicated to St. George. The quay of Yarmouth is justly the pride and boast of the inhabitants; for it is allowed to be equal to that of Marseilles, and the most extensive and finest in Europe, except the far famed one at Seville, in Spain. Its length, from the south gate to the bridge, is 1014 yards, beyond which it extends, for smaller vessels, 1016 yards, making a continuation of one mile, and 270 yards. In many places it is 150 yards broad; and the southern part of the line is decorated with a range of handsome buildings. Yarmouth has long been much frequented as a fashionable watering-place, and furnishes every accommodation for the health, comfort, and amusement of its visitors. A bathing-house, erected in the year 1759, stands upon the beach, and commands a beautiful view of the roads. On each side of the vestibule is a bath, one appropriated to gentlemen, and the other to ladies. The sea water is raised every tide by a horse-mill, into a reservoir, about 50 yards from the baths, whence it is conveyed by pipes. There are also very commodious bathing-machines, but the sand renders them unpleasant of access. A public room was added to this building in the year 1788, where the company are served with tea, wine, &c. During the season, public breakfasts are given here twice a week. A neat theatre was erected in the year 1778, in which plays, during the summer months, are performed four times a week. These, with concerts and other amusements, tend to relieve the dull vacuity attendant upon lounging at a watering-place. There are various other public buildings. The fisherman's hospital is of a quadrangular form, and contains 20 rooms on the ground floor, each of which is intended for an old fisherman and his wife, who have a weekly allowance in money, and an annual allowance of coals. The hospital school, for feeding, clothing, and educating thirty boys and twenty girls, is supported by the corporation. The charity school, in which are clothed and educated seventy boys and thirty girls, is supported by voluntary subscriptions. The town-hall, situated near the centre of the quay, is a handsome building, with a portico of the Tuscan order in front. The council-room, which is also used for assemblies, is a fine well proportioned apartment. At one end is a full length portrait of king George II. in his coronation robes. The grand plan of the new harbour was executed under the direction of Joas Johnson, a Dutchman, who was brought from Holland to conduct the work. He commenced his operations by driving and hedging down large stakes and piles, to make a firm and substantial foundation. This was first done on the north side, and afterwards upon the south, for the purpose of forcing the reflux tide to run out, by a north-east channel, to the sea. The next step was the erecting piers and a jetty, for preventing the haven being overflowed, and preserving, at all states of tide, a sufficient depth of water for the ships to float at their moorings. The principal, or north pier, was at bottom 40 feet wide; at top 20 feet; and in length 235 yards. This was formed with large timber trees, joined and braced together by cross beams and iron-work. For the defence of this pier against the ravages of the ocean, a jetty was erected, in breadth at the base 16 feet; at the upper part eight; and in length 265 yards. The south pier, which is better built than

the

The north pier, is 340 yards long, 30 feet broad, and 30 deep; 24 feet of the depth is generally under water, which, previous to the erection of this pier, was seldom more than three. This was intended for preventing the waters of the old haven from running out south, in their progress to the sea. These piers, &c. have been considerably improved at different periods since their erection, particularly in the mayoralty of alderman Manship. The extent of the haven, between the north and south piers, is 1111 yards. During the late wars, the importance of Yarmouth was greatly increased, owing to its being a grand station for part of the British navy; the roads opposite the town affording safe anchorage for a numerous fleet. Here, accordingly, all the vessels engaged in carrying on the trade of the north of England, and the numerous colliers which pass from Shields, Sunderland, and Newcastle to London, and the shipping from Scotland, resort for protection against easterly storms. The harbour is perfectly secure against every danger, and is provided with two light-houses, one at Caistor, and one at Garleston; yet the coast is the most dangerous in Britain. A melancholy instance occurred in the year 1692, when about 140 sail were driven ashore in one fatal night, and 1000 people perished. In the year 1554 also, 50 sail of ships perished in one day; and a similar catastrophe befel a larger number in 1790. The inhabitants of Yarmouth have experienced great difficulties, and incurred continual and heavy expenses, in forming and preserving the haven from decay. The present annual expenses on the harbour, &c. amount to about 2000*l.* For meeting this vast expenditure, various powers have been granted by 11 different acts of parliament; the last of which was obtained in the year 1800. By virtue of this, the collector has a right to charge, as a harbour tax, one shilling on every chaldron of coals; also on every last of grain and weigh of salt: the same tax is likewise levied on every ton of goods of a different description, fish excepted, which are unladen in the harbour of Yarmouth. This place is advantageously situated for commerce, particularly to the north of Europe; and lying at the mouths of the rivers Yare, Bure, and Waveney, which are navigable for keels of 40 tons, has ready communications with the interior. Besides fishing smacks, upwards of 300 vessels belong to this port: and its mariners are considered amongst the most able and expert navigators in the kingdom. Yarmouth was early distinguished, and still remains unrivalled, in the herring fishery; and the trade affords subsistence to about 6000 persons, besides those who carry the fish to foreign markets. The boats are large decked vessels, from 40 to 50 tons burden. Yarmouth has also a considerable coal trade. The first mention of Yarmouth is in Domesday-book, whence we may infer that it originated in the early part of the Anglo-Saxon dynasty. About the year 1040, the northern channel of the Yare began to be obstructed by sand, which induced the inhabitants to move their dwellings towards the southern branch of the river. The town quickly increased from the influx of foreigners, who came to this mart for the sale and purchase of fish; and in process of time it became the most flourishing seaport town on this part of the English coast. In 1285, walls were begun to be erected, and the place was surrounded by a moat. Other works were afterwards added, when the country was threatened with invasion by the Spanish armada. The modern defence of Yarmouth is by three forts, which were erected on the verge of the beach, during the American war, and mounted with 32-pounders. The harbour also is defended by two bastions of a mural construction, with two smaller bastions, one at the extremity of the denes or sands, and the other on an elevated spot on the opposite side of the water. Barracks, capable of containing 1000 men, are built on the beach; and an armoury has lately been erected, under the direction of Mr. Wyatt. This building stands on the western side of the town, and is calculated to contain 10,000 stand of arms, besides a large assemblage of naval stores. Among the peculiarities of this place is the use of a low narrow cart drawn by a single horse, and well adapted for the conveying of goods through the narrow lanes of this town;

Vol. XXIV. No. 1671.

but others, on the same construction, more elegantly made, are let for airing to the neighbourhood, and are called Yarmouth coaches; but on passing the sands they have more the appearance of sledges. This is a very uneasy conveyance over the rough pavement of the streets. A sessions is annually held here in the month of September, for the trial of offences committed within the jurisdiction of the corporation. They have also a court of admiralty, for the protection of marine property; and a court for the recovery of debts above 2*l.* and under 10*l.*, from the award of which there is no appeal. The corporation consists of a mayor, 18 aldermen, a recorder, and 36 common council-men; and it returns two members to parliament, chosen by the burgesses at large: the returning officer is the mayor. Here are two banks. Market on Saturday, well supplied, and a small one on Wednesday. Its fairs are the Friday and Saturday in Easter week; 22 miles east-by-south of Norwich and 124 north-east of London. Population nearly 18,000.

YARMOUTH, or SOUTH YARMOUTH, a small seaport, borough, and parish of England, situated on the north-western part of the Isle of Wight, Southamptonshire. It stands on a bank sloping towards the sea, and bears traces of having been formerly of greater extent than at present, its three churches being dwindled into one, though it is defended by a castle with a garrison. It has a quay, where small vessels can load and unload; and the place contains a few genteel houses, and has a neat market-house, with a hall over it. This town sends two members to parliament, who are chosen by the corporation. Market on Friday; 8 miles north-north-west of Newport, and 99 south-west of London. Population 427.—2. A seaport of the United States, in Barnstable county, Massachusetts; 20 miles south-south-east of Boston. Population 2134.—3. A town on the west coast of Nova Scotia; 35 miles west of Shelburn.

YARMUC, or YARUN, a village of Palestine, in the district of Saphet, on a small river of the same name, which falls into the lake of Tiberias; 24 miles south-east of Saphet.

YARMUC, a river of Syria, the ancient *Marsyas*, which runs into the Orontes, near Apamea.

YARN, *s.* [ȝearn, Saxon; the past participle of ȝȳpan, to prepare, to make ready. *H. Tuoke.*] Spun wool; woollen thread.—The web of our life is of a mingled yarn, good and ill together; our virtues would be proud, if our faults whipt them not; and our crimes would despair, if they were not cherished by our virtues. *Shakspeare.*

Spare me but one small portion of the twine,
And let the sisters cut below your line:
The rest among the rubbish may they sweep,
Or add it to the yarn of some old miser's heap. *Dryden.*

YARNESCOMBE, a parish of England, in Devonshire; 6 miles north-east of Great Torrington.

YARNFIELD, a hamlet of England, in Somersetshire; 8 miles east-north-east of Bruton.

YARNTON, a parish of England, in Oxfordshire; 4 miles north-west of Oxford.

YAROCALLA, a settlement of Peru, in the province of Caxatambo.

YARPOLE, a township of England, in Herefordshire; 5 miles from Leominster.

To YARR, *v. n.* [from the sound, *hirrio*, Lat.] To growl, or snarl like a dog. *Ainsworth.*

YARROW, *s.* [*millefolium*, Lat.] A plant.—The yarrow, wherewith he stops the wound-made gore. *Drayton.*

YARROW, a parish of Scotland, in Selkirkshire, about 18 miles in length, and 16 in breadth. Population 1225.

YARROW, a celebrated pastoral stream of Scotland, in Selkirkshire, which rises at a place called Yarrow Cleugh, very near the source of Moffat water; and running east a few miles, forms a beautiful lake called the loch of the Lows, which discharges its waters, after a course of 100 yards, into St. Mary's loch, from which it issues; and, after a course of about 16 miles through the ancient district of Etterick forest, joins its waters to the Etterick, two miles above Selkirk.

Near Newark castle, it forms highly romantic and picturesque scenery. The "Braes of Yarrow" are celebrated in a very beautiful Scottish song.

YARROW, a hamlet of England, in the parish of Mark, Somersetshire.

YARUBA, a small river of Brazil, which runs east, and enters the Madera.

YARUNCAI, a river of Quito, in the province of Cuença, which passes near the city of Quito.

YARUQUI, a settlement of Quito, in Lat. 10. 7. S.

YARUQUIES, a settlement of Quito, in the province of Riobamba.

YARUSE, a settlement of Quito, in the province of Jaen de Bracamoros, which rises in the mountains of Loxa, runs from north to south, and enters the Santiago.

YARWELL, a parish of England, in Northamptonshire, near Wandsford.

YASOR, a parish of England, in Herefordshire; 5 miles south of Weobley.

YATA PRIMERO, a river of Quito, in the province of Moxos, which has its rise in a lake, and running north, and then east, with a winding course, enters the Madera.

YATA, another river in the same province and government. It has the same origin as the former river, runs parallel to it, and enters also the Madera, towards the side where that river is entered by the Beni.

YATAPIRI, a river of Brazil, which runs west, and enters the Parime, between the rivers Jocota and Janabini.

YATCHING, a town of China, of the third rank, in Fokien.

YATE, *s.* [*æat*, Sax.] Still our northern word for *gate*; pronounced *yet*, or *yat*.—Spar the *yate* fast. *Spenser*.

YATE, a parish of England, in Gloucestershire. Population 717.—2. A township in Lancashire, near Blackburn.

YATE'S RIVER, a small river of Western Africa, which falls into the Atlantic. Lat. 8. 8. N. long. 12. 15. W.

YATEHOUSE, a township of England, in Cheshire; 1½ mile north of Middlewich.

YATELEY, a hamlet of England, in Southamptonshire; 3½ miles north-east of Hartford Bridge. Population 560.

YATESBURY, a parish of England, in Wiltshire; 4 miles east-by-north of Calne.

YATHKIED, a lake of North America. Lat. 63. 10. N. long. 98. W.

YATI, the priesthood of the extensive sect of Jaina, in India. A *yati* is sometimes said to be more properly an ascetic, for it doth not appear that he performs any religious rite. It is his duty to read and expound to his disciples the scriptures of the Jaina system.

YATI, a settlement of New Granada, in the province of Carthagená, on the shore of the river Cauca.

YATTENDON, a parish of England, in Berkshire; 6 miles south-east of East Ilsley.

YATTON, a township of England, in Herefordshire; 6 miles north-east of Ross.—2. A parish in Somersetshire; 8 miles north of Axbridge. Population 1215.

YATTON, KEYNELL, a parish of England, in Wiltshire.

YAUARAYA, a small river of Brazil, in the province of Seara, which runs north between the rivers Jacunda and Pacajas, and enters the Amazons, in the arm formed by the island of Marajo.

YAVARI, an island in the river Amazons.

YAUCA, a settlement of Peru, in the province of Camana.

YAVEIRI, a river of Peru, in the province of Chaco.

YAVERLAND, a parish of England, in the Isle of Wight; 8 miles from Newport.

YAVI, a settlement of the viceroyalty of Buenos Ayres, in the province of Tucuman.

YAVINCAN, a settlement of Peru, in the province of Caxamarca.

YAVIZA, a settlement of the province of Darien, on the shore of the river Tuira.

YAULI, a settlement of Peru, in the province of Huarochiri.

YAULY, a town of Hindostan, province of Berar, belonging to the Nagpore rajah. Lat. 20. 25. N. long. 79. 1. E.

YAURI, a settlement of Peru, in the province of Canes and Canches.

YAURISQUE, a settlement of Peru, in the province of Chilques and Masques.

YAUTEPEC, a settlement of Mexico, in the intendency of Mexico, containing 150 families of Spaniards, and 223 of Indians.

YAUYOS, a province of Peru, bounded north and north-west by the province of Guarochiri, east by those of Xauxa and Angaraes, south-west and south by that of Castro Virreyna, and west by that of Canete. Its length is 34 leagues from north to south, and its width 38 from east to west. It is one of the provinces of the most unequal and craggy territory in the whole kingdom, and is extremely cold, with the exception of one or other ravine; its mountains being always covered with snow. They feed many of the vicunna and huanacos, or Peruvian sheep; and in the ravines are found deer and mountain-cats, and some cattle; and of the skins of these the Indians make woven stuffs, which they barter on the coast, taking in exchange grain for their subsistence, the crops here being extremely small. It is only in those parts that are less cold, that various mines have been discovered; but very few of them have been worked, the advantages not covering the expense of the labour. It has many streams, which, united, flow down to the coast, and form the rivers which water the province of Canete.

YAW, *s.* The unsteady motion which a ship makes in a great swell, when, in steering, she inclines to the right or left of her course. *Gifford's Massinger*.

YAUL, or **YAWL**, *s.* A little vessel belonging to a ship, for convenience of passing to and from it.—There were about twenty thousand barges or *yauls* of different kinds upon the water. *Drummond*.

To **YAWL**, *v. n.* [See **To YELL**.] To cry out.

There hideous Scyllas *yawling* round about,
There serpents hiss.

Fairfax.

To **YAWN**, *v. n.* [*æonan*, Saxon.] To gape; to oscillate; to have the mouth opened involuntarily by fumes, as in sleepiness.

The sad-ey'd justice, with his surly hum,
Delivering o'er to executors pale

The lazy, *yawning* drone.

Shakspeare.

In *yawning*, the inner parchment of the ear is extended.—When a man *yawneth*, he cannot hear so well. *Bacon*.—To open wide.

The gashes,

That bloodily did *yawn* upon his face.

Shakspeare.

'Tis now the very witching time of night,

When churchyards *yawn*.

Shakspeare.

To express desire by yawning.—The chiefest thing at which lay-reformers *yawn*, is, that the clergy may, through conformity in condition, be poor as the apostles were. In which one circumstance, if they imagine so great perfection, they must think that church which hath such store of mendicant friars, a church in that respect most happy. *Hooker*.

YAWN, *s.* Oscitation.

Thee, Paridel, she mark'd thee; there
Stretch'd on the rack of a too easy chair;

And heard thy everlasting *yawn* confess

The pains and penalties of idleness.

Pope.

Gape; hiatus.

Hence to the borders of the marsh they go,
That mingles with the baleful streams below;
And sometimes with a mighty *yawn*, 'tis said,
Opens a dismal passage to the dead,
Who, pale with fear, the rending earth survey,
And startle at the sudden flash of day.

Addison.

YAWNING,

YA'WNING, *adj.* Sleepy; slumbering.

Ere to black Hecat's summons
The shard-born beetle, with his drowsy hums,
Hath rung night's yawning peal, there shall be done
A deed of dreadful note. *Shakspeare.*

YAXHAM, a parish of England, in Norfolk. Population 468.

YAXLEY, a small but neat town of England, in the county of Huntingdon. It is situated near the river Nen, in the fenny country, but on a fine gravelly eminence, commanding a beautiful view of the surrounding country. It is in general well built, and has a handsome Gothic church, with a lofty spire. Barracks were erected here on a very liberal and excellent plan, for the security of French prisoners, who were confined here during the late war: they are capable of containing 7000 or 8000 men. The market, which was on Wednesday, is now disused; but there is still a fair on Holy Thursday; 2 miles north-east of Stilton, and 73 north-by-west of London. Population 1391.

YAXLEY, a parish of England, in Suffolk; 1½ mile west-by-north of Eye.

YAYNANGHEOM, a town of the Birman empire, situated on the eastern bank of the Irrawaddy river. Its only manufacture is earthen pots, but it carries on a very considerable traffic. Five miles east of this town are situated the celebrated petroleum wells, which supply the whole of this kingdom with that useful production of nature. The government farm out the ground that supplies this extraordinary oil, and the renter digs the well, and draws it at his own risk and expense. It is used for lamps, and all the other purposes of wood or train oil, and is sold very cheap. Lat. 20. 28. N. long. 94. 35. E.

YAZEC, a small river of Brazil, which runs north, between the rivers Gorbai and Yutay, and enters the Amazons.

YAZECHÉ, a settlement of Mexico, in the district of Villalta; 300 miles from Mexico.

YAZER, a parish of England, in Herefordshire; 8½ miles from Hereford.

YAZONA, a settlement of New Spain, in the district of Villalta, containing 190 Indian families; 300 miles from Mexico.

YAZOO, or YASOO RIVER, in Georgia West Territory, consists of three large branches, which united, pursue a south-west course a few miles, and the confluent stream enters the east bank of the Mississippi, by a mouth upwards of 100 yards wide; according to Mr. Gauld, in Lat. 32. 37. N.; and by Mr. Purcell in 32. 38. N.

YAZU, a settlement of Peru, in the province of Canta.

YBAICHALVAL, a river in the north-east of Spain, which falls into the Bay of Biscay.

YBICUY, a parish of Paraguay, about 55 miles south-east of Assumption. Lat. 26. 0. S. long. 57. 1. W.

YBITIMIRI, a parish of Paraguay. Lat. 25. 45. S. long. 56. 53. W.

YCAQUE, the north point of the bay of Mancenilla, in the island of St. Domingo.

YCHLAWRCOED, a parish of England, in Monmouthshire, near Newport. Population 632.

YCLA'D, *part. of clad.* Clothed.

Her sight did ravish, but her grace in speech,
Her words *yclad* with wisdom's majesty,
Make me from wond'ring fall to weeping joys. *Shakspeare.*

YCLE/PED. [The participle passive of *clepe*, to call; clepan, Saxon; with the increasing particle *y*, which was used in the old English in the preterites and participles, from the Saxon *ȝe*.] Called; termed; named.

But come, thou goddess, fair and free,
In heaven *yclep'd* Euphrosyne,
And by men, heart-easing mirth. *Milton.*

YDRA'D, *part. pass. of to dread.*—Yet nothing did he dread, but ever was *ydrad*. *Spenser.*

YE. The nominative plural of *thou*.—Ye are they which justify yourselves. *St. Luke.*

YE, a town of China, of the third rank, in Honan.

YEA, *adv.* [ea, or *ȝea*, Saxon; *ja*, Danish, German, and Dutch.] Yes. A particle of affirmation; meaning, it is so, or is it so?—*Yea*, hath God said, ye shall not eat of every tree in the garden. *Genesis.*—Let your conversation be *yea*, *yea*; nay, nay. *St. Matt.*

Why do disputes in wrangling spend the day?
Whilst one says only *yea*, and t'other nay. *Denham.*

A particle by which the sense is intended or enforced: not only so, but more than so.—I am weary; *yea*, my memory is tir'd. *Shakspeare.*—From these Philippinæ are brought costly spices, *yea*, and gold too. *Abbot.*—All the promises of God are *yea*, and amen; that is, are verified, which is the importance of *yea*, and confirmed, which is meant by amen, into an immutability. *Hammond.*

YEACOS, PUNTA DE, or POINT JACKS, a cape on the north coast of the island of Cuba. Lat. 23. 29. N. long. 80. 25. W.

YEACOS, PUNTA DE, a cape on the south of the island of Cuba. Lat. 19. 59. N. long. 78. 51. W.

To YEAD, or YEDE, *v. n.* preterite *yode*. [This word seems to have been corruptly formed from *ȝeob*, the Saxon preterite of *ȝan*.] To go; to march. *Obsolete.*

They wander at will, and stay at pleasure,
And to their folds *yeade* at their own leisure. *Spenser.*

Then bad the knight this lady *yede* aloof,
And to an hill herself withdraw aside,

From whence she might behold that battle's proof,
And eke be safe from danger far descry'd. *Spenser.*

Yet for she *yode* thereat half aghast,
And Kiddy the door sparred after her fast. *Spenser.*

That same mighty man of God,
That bloud red billows like a walled front,
On either side disparted with his rod,
Till that his army dry-foot through them *yod*. *Spenser.*

YEADON, a township of England, West Riding of Yorkshire; 6 miles north-north-east of Bradford. Population 1954.

YEALMTON, or YALMTON, a parish of England, in Devonshire; 4 miles south-east of Plympton Earls. Population 1051.

To YEAN, *v. n.* [eanian, Saxon.] To bring young. Used of sheep.

This I scarcely drag along,
Who *yeaning* on the rocks has left her young. *Dryden.*

YE'ANED, *part. adj.* Brought forth as a lamb.
I love thee better than the careful ewe
The new *yean'd* lamb. *Fletcher.*

YE'ANLING, *s.* The young of sheep.
All the *yeanlings* which were streak'd and pied,
Should fall as Jacob's hire. *Shakspeare.*

YEANSTON, a hamlet of England, in the parish of Henstridge, Somersetshire.

YEAR, *s.* [ȝeap, Sax.] If one by the word *year* mean twelve months of thirty days each, i. e. three hundred and sixty days; another intend a solar *year* of three hundred sixty-five days; and a third mean a lunar *year*, or twelve lunar months, i. e. three hundred fifty-four days, there will be a great variation and error in their account of things, unless they are well apprized of each other's meaning. *Watts.*

With the *year*
Seasons return, but not to me returns
Day, or the sweet approach of even or morn. *Milton.*

It is often used plurally, without a plural termination.—I fight not once in forty *year*. *Shakspeare.*—In the plural, old age.

Some mumble-news,
That smiles his cheek in *years*, and knows the trick
To make my lady laugh when she's dispos'd,
Told our intents. *Shakspeare.*

YE'ARBOOK, *s.* The reports from the reign of king Edward the Second inclusive to that of Henry the Eighth, were

were taken by prothonotaries or chief scribes of the court, at the expense of the crown, and published annually; whence they are known under the denomination of the *yearbooks*. *Blackstone*.—The students of common law, by reading their *yearbooks*, recover the experience of former ages. *Wotton*.

YEARDSLEY, a hamlet of England, in Cheshire; 9 miles south-east of Stockport.

YEARED, *adj.* Containing years; numbering years.

Both were of best feature, of high race,
Year'd but to thirty.

B. Jonson.

YE'ARLING, *adj.* Being a year old.

A *yearling* bullock to thy name shall smoke;
Untam'd, unconscious of the galling yoke.

Pope.

YE'ARLY, *adj.* Annual; happening every year; lasting a year.

The *yearly* course that brings this day about,
Shall never see it but a holiday.

Shakspeare.

YE'ARLY, *adv.* Annually; once a year.

Not numerous are our joys, when life is new,
And *yearly* some are falling of the few.

Young.

To YEARN, *v. n.* [*γάρναι*, *geornian*, Sax.] To feel great internal uneasiness. In Spenser it is sometimes *earn*. It is by Spenser used for desire, or the pain of longing: it now implies tenderness or pity.

He despis'd to tread in due degree,
But chaff'd, and foam'd, with courage fierce and stern,
And to be eas'd of that base burden still did *yearn*. *Spenser.*

Unmov'd the mind of Ithacus remain'd;

But Anticlus, unable to controul,

Spoke loud the language of his *yearning* soul.

Pope.

To YEARN, *v. a.* To grieve; to vex.

I am not covetous of gold,

It *yearns* me not if men my garments wear. *Shakspeare.*

YE'ARNFUL, *adj.* Mournful. *Obsolete.*—

Oh musicke, as in joyfull tunes thy mery notes I did borow,
So now lend me thy *yearnfull* tunes, to utter my sorrow.

Damon and Pith.

YE'ARNING, *s.* Act or state of being moved with pity or tenderness.—At beholding the miseries of others, they find such *yearnings* in their bowels, and such sensible commotions raised in their breasts, as they can by no means satisfy. *Calamy.*

YEARSLEY, a township of England, in Yorkshire; 6½ miles south-south-west of Helmsley.

YEAST. See *YEST*.

YEAWELEY, a township of England, in Derbyshire; 4½ miles south of Ashborne.

YEAVINGING, a hamlet of England, in Northumberland; 3 miles north-west of Wooler.

YEBINETO, a small river of Quito, in the province of Mainas, which runs east, and enters the Urquicia.

YECLA, a town of Spain, in Murcia, with 2200 inhabitants; 14 miles west-by-north of Villena.

YECUDAHUE, a small river of Chili, in the province of Maule, which runs north, and enters the Tabolebo.

YEDDINGHAM, a parish of England, in Yorkshire; 9½ miles north-east of New Malton.

YEEHA, a town of Abyssinia, where there are the remains of a very large and ancient convent, called Abba Asfe.

YEGUADA, a river of St. Domingo, which runs to the north coast of the great bay of Samana, where it enters the sea.

YELAMBO, a settlement of New Granada, in the province of Antioquia, on the shore of the Magdalena.

YELCUNDEL, a district of Hindostan, province of Hyderabad. It is situated between the 18th and 19th degrees of northern latitude, and bounded on the north by the river Godavery.

YELDERSLEY, a hamlet of England, in Derbyshire; 3 miles east-south-east of Ashborne.

YELDHAM, GREAT, a parish of England, in Essex; 3 miles north-west of Castle Hedingham. Population 437.

YELDHAM, LITTLE, another parish in Essex, one mile from the foregoing.

YELFORD, a township of England, in Oxfordshire; 3½ miles south of Witney.

YELK, *s.* [from *zealepe*, *yellow*, Sax.] The yellow part of the egg. It is commonly pronounced, and often written *yolk*.—That a chicken is formed out of the *yolk* of the egg, with some antient philosophers the people still opinion. *Brown.*

All the feather'd kind,

From th'included *yolk*, not ambient white arose. *Dryden.*

To YELL, *v. n.* [*γύλλαν*, Sax.; *yla*, Su. Goth. and Icel.; *πλαω*, Greek; *ululo*, Lat.] To cry out with horror and agony.

Yelling monsters, that with ceaseless cry
Surround me.

Milton.

Night-struck fancy dreams the *yelling* ghost.

Thomson.

To YELL, *v. a.* To utter with a yell.

Each new morn,

New widows howl, new orphans cry; new sorrows
Strike heaven on the face, that it resounds,
As if it felt with Scotland, and *yell'd* out
Like syllables of dolour.

Shakspeare.

YELL, *s.* A cry of horror.

With like timorous accent and dire *yell*,
As when, by night and negligence, the fire
Is spread in populous cities.

Shakspeare.

YELL, or ZELL, one of the most northerly of the Shetland isles, is about 20 miles long and 12 broad. The coast is bold and rocky, intersected by several bays or *voes*, which form safe harbours: the chief of these are called Hamna-voe, Bura-voe, and Mid Yell-voe. The surface is pretty level, with several small lakes, which are the sources of a few rivulets. The only arable land is on the coast; the interior affording a coarse pasture for sheep. There are several extensive peat mosses, in which are found large trees, though scarce a shrub is now to be seen. It is divided into two parishes, viz. North Yell, united to the island of Fetlar, in forming a parochial district, and the united parishes of Mid and South Yell. Population of the parishes of Mid and South Yell, is 1594.

YELL, NORTH, a parish of Shetland, in the island of Yell, to which the island of Fetlar is united. North Yell is eight miles in length, and six in breadth; Fetlar is four miles long, and eight and a half in breadth. Population 1434.

YELLAND, CONYERS and REDMAYNE, adjoining townships of England, in Lancashire; about 10 miles from Lancaster.

YELLING, a parish of England, in Huntingdonshire; 5 miles east-north-east of St. Neot's.

YELLISON, a hamlet of England, in the West Riding of Yorkshire.

YE'LLOW, *adj.* [*zealep*, Saxon; *gheleuwe*, Dutch; *giallo*, Ital.] Being of a bright glaring colour, as gold.

Negligent of food,

Scarce seen, he wades among the *yellow* broom. *Thomson.*

YE'LLOW, *s.* Yellow colour.—After a lively orange, followed an intense bright and copious *yellow*, which was also the best of all the *yellows*. *Newton.*

To YE'LLOW, *v. a.* To render yellow.

So should my papers, *yellow'd* with their age,
Be scorn'd.

Shakspeare.

To YE'LLOW, *v. n.* To grow yellow.—The opening valleys, and the *yellowing* plains. *Dyer.*

YE'LLOWBOY, *s.* A gold coin. *A very low word.*—John did not starve the cause; there wanted not *yellowboys* to fee council. *Arbutnot.*

YELLOW-

YELLOW-BUSHA, or **YALO-BUSHUR**, an eastern branch of the Yazoo, Mississippi, in the United States. A military station, named Elliot, was established, in 1818, on this river; 120 miles above the mouth of the Yazoo.

YELLOW BREECHES CREEK, a river of the United States, in Pennsylvania, which runs into the Susquehanna. Lat. 40. 13 N. long. 76. 52. W.

YELLOW CREEK, a township of the United States, in Columbiana county, Ohio. Population 491.

YELLOW CREEK, **GREAT** and **LITTLE**, two streams of the United States, in Ohio, which flow into Ohio river in the south-east corner of Columbiana county; four miles apart.

Y'ELLOWGOLDS, *s.* A flower.

Bring too some branches forth of Daphne's hair,
And gladdest myrtle for these posts to wear,
With spikenard weav'd, and marjoram between,
And starr'd with *yellow-golds*, and meadow's-queen.

B. Jonson.

Y'ELLOWHAMMER, *s.* [*cenchrismus bellonii.*] A bird.

Y'ELLOWISH, *adj.* Approaching to yellow.—Although amber be commonly of a *yellowish* colour, yet there is found of it also black, white, brown, green, blue, and purple. *Woodward.*

Y'ELLOWISHNESS, *s.* The quality of approaching to yellow.—Bruised madder, being drenched with the like alcalizate solution, exchanged its *yellowishness* for a redness. *Boyle.*

Y'ELLOWNESS, *s.* The quality of being yellow.—Apples, covered in lime and ashes, were well matured, as appeared in the *yellowness* and sweetness. *Bacon.*—*Yellowness* of the skin and eyes, and a saffron-coloured urine, are signs of an inflammatory disposition of the liver. *Arbutnot.*—It is used in Shakspeare for jealousy.—Ford I will possess with *yellowness.* *Shakspeare.*

YELLOW RIVER, a river of Ireland, in the King's county, which runs into the Boyne; 4 miles south of Kinnegad.

YELLOW RIVER. See **HOANG-HO.**

Y'ELLOWS, *s.* A disease in horses. When the gall-pipe is stopped up, that matter which should be turned into gall is carried back into the blood, and tinctures it yellow; so that the eyes, inside of the lips, slaver, and all the parts of the horse, that are capable of shewing the colour, appear yellow. *Farrier's Dict.*—His horse sped with spavins, and rai'd with the *yellows.* *Shakspeare.*

This disease is incident to horses, neat-cattle, and sheep, in which there is a yellow jaundice-like appearance, especially in the eyes.

It is a disease that takes place in horses in all states of them, but which in those of the young kind is often unaccompanied with fever, or any sort of irritation.

It shews itself by a particular yellowness in the eyes and the inside of the mouth, with a considerable degree of constipation of the bowels in some cases.

The yellows in neat-cattle is a common disease, arising from obstruction in the gall-ducts, and consists in a diffusion of the obstructed bile through the whole body of the animal. It is first distinguished in the white of the eyes, which has a particular yellow appearance; and as it increases, the whole of the skin becomes tinged with the same yellow colour: but the ears, tail, eyes, and mouth, are the parts in which it is the most conspicuous. The animals are affected with great weakness and debility in every stage of the disease, and there is a listlessness, with indisposition to move, and a want of appetite for their food. When in the pastures, they mostly wander about by the sides of the hedges, or other fences, in a lonely manner. Milch-cows are particularly subject to the disease in the spring and at the fall of the year; though they are not exempt from having it at all other seasons. The most unfavourable state of the disease is when it proceeds from an induration of some part of the liver, as there is then but little hope of the disease being permanently removed. As the changing state of the weather has often a great effect in retarding or hastening the removal

VOL. XXIV. No. 1672.

of the disease, care should be taken to house the animals in all unfavourable seasons.

It is not a very common disease among sheep, and consequently has not been very accurately described; but probably confounded with many other affections to which they are subject. It is supposed by some to be in general confined to the South-Down and new Leicester breeds, which, from their more tender constitutions, are more liable to complaints.

The appearances of the disease are a yellowness over the whole body, but particularly distinguishable in the white of the eye. The wool, too, has a little of the tinge, and is slightly hard. The passages of the belly are of a whitish colour, and the urine is found to tinge any thing immersed in it of a yellow hue. Sometimes there is a degree of fullness and hardness in the right side, about the seat of the liver. The causes are any thing which has a tendency to obstruct the gall-ducts, but they are by no means evident; their effect, however, seems generally to harden the liver, and invariably to impede the passage of the bile from it into the bowels. In some cases, small stones, formed in the gall-bladder, produce it; and at other times, it is caused, as in the rot, by the swelling of the glands impeding the flow of the bile in the ducts, in which case it is mostly incurable.

YELLOW SEA. See **GULF OF LEAOTONG.**

YELLOW SPRINGS, springs of the United States, in Greene county, Ohio. They are a curiosity, and are said to possess medicinal qualities. Here is a post office; 9 miles from Xenia.

YELLOWSTONE RIVER, a large river of North America, which falls into the Missouri, about the 47th degree of north latitude. Captains Lewis and Clarke, after ascending the sources of the Missouri, penetrating across the Rocky mountains, and descending the Columbia to the Pacific ocean, agreed, on their return, to take different routes towards the Missouri; and it is to the latter of these enterprising travellers, who descended the Yellowstone to its junction with the Missouri, that we are indebted for the first accurate account of this great river. The Yellowstone river, according to Indian information, has its remote sources in the Rocky mountains, near the peaks of the Rio del Norte, on the confines of New Mexico, to which country there is a good road during the whole distance along the banks of the Yellowstone. Its western waters are probably connected with those of Lewis's river, while the eastern branches approach the heads of Clarke's river, the Bighorn, and the Platte; so that it waters the middle portion of the Rocky mountains for several hundred miles from north-west to south-east. During its whole course from the point at which Captain Clarke reached it to the Missouri, a distance which he computed at 837 miles, this river is large, and navigable for perioques, and even batteaux, there being none of the moving sand-bars which impede the navigation of the Missouri, and only a single ledge of rocks, which, however, is not difficult to pass. Even its tributary waters, the Bighorn, Clarke's fork, and Tongue river, may be ascended in boats for a considerable distance. The banks of the river are low, but bold, and nowhere subject to be overflowed, except for a short distance below the mountains. The predominating colour of the river is a yellowish-brown; that of the Missouri, which possesses more mud, is of a deep drab colour; the bed of the former being chiefly composed of loose pebble; which, however, diminish in size in descending the river, till after passing the Lazeka, the pebble ceases as the river widens, and the mud and sand continue to form the greater part of the bottom. Over these the water flows with a velocity constantly and almost equally decreasing in proportion to its distance from the mountains. From the mountains to Clarke's fork, the current may be estimated at four and a half miles per hour; thence as low as the Bighorn, at three and a half miles; between that and the Lazeka at three miles; and from that river to the Wolf rapid, at two and three-quarter miles; from which to its entrance, the general rapidity is two miles per hour. The appearance and character of the country present

8 K

nearly

nearly similar varieties of fertile, rich, and open lands. Above Clarke's fork, it consists of high, waving plains, bordered by stony hills, partially supplied with pine; the middle portion, as low as the Buffalo shoals, contains less timber, and the number diminishes still lower where the river widens, and the country spreads itself into extensive plains. Like all the branches of the Missouri which penetrate the Rocky mountains, the Yellowstone, and its streams within that district of country beyond Clarke's fork, abound in beaver and otter; a circumstance which strongly recommends the entrance of the latter river as a judicious position for the purposes of trade. After leaving the mountains, the river soon grows deep and navigable, the stream extending to between 200 and 300 feet. The Yellowstone, at its confluence with the Missouri, was measured by Captains Lewis and Clarke, when it was found to contain in a bed of 850 yards wide, 297 yards of water. The deepest part of the channel was 12 feet, and the river had by this time fallen to its summer height. Along its banks are immense herds of elk, buffalo, and deer. Bears also frequently make their appearance, and they are remarkably ferocious. In descending the river, Capt. Clarke and his comrades were dreadfully annoyed by mosquitoes, which abound here, and also on the banks of the Missouri.

To *YELP*, *v. n.* [*gealpan*, Saxon; *yaulp* and *yolp* in our old books.] To bark as a beagle-hound after his prey.—To *yaulpe* and bark like a dog and a fox. *Barret.*

A little herd of England's tim'rous deer,
Maz'd with a *yelping* kennel of French curs. *Shakspeare.*

YELPOORA, a town of the south of India, province of Canara, and district of Soonda. It is inhabited by Christians, Mohometans, and Hindoos. Lat. 14. 57. N. long. 74. 55. E.

YELTES, a river of Spain, in the province of Salamanca, which falls into the Douro.

YELVERTOFT, a parish of England, in Northamptonshire; 9½ miles north-by-east of Daventry. Population 598.

YELVERTON, a parish of England, in Norfolk; 6½ miles south-east of Norwich.

YEMEN, a country of Arabia, forming the south-eastern division of that part of Asia, situated partly upon the Red sea, and partly on the Indian ocean. It was celebrated by the ancients, under the flattering title of the Happy Arabia; which appellation, however, it can merit only in a comparative sense. It is by no means exempted from that curse of aridity under which Arabia generally suffers. The plain of the Tehama, which forms a broad belt along the whole of the coast, consists almost entirely of a waste of unproductive sand. The Djebel, or mountainous district in the interior, presents in many parts a more agreeable aspect. Its lower declivities are covered with trees and aromatic shrubs; and the mountain chains are divided by fine vallies, which being watered by numerous streams, can be advantageously cultivated. Although the instruments employed be rude, yet the natives of Yemen display a greater measure of agricultural industry than most of their neighbours; in many districts the fields are cultivated like gardens. The grains chiefly raised are barley, millet, and dhourra; the supply of water being insufficient for the culture of rice. The most valuable and celebrated products of this region consist of the aromatic plants which grow upon the sides of the hills. The coffee of Yemen has always possessed a flavour which that of no other part of the world can rival. Europe, indeed, is now chiefly supplied from the West Indies; but in the east, the coffee of Mocha is always eagerly sought after. It is remarkable, that this plant, so prized over the rest of the world, is despised in its native spot; an infusion of the husks being the only form in which it is used. The balm of Mecca, and the tree bearing incense, are also the products of Yemen, though not in equal perfection as on the opposite African coast.

Yemen is one of the few parts of Arabia which have been formed into a considerable and monarchical state. It is subject to a sovereign, who assumes the modest title of Imam, or doctor, but exercises over his subjects an authority nearly absolute. He is obliged, however, to respect the pride of the

Schiechs, or hereditary chiefs, who here, as over all Arabia, possess high influence, and, seated in their castles in the recesses of the Djebel, often set his mandates at defiance. His authority is most complete in the towns, which he governs by an officer, called a Dola. In Niebuhr's time, the Imam maintained an army of 4000 foot and 1000 horse, and enjoyed a revenue of about 90,000*l.* The sovereigns of Yemen were formerly reduced to vassalage; first, under the Saracen power, and then under the soldans of Egypt. For more than a century they have been independent on that side; but they are in danger of being swallowed up by the growing power of the Wahabees. The sheriffe of Abu Arisch is now master of all the sea-ports of Yemen, except Mocha, whose walls are sufficient to baffle armies composed solely of cavalry.

The principal cities of Yemen are, in the interior, Sana, the capital, and Taas; on the coast, Mocha and Aden. The former place carries on almost all the trade of this part of Arabia, which will accordingly be found described under the head of **MOCHA**.

YEMI, a small river of South America, which enters the Amazons opposite to the settlement of San Pablo de los Omasguas.

YEN, a river of China, which falls into the Hoangho; 17 miles south-east of Yentchang.

YEN-CHAN, a town of China, of the third rank, in Pechele.

YEN-CHI, a town of China, of the third rank, in Honan.

YEN-CHIN-CHING, a town of China, of the third rank, in Shantung.

YENDON, a river of England, in Staffordshire, which falls into the Churnet at Chettleton.

YENGI, a town of Coréa; 25 miles north-east of Kang.

YENITE, a mineral found in the island of Corsica, which from the great quantity of iron that it contains might properly be classed with the ores of iron. It is arranged by professor Jameson with the chrysolite family, but it differs greatly in the proportions of its constituent parts from all the other species which he has classed with this family. The appearance of this mineral resembles hornblende, or rather black epidote: it occurs both crystallized and massive. The form of the crystals is that of a rhomboidal prism, the alternate angles of which measure about 113 and 67 degrees: the prisms are terminated by low four-sided pyramids, the faces of which are set on the lateral plains of the prism. It is also crystallized in rectangular prisms, bevelled on the extremities, and the bevelling planes set on the obtuse edges. These figures are also variously modified by the edges or angles being bevelled. The crystals are sometimes very minute or acicular, and sometimes half an inch in thickness; they are frequently aggregated in diverging radii, and sometimes imbedded. The prisms are striated longitudinally. The structure is imperfectly lamellar, with joints parallel to the sides, and to the short diagonal of the rhomboidal prism. The fracture of yenite is uneven, and imperfectly conchoidal, with a lustre between vitreous and resinous. The colour is black passing into brown; it does not change its colour in the streak. The hardness of yenite is about equal to that of common felspar; it is easily frangible.

YEN-KING, a city of China, of the second rank, in Pechele. Lat. 40. 30. N. long. 125. 30. E.

YEN-LI, a town of China, of the third rank, in Houquang.

YEN-LIN, a town of China, of the third rank, in Honan.

YENNE, a town of Savoy, on the Rhone; 11 miles north-west of Chamberry. Population 2800.

YEN-NGAN, a city of China, of the first rank, in Chan-si, situated in an agreeable plain, surrounded by lofty mountains. The territory abounds in sables, martins, and other fur-bearing animals. Lat. 36. 44. N. long. 108. 49. E.

YEN-PING, a city of China, of the first rank, in Fokien. It is situated on the declivity of a hill, at whose foot runs the river Min-ho. Though not very large, it is considered a fine city; and almost all the trade of the province is seen passing and repassing under its walls. Lat. 26. 40. N. long. 117. 54. E.

YEN-TCHANG,

YEN-TCHANG, a town of China, of the third rank, in Chan-si.

YEN-TCHEOU, a city of China, of the first rank, in Tchekiang. It is situated on a river, so near the sea, that the tide comes up to its walls; and the beauty of its buildings is such as has obtained for it the title of Little Hangtchoofou. In its vicinity are mines of copper, and also trees, that yield the varnish of which is formed the lacquered work, so much esteemed in Europe. The paper manufactured there is also much esteemed.

YEN-TCHEOU, a city of China, of the first rank, in Shantung. Its territory is one of the finest in China, being inclosed between the Hoangho and another great river, and watered by numerous streams that fall into them. Among its dependent cities there are several that are little inferior to itself. The territory is also celebrated as containing the birth-place of Confucius. Lat. 35. 44. N. long. 116. 36. E.

YEN-TCHIN, a town of China, of the third rank, in Shantung.

YEN-TCHING, a town of China, of the third rank, in Kiangnan.—2. A town of China, of the third rank, in Honan.—3. A town of China, in Shantung, where a species of glass is manufactured, so peculiarly delicate, that it will not endure the inclemency of the air.

YEN-TCHUEN, a town of China, of the third rank, in Chan-si.

YEN-TING, a town of China, of the third rank, in Se-chuen.

YEO'MAN, *s.* [From the Sax. *ȝuma*, Theotisc. *gomman*, a man. *Serenius*.]—A man of a small estate in land; a farmer; a gentleman farmer.—Gentlemen should use their children as the honest farmers and substantial *yeomen* do theirs. *Locke*.—It seems to have been anciently a kind of ceremonious title given to soldiers: whence we have still *yeomen* of the guard.

Tall *yeomen* seemed they, and of great might,
And were enraged ready still for fight. *Spenser.*

You, good *yeomen*,
Whose limbs were made in England, shew us here
The mettle of your pasture. *Shakespeare.*

It was also a freeholder not advanced to the rank of a gentleman.

His grandfather was Lionel duke of Clarence,
Third son to the third Edward, king of England:
Spring crestless *yeomen* from so deep a root? *Shakespeare.*

It seems to have had likewise the notion of a gentleman servant.

A jolly *yeoman*, marshal of the hall,
Whose name was appetite, he did bestow
Both guests and meats. *Spenser.*

It is the first or highest degree among the plebeians of England; next in order to the gentry.

The yeomen are properly the freeholders, who have land of their own; so called from the Saxon *gemane*, or *geman*, common.

According to sir Thomas Smith, a yeoman is a free-born Englishman, who can lay out of his own free land in yearly revenue to the sum of forty shillings sterling.

The yeomanry of England are capable of holding lands of their own to a good value; are adjudged capable of certain offices, as constables, churchwardens, jurymen; and are also to vote in elections to parliament, and to serve in the army, and to do any other act where the law requires one that is *probus et legalis homo*.

The yeomen were famous, in ancient times, for military valour, being particularly expert at the management of the bow; whence the infantry was composed chiefly of them.

They frequently constituted the body-guard of our kings; and in process of Time gave rise to the institution of yeomen of the guard.

By a statute, 2 Hen. IV., it is enacted, that no yeoman shall take or wear a livery of any lord, upon pain of imprisonment, and a fine at the king's pleasure.

Yeoman is also a title of office in the king's household, of a middle place or rank between a gentleman and a groom. Such are the yeoman of the buttery; yeomen of the scullery; yeomen of the wine-cellar, ewry, wood-yard, &c. There are also the yeoman of the mouth, yeoman of the kitchen, yeomen-porters, &c.

YEOMEN of the Guard, properly called yeomen of the guard of the king's body, were anciently a body of men of the best rank under gentry, and of larger stature than ordinary; every one being required to be six feet high.

Their number has varied in almost every reign, and formerly consisted of a certain number in ordinary, and an indefinite number extraordinary; and in case of a vacancy in the former, it was supplied out of the latter number. In the reign of king Edward VI. this corps was very numerous. In the reign of queen Elizabeth, the yeomen attending her in her different progresses were occasionally mounted. In the reign of queen Anne, the arms of half this band were arquebuses, which are said by Chamberlain to have been disused ever since the reign of king William; the other half had partisans, and those of both classes had swords. They had their wages and diet allowed them; so that in a MS. of the expenses of the royal establishment for the year 1727, the charges of the table of the yeomen of the guard were 273*l.* 15*s.* But their diet has been discontinued since that reign; Their duty was to wait upon the queen in her standing-houses; forty by day, and twenty by night. At St. James's, they waited in the first room above stairs, called the guard-chamber. It is also their duty to attend the sovereign abroad by land or water.

At present there are but one hundred yeomen in constant duty, at 39*l.* 11*s.* 3*d.* per annum each; eight of whom are called ushers, who have 10*l.* per annum each more than the other yeomen; six are called yeomen hangers, and two yeomen bed-goers, who have the same pay as the ushers; and seventy more not on duty; and as one of the hundred dies, his place is supplied out of the seventy.

The officers are, a captain, who has 1000*l.* per annum; a lieutenant, at 500*l.* per annum; an ensign, at 300*l.*; and four exons, at 150*l.* per annum each; and a clerk of the checque at the same salary.

YEO'MANLY, *adj.* Of or belonging to a yeoman.—It would make him melancholy to see his *yeomanly* father cut his neighbours' throats, to make his son a gentleman! *B. Jonson*.—His [Selden's] father was a *yeomanly* man. *Aubrey*.

YEO'MANRY, *s.* The collective body of yeomen.—This did amortize a great part of the lands of the kingdom unto the hold and occupation of the *yeomanry*, or middle people, of a condition between gentlemen and cottagers. *Bacon*.

YEOMANRY CAVALRY, a denomination given to those troops of horse which were levied in the late war among the gentlemen and yeomen of the country, upon the same principle with the volunteer companies. The yeomanry cavalry were to be allowed pay when called out on actual service, and each corps was liable to be put upon duty within its district: all contingent expenses, properly and unavoidably incurred, were to be reimbursed after an investigation at the war office. One serjeant and a trumpeter *per* troop were to have constant pay, with the same allowances as serjeants and trumpeters of regular cavalry. Some accoutrements were to be furnished by the ordnance, or an equivalent in money to be given in lieu of them, and 1*s.* 2*d.* per man for holsters.

YEOU, a town of China, of the third rank, in Houquang.

YEOU-NHING, a town of China, of the third rank, in Kiangnan.

YEOVERLEY, a township of England, in Derbyshire; 4 miles from Ashborne.

YEOVERIN, a small village of England, in Northumberland, near Wooler.

YEOVIL, a market town of England, in the county of Somerset. It consists of upwards of 20 streets and lanes: some of the former are wide and open. The buildings have been much increased, both in the suburbs and within the town

town itself, in the course of the last ten years. The houses are in general good, and many of them are built of free-stone. It has an alms-house, under the governance of a custos and two wardens, chosen annually from the trustees, founded for the benefit of twelve poor persons of either sex, by William Woburne, of London, a minor canon of St. Paul's, who endowed it with an estate situate at Okeford Fitzpane, in the county of Dorset, and built a chapel for the use of the alms-people, in which he ordained divine service to be performed every day. Its revenues have also been considerably increased by the bequests of different benefactors. The church of Yeovil is a handsome old building, of the lighter Gothic order, and is dedicated to St. John the Baptist. It consists of a nave, a large chancel, north and south side aisles, and a transept, all of which are covered with lead. The length of the whole is 146 feet, and the breadth 50: the transept measures 80 feet. At the west end of this church there is a large plain tower, the architecture of which corresponds with the generality of those within this county, which were built in the reign of Henry VI. It is 90 feet in height, and has a stone balustrade on the top. It contains a clock, and eight remarkably fine bells. The altar-piece is handsome; it forms a portico, supported by fluted pillars, surmounted by Corinthian capitals, with a rich entablature. Under the floor of the altar is a perfect crypt, formerly used as a vestry, but now rarely noticed. Four spacious galleries have been lately added to this church, two of which are solely appropriated for the use of the poor; and they have been so judiciously erected, as not to detract from the general appearance of the building. There is a well endowed free-school in this town; and there are several private institutions, established for the education and support of the poor, which are supported by the contributions of the inhabitants. There are four meetings for dissenters of different denominations, and also one for the society of Friends. The market-house is an extensive open building, supported by two rows of stone pillars. There are also rows of butchers' shambles. The market on Fridays is very considerable for all kinds of stock and provisions, and is a great resort for persons concerned in the flax trade. The town was formerly noted for its manufacture of woollen cloth, but its principal mart now is that of ladies' gloves, in which particular branch it exceeds any other place in the kingdom. It has a corporation, governed by a portreeve, who is chosen annually by the lord of the manor of the borough of Yeovil, from amongst the burgesses. The corporation exercises no jurisdiction beyond the management of its own funds. An alms-house for the support of four aged females, is attached to it. The town is well supplied with water, and the country around it is rich and pleasantly diversified. The fairs are held on the 28th of June, and 17th of November. Nine miles south-south-east of Somerton, and about 122 west-south-west of London. Population in 1811, 3118.

YEOVILTON, a parish of England, in Somersetshire; 2 miles east of Ilchester.

YEOWAH, a town of the Birman empire, situated on the west bank of the Irrawaddy river. Lat. 20. 55. N. long. 94. 30. E.

YEPES, a small town of the interior of Spain, in New Castile; 21 miles east of Toledo.

YERABUENA, a port of Chili, in the province of Coquimbo, formed in part by a long strip of land of the same name.—Also a port of Peru, in the province of Arica. Lat. 17. 35. N.

YERBAL, a small river of South America, in the viceroyalty of Buenos Ayres, which runs south, and enters the Rio Negro.

YERES, the name of two small rivers of France. The one rises in the department of the Seine and Marne, and flows into the Seine above Paris; the other rises in the department of the Lower Seine, and falls into the English channel, at Creil.

To YERK, *v. a.* [Of unknown etymology. *Dr. Johnson*.—Probably of the same as *jerk*; *hreckia*, Icel. pulsare; *jarke*, pes feriens. *Serenius*.] To throw out or move with a spring.—A leaping horse is said to *yerk* or strike out his

hind legs, when he flings and kicks with his whole hind quarters, stretching out the two hinder legs near together, and even, to their full extent. *Farrier's Dict.*

Their wounded steeds
Fret fetlock deep in gore, and with wild rage
Yerk out their armed heels at their dead masters.

Shakspeare.

To lash; to strike; to beat.

But that same fool, who most increased her pains,
Was Scorne; who having in his hand a whip,
Her therewith *yirks*.

Spenser.

How the freshmen will skip to hear one of those lines well laughed at, that they have been so often *yerked* for! *Echard*.
To YERK, *v. n.* To move as with jerks.—How she [the ship] kicks and *yirks*! *Beaum. and Fl.*

YERK, *s.* A quick motion.

To YERN, *v. a.* See **YEARN**.

YERNAGOODUM, a town of Hindostan, province of the Northern Circars. In the vicinity of this place there are fine forests of timber, which might be conveyed down the Wurda and Godavery rivers to the sea side, at a very moderate expense. Lat. 16. 58. N. long. 81. 39. E.

YERVILLE, a town of France, department of the Lower Seine; 15 miles north-north-west of Rouen. Population 1400.

YES, *adv.* [γῆ, Saxon.] A term of affirmation; the affirmative particle opposed to *no*.—Pray, Madam, are you married?—*Yes*. *More*.—It is a word of enforcement: even so; not only so, but more.—This were a fit speech for a general in the head of an army, when going to battle: *yes*, and it is no less fit speech in the head of a council, upon a deliberation of entrance into a war. *Bacon*.

YEST, *s.* [γερτ, Sax.] The foam, spume, or flower of beer in fermentation; barm.

Yeast and outward means do fail,
And have no power to work on ale.

Hudibras.

The spume on troubled water; foam; froth.—Now the ship boring the moon with her main-mast, and anon swallowed with *yeast* and froth, as you'd thrust a cork into a hog'shead. *Shakspeare*.

YESTER, *adj.* [γερτερν, γερτпан, Saxon; *gestern*, Germ.; *hesternus*, Lat.; old Engl. *hestern*: "hestern-day," *Holinshed*, Deser. of Ireland.] Being next before the present day. It is not often used but in composition with another word, as *day* or *night*.

Love might as well be sow'd upon our sands,
As in a breast so barren:

To love an enemy, the only one
Remaining too, whom *yester* sun beheld
Must ring her charms.

Dryden.

YESTER, a parish of Scotland, in East Lothian, about 3 miles long and 2 broad. Population 1013.

YESTERDAY, *s.* [γερτпанδæγ, Saxon.] The day last past; the day next before to-day.

Naked from the womb
We *yesterday* came forth; and in the tomb
Naked again we must to-morrow lie:

Born to lament, to labour, and to die.

Prior.

YESTERDAY, *adv.* On the day last past.—Marius gave us *yesterday* a representation of the empire of the Turks, with no small vigour of words. *Bacon*.

YESTERNIGHT, *s.* The night before this night.

YESTERNIGHT, *adv.* On the night last past.

Eleven hours I've spent to write it over;
For *yesternight* by Catesby was it sent me.

Shakspeare.

YESTY, *adj.* [From the Sax. *yr̄ȝ*, stormy. *H. Tooke*.] Frothy; spummy; foamy.

Though you untie the winds, and let them fight
Against the churches; though the *yesty* waves
Confound and swallow navigation up.

Shakspeare.

YET, *conjunct.* [γῆτ, γετ, γετα, Saxon; the imperative of

of *geran*, to *get*, to *obtain*. *H. Tooke*.] Nevertheless; notwithstanding; however.

French laws forbid the female reign,
Yet love does them to slavery draw.

Cowley.

YET, *adv.* Beside; over and above.—This furnishes us with *yet* one more reason why our Saviour lays such a particular stress on acts of mercy. *Atterbury*.—Still; the state still remaining the same.—They attest facts they had heard while they were *yet* heathens; and had they not found reason to believe them, they would still have continued heathens, and made no mention of them in their writings. *Ad-dison*.—Once again.

Yet, *yet* a moment, one dim ray of light,
Indulge, dread chaos and eternal night.

Pope.

At this time; so soon; hitherto; with a negative before it.—Thales being asked when a man should marry, said, young men not *yet*, old men, not at all. *Bacon*.—At least; at all. Noting uncertainty or indetermination.—A man that would form a comparison betwixt Quintilian's declamations, if *yet* they be Quintilian's, and the orations of Tully, would be in danger of forfeiting his discretion. *Baker*.—It denotes continuance and extension, greater or smaller.

Shake not his hour-glass, when his hasty sand
Is ebbing to the last:

A little longer, *yet* a little longer,
And nature drops him down without yoursin,
Like mellow fruit without a winter storm.

Dryden.

Still; in a new degree.—He that takes from a thief that which the thief took from an honest man, and keeps it to himself, is the wickeder thief of the two, by how much the rapine is made *yet* blacker by the pretence of piety and justice. *L'Estrange*.—Even; after all. A kind of emphatical addition to a negative.—If any man neglect his duty, his fault must not be ascribed to the rule appointed, neither *yet* to the whole church. *Whitgift*.

Nor *yet* amidst this joy and brightest morn
Was absent, after all his mischief done,
The prince of darkness.

Milton.

Hitherto: sometimes with *as* before it.—Hope beginning here, with a trembling expectation of things far removed, and *as yet* but only heard of, endeth with real and actual fruition of that which no tongue can express. *Hooker*.

YETHOLM, or **ZETHOLM**, a parish of Scotland, in Roxburghshire, about $4\frac{1}{2}$ miles long and 2 broad. Population 1138.

YETHOLM, a village in the above parish, situated on the left bank of the Bowmont water; 3 miles east of Morbattle, and 8 south of Kelso, containing about 550 inhabitants. This part is called *Town-Yetholm*. The other part is situated on the right bank, nearly half a mile distant, and is termed *Kirk-Yetholm*, containing about 350 inhabitants. This place was long inhabited by tinkers or gypsies. It has two annual fairs, 5th July and 31st October.

YETTINGTON, a hamlet of England, in the parish of Whittingham, Northumberland.

YE'VEN, for *given*.

Wants not a fourth grace to make the dance even?
Let that room to my lady be *yeven*;

She shall be a grace,
To fill the fourth place,

And reign with the rest in heaven.

Spenser.

YEW, *s.* [*y*, Saxon; *yw*, Welsh. This is often written *eugh*; but the former orthography is at once nearer to the sound and the derivation.] An ever-green tree used for bows, and planted in churchyards, as an emblem of immortality.

The shooter *eugh*, the broad-leaf'd sycamore,
The barren plantane, and the walnut sound;

The myrrhe, that her foul sin doth still deplore,
Alder the owner of all waterish ground.

Fairfax.

He drew,
And almost join'd the horns of the tough *yew*.

Dryden.

VOL. XXIV. No. 1672.

YE'WEN, *adj.* Made of the wood of yew.

His stiff arms to stretch with *eughen* bow,

And manly legs still passing to and fro.

Spenser.

YEWTON, a hamlet of England, in Devonshire; 1 mile from Crediton.

YEX, *s.* [*hiek*, *hickse*, Belg. *zeocruŋ*, Sax. *Junius*.]

The hiccough.—They do stay the excessive *yex* or hocket. *Holland*.—Ferdinando earl of Derby, dying of a *yex*. *Harrington*.

To **YEX**, *v. n.* To have the hiccough. *Hulbet*.

YEYD, a city of Persia, in the eastern part of the province of Irak, on the frontier of Seistan. It is situated in a sandy desert, contiguous to a range of lofty mountains. Being, however, a great emporium of the trade between Hindostan, Bukharia, and Persia, it is large and flourishing; and is supposed to contain not less than 24,000 houses. Among these, 4000 are occupied by the remains of the Guelires, or ancient worshippers of fire, who, after the extinction of the rest of their unfortunate race, are suffered to exist, though in a very oppressed state, being taxed at twenty piastres a head, in addition to the other heavy burdens paid by the subjects of Persia. Formerly there were a number of opulent Hindoos; but these were driven away by the oppression of a late governor, and have never been induced to return. The chief manufacture of the place consists in silk stuffs, which are superior to any in Persia. The city, however, imports its corn and provisions from the neighbourhood of Ispahan.

YEZD, a village of Laristan, in Persia; 40 miles north of Lar.

YEZEDI, the name of a Persian sect, of which several tribes inhabit the mountains of Sinjar, about eight or ten miles from Nisibis. They are numerous in the vicinity of Mosul, and are said to worship, or rather deprecate, the devil, entertaining an idea that he possesses an unlimited power over mankind. They even dislike to hear the name of the evil spirit mentioned in their presence. They are the descendants of those Arabs who followed the banners of Yezid, and fought against Houssein, in the battle of Kerbela; and scheik Ade, the founder of the sect, is interred near Mosul. They adore one Supreme Being as the creator and benefactor of the human race, drink wine and other strong liquors, and circumcise like the Mahometans.

YEZDIKHAST, a town of Persia, in the southern part of the province of Irak, being the first which occurs on the high road to Ispahan, after passing the frontier of Laristan.

YFERE, *adv.* [*yŷere*, Saxon.] Together.

O goodly golden chayne, wherewith *yfere*

The virtues linked were in lovely wise.

Spenser.

Y-FONG, a town of China, of the third rank, in Honan.

YGUISAN, a small island among the Philippines, near the north coast of Panay. Lat. 11 35. N. long. 122. 32. E.

YICH-KENNISH, a small island of the Hebrides, lying between North Uist and Benbecula.

To **YIELD**, *v. a.* [*zelban*, Saxon, to pay.] To produce; to give in return for cultivation or labour.—Strabo tells us the mines at Carthage *yielded* the Romans *per diem* to the value of twenty-five thousand drachms, eight hundred and seven pounds, five shillings, and ten pence. *Arbutnot*.—To produce in general.—All the substances of an animal, fed even with aceseent substances, *yield* by fire nothing but alkaline salts. *Arbutnot*.—To afford; to exhibit.—If you take the idea of white, which one parcel of snow *yielded* yesterday to your sight, and another idea of white from another parcel of snow you see to-day, and put them together in your mind, they run into one, and the idea of whiteness is not at all increased. *Locke*.—To give as claimed of right.

I the praise

Yield thee, so well thou hast this day purvey'd.

Milton.

To allow; to concede.—I *yield* it just, said Adam, and submit. *Milton*.—I that have not only *yielded*, but challenged the undoubted truth of the proposition, can make no question of its corollaries. *Hammond*.—To permit; to grant.

Life is but air,
That *yields* a passage to the whistling sword,
And closes when 'tis gone. *Dryden.*

To emit; to expire.

Often did I strive
To *yield* the ghost; but still the envious flood
Kept in my soul, and would not let it forth
To find the empty, vast, and wand'ring air. *Shakespeare.*

To resign; to give up: sometimes with a particle, as *up* or *over*.—'Tis the pride of man which is the spring of this evil, and an unwillingness to *yield up* their own opinions. *Watts*.—To surrender: sometimes with *up*.

They laugh, as if to them I had quitted all,
At random *yielded up* to their misrule. *Milton.*

To YIELD, *v. n.* To give up the contest; to submit.

He *yields* not in his fall;
But fighting dies, and dying kills withal. *Daniel.*

To comply with any person, or motive power.—Considering this present age so full of tongue, and weak of brain, behold we *yield* to the stream thereof. *Hooker*.—To comply with things required or enforced.—There could be no secure peace, except the Lacedemonians *yielded* to those things, which being granted, it would be no longer in their power to hurt the Athenians. *Bacon*. To concede; to admit; to allow; not to deny. If we *yield* that there is a God, and that this God is almighty and just, it cannot be avoided but that, after this life ended, he administers justice unto men. *Hakewill*.—To give place as inferior in excellence or any other quality.

Tell me in what more happy fields
The thistle springs, to which the lily *yields*? *Pope.*

YIELDABLENESS, *s.* Disposition to concede or comply with.—The fourth disposition for peace [is] a *yieldableness* upon sight of clearer truths. *Bp. Hall.*

YIELDANCE, *s.* Act of producing.—How should the corn, wine, oil, be had without the *yieldance* of the earth? *Bp. Hall.* Act of complying with; concession.

YIELDEN, a parish of England, in Bedfordshire; 13 miles north-by-west of Bedford.

YIELDER, *s.* One who yields.
Briars and thorns at their apparel snatch,
Some sleeves, some hats; from *yielders* all things catch. *Shakespeare.*

YIELDING, *s.* Act of giving up; submission.
Immaculate and spotless is my mind;
That was not forc'd; that never was inclin'd
To accessory *yieldings*. *Shakespeare.*

YIELDINGLY, *adv.* With compliance.—Maids that know themselves belov'd, and *yieldingly* resist. *Warner.*

YIELDINGNESS, *s.* Disposition to give up any point.—That *yieldingness*, whatever foundations it might lay to the disadvantage of posterity, was a specific to preserve us in peace for his own time. *Ld. Halifax.*

YILEY, a hamlet of England, in the parish of Hales Owen, Worcestershire.

YISSER, a river of Algiers, which falls into the sea at Jinnett.

YLEANG, a town of China of the third rank, in Yunan.

Y-LIN, a city of China, of the second rank, in Houquang. Lat. 30. 52. N. long. 110. 44. E.

YLIGAN, a Small Spanish redoubt and garrison, situated on a bay of the same name, on the north coast of Magindanao.

YLO, or ILO, a seaport town of Peru, in the diocese of Arequipa, situated near the mouth of a fresh water river of the same name, which is dry from the beginning of October to January; 25 miles west of Moquegna. Lat. 17. 38. S.

YLST, an inland town of the Netherlands, in Friesland, with 1200 inhabitants; 15 miles south-south-west of Leeuwarden.

YMASKA, a considerable river of Lower Canada, which

has its rise in some of the high grounds bordering on the frontier which separates Lower Canada from the state of Vermont. It admits of inland navigation for boats and rafts. Its medium breadth is about 400 yards. It falls into Lake St. Peter, after a course generally north or north-west, of 90 miles.

Y-MEN, a town of China, of the third rank, in Yunan.

YNATILAN, a town on the west coast of the island of Sibiu. Lat. 10. 21. N. long. 123. 22. E.

YNCA, YNCAN, or INCA, an appellation anciently given to the kings of Peru, and the princes of their blood; the word signifying literally, *lord, king, emperor, and royal blood.*

The king himself was particularly called *capac ynca, i. e.* great lord; his wife, *pallas*; and the princes simply *yncas*. These *yncas*, before the arrival of the Spaniards, were exceeding powerful. Their people revered them to excess, as believing them to be sons of the sun, and never to have committed any fault. If any person offended the royal majesty in the smallest matter, the city he belonged to was totally demolished.

When they travelled, whatever chamber they lay in on the road was walled up as soon as they departed, that nobody might ever enter in after them. The like was done to the room in which the king died; in which, likewise, all the gold, silver, and precious furniture were always immured, and a new apartment was built for his successor.

His beloved wives, domestics, &c. likewise sacrificed themselves, and were buried alive in the same tomb along with him.

YN-CHAN, a town of China, of the third rank, in Kian-gnan.

YN-CHAN, a town of China, of the third rank, in Hou-quang.

YNG, or YN, a city of China, of the second rank, in Chan-si. Lat. 39. 40. N. long. 112. 49. E.

YN-GIN, a town of China, of the third rank, in Quangsee.

Y-NING, a town of Corea; 33 miles east-north-east of Tsintcheou.

YN-TCHENG, a town of Corea; 25 miles east of Outchuen.

YN-TCHING, a town of China, of the third rank, in Houquang.

YN-TE, a town of China, of the third rank, in Quantong.

YN-YUEI, a city of China, of the second rank, in Yunan. Lat. 25. 58. N. long. 98. 24. E.

YO, a small town of European Russia, in Finland, situated in the province of Cajania, on the river Yo; 55 miles south-east from Tornea.

YOCALLA, a settlement of Peru, in the province of Porco.

YOCARBAYA, a settlement of Peru, in the province of Larecaja.

YOCHAN, a town of China, of the third rank, in Honan.

YOCAAN, a town of China, of the third rank, in Kian-gnan.

Yochin, a small river of Scotland, in Dumfries-shire, tributary to the Nith.

YOCHIN, a town of Corea; 10 miles north-east of Hant-cheou.

YOCKLEDON, a township of England, in Salop; 6 miles west-by-south of Shrewsbury.

YOCOM CREEK, a river of the United States, in Virginia, which runs into the Potomac. Lat. 38. 6. N. long. 76. 36. W.

YOCON, a settlement of Quito, in the province of Cuenca.

YOCOPO, a river of Guiana, which enters the sea.

YOHI, a river of Guiana, which enters the Orinoco.

YOHOGANY. See YOUGHIOGENY.

YOKE, *s.* [*geoc*, Saxon; *jock*, Dutch; *iugum*, Latin; *joug*, French.]—The bandage placed on the neck of draught oxen.—Bring a red heifer, wherein is no blemish, and upon which never came *yoke*. *Num.*—A mark of servitude; slavery.

Our country sinks beneath the *yoke*;

It weeps, it bleeds.

Shakespeare.
A chain;

A chain; a link; a bond.

This *yoke* of marriage from us both remove,
Where two are bound to draw, though neither love.

Dryden.

A couple; two; a pair. It is used in the plural with the singular termination.

To YOKE, *v. a.* To bind by a yoke to a carriage.

Four milk-white bulls, the Thracian use of old,
Were *yok'd* to draw his car of burnish'd gold.

Dryden.

To join or couple with another.

Cassius, you are *yoked* with a lamb
That carries anger as the flint bears fire.

Shakspeare.

To enslave; to subdue.

These are the arms

With which he *yoketh* your rebellious necks,
Razeth your cities.

Shakspeare.

To restrain; to confine.—Men marry not; but choose
rather a libertine single life, than to be *yoked* in marriage.

To YOKE, *v. n.* To be joined with another.—An improper and ill-*yoking* couple.

YOKE-ELM, *s.* [*carpinus*, Latin.] A tree. *Ainsworth.*
YOKEFELLOW, or YO'KEMATE, *s.* Companion in labour.

Yokefellows in arms,

Let us to France.

Shakspeare.

Mate; fellow; commonly partner in marriage.

You cannot think me fit

To be th' *yokefellow* of your wit;

Nor take one of so mean deserts

To be the partner of your parts.

Hudibras.

Those who have most distinguished themselves by railing
at the sex, very often chuse one of the most worthless for a
companion and *yokefellow*.

YOKEFLEET, a township of England, in Yorkshire; 6
miles south-east of Howden.

YO-KEOU, a town of Corea; 38 miles south of Haimen.

YO-KIEOU, a town of China of the third rank, in Kian-
gnan.

YOLD, for *yielded*. *Obsolete. Spenser.*

YOLK, *s.* The yellow part of an egg.—Nature hath provided
a large *yolk* in every egg, a great part whereof remaineth
after the chicken is hatched; and, by a channel made on
purpose, serves instead of milk to nourish the chick for a
considerable time.

YOLOTEPEC, a settlement of Mexico, in the intendency
of Oaxaca, which contains 254 families of Indians.

To YOLP. See To YELP.

YOLTON, a hamlet of England, North Riding of York-
shire; 10 miles from York.

YOM-TCHIM, a town of China, of the third rank, in
Pecheleu.

YON, YOND, or YO'NDER, *adj.* [*zeonð*, Sax.] Being at
at distance within view.—Tigranes, being encamped upon a
hill with 400,000 men, discovered the army of the Romans,
being not above 14,000, marching towards him: he made
himself merry with it, and said, *yonder* men are too many
for an ambassage, and too few for a fight. *Bacon.*—*Yon*
flowery arbors, *yonder* allies green.

YON, YOND, or YO'NDER, *adv.* At a distance within
view. It is used when we direct the eye from another thing
to the object.

The fringed curtains of thine eyes advance,
And say what thou see'st *yond*.

Shakspeare.

First, and chiefest, with thee bring
Him that *yon* soars on golden wing,
Guiding the fiery-wheeled throne,
The cherub, Contemplation.

Milton.

YOND, *adj.* [derivation uncertain.] Mad; furious;
perhaps transported with rage; under alienation of mind;
in which sense it concurs with the rest.

Then like a lion, which hath long time sought

His robbed whelps, and at the last them found

Amongst the shepherd swains, then waxeth wood and *yond*;
So fierce he laid about him.

Spenser.

Nor those three brethren, Lombards, fierce and *yond*.

Fairfax.

YONG-FONG, a town of China, of the third rank in
Kiangsee.

YONG-FOU, a town of China, of the third rank, in Fo-
kien.

YONG-GIN, a town of China, of the third rank, in Ki-
angsee.

YONGHELAHE, a river of the island of Madagascar,
which runs into the sea, on the west side of the island. Lat.
23. 30. S. long. 47. 4. E.

YONG-HING, a town of China, of the third rank, in
Hoo-quang.

YONG-HO, a town of China, of the third rank, in
Chan-si.

YONG-LI, a town of Corea; 30 miles south-east of Ko-
ang-tcheou.

YONG-MING, a town of China, of the third rank, in
Hoo-quang.

YONG-NGAN, a town of China, of the third rank, in
Fo-kien.

YONG-NGAN, a town of China, of the third rank, in
Quang-tong.

YONG-NING, a city of China, of the first rank, in Yu-
nan, on the borders of Thibet. A little to the east of this
town is a fine lake. The district abounds in cows having
those long tails with which the great men of India and China
are accustomed to adorn themselves; 1095 miles south-west
of Peking. Lat. 27. 50. N. long. 100. 24. E.

YONG-NGAO, a small island near the coast of China, in
Quang-tong; 20 miles south-south-east of Macao.

YONG-NGAN, a city of China, of the second rank, in
Quang-see. Lat. 24. N. long. 110. E.

YONG-NGAN, a town of China, of the third rank, in
Hoo-quang.

YONG-NHING, a town of China, of the third rank, in
Kiangsee.

YONG-NHING, a town of China, of the third rank, in
Honan.

YONG-NING, a city of China, of the second rank, in
Quang-see. Lat. 25. 6. N. long. 109. 14. E.

YONG-NING, or YUNG-NING, a city of China, of the
second rank, in Koei-tcheou. Lat. 25. 55. N. long. 104.
57. E.

YONG-PE, a city of China, of the first rank, in Yunan,
in a mountainous district, yet fertile, and watered by a fine
lake. Lat. 26. 42. N. long. 100. 34. E.

YONG-PING, a city of China, of the first rank, in Pee-
che-lee, on a river which runs into the gulf of Leao-tong.
This city is advantageously situated; but its jurisdiction is
not very extensive. It contains but one city of the second
order, and five of the third. It is environed by the sea, by
rivers, and by mountains, covered for the most part with fine
trees. This makes the country less fertile; but the neigh-
bouring bay supplies it with great plenty of all the neces-
saries of life. Not far from this city stands a fort named
Chun-hai, which is the key of the Tartar province of Leao-
tong. This fort is near the eastern extremity of the great
wall, which is built, for a league together, in a boggy marsh,
from the bulwark in the sea: 115 miles east of Peking. Lat.
39. 55. N. long. 118. 34. E.

YONG-SIN, a town of China, of the third rank, in Ki-
ang-see.

YONG-SIN, a town of Corea; 113 miles east of Han-
tcheou.

YONG-TCHANG, or YUNG-TCHANG, a city of China,
of the first rank, in Yunan. This city is tolerably large and
populous, and is built in the midst of high mountains, on the
borders of the province, in the neighbourhood of a savage
people, whose genius and manners the inhabitants of this
country

country partake of. The country produces gold, honey, wax, amber, and a vast quantity of fine silk; 270 miles south-west of Pekin. Lat. 25. 6. N. long. 99. E.

YONG-TCHEOU, a city of China, of the first rank, in Hoo-quang, forming the most southerly city in the province. It is situated on a fine river, amid verdant and well cultivated mountains, particularly abounding in bamboos; 882 miles south-south-west of Pekin. Lat. 26. 10. N. long. 111. 15. E.

YONG-TCHOUEN, a town of China, of the third rank, in Se-chuen.

YONG-TING, a town of China, of the third rank, in Fokien.

YONG-TONG, a town of Corea; 40 miles east of Het-sin.

YONG-TSE, a town of China, of the third rank, in Honan.

YONG-TSONG, a town of China, of the third rank, in Koei-tcheou.

YONG-YANG, a town of China, of the third rank, in Honan.

YONKERS, a post township of the United States, in West Chester county, New York, on the east bank of the Hudson; 20 miles north of New York. Population 1365.

YONNE, a considerable river in the interior of France, which rises in the department of the Nievre, near Chateau Chinon, and after flowing more than 100 miles, falls near Montereaufault Yonne, into the Seine.

YONNE, a department in the interior of France, in the western part of Burgundy and Champagne, situated nearly half way between Paris and the frontier of Switzerland. Its extent, equal to two of our larger counties, is about 2900 square miles; its population nearly 330,000. Its surface consists, in general, of undulating plains, traversed in the south-west by a chain of hills of no great height: the principal river is the Yonne. The climate is temperate, and of sufficient warmth for the vine; the quantity of wine made annually, exceeding 100,000 hogsheads. Its quality is in general good, particularly those sorts which, from their vicinity to the towns, bear the name of Auxerre, Tonnerre, Avalon, Chablis, &c. Corn is cultivated in most parts: also hemp and flax. Fruit is abundant, and several districts contain forests. The pastures are inferior to those of Normandy and other maritime districts, from the want of rain in the summer months. The manufactures are sufficiently varied, but of small amount in any one article, whether linen, hardware, woollen, or cotton. The department is divided into five arrondissemens, viz. Auxerre (the capital), Sens, Tonnerre, Joigny, and Avalon.

YON-NIM-KIEN HOTUN, a town of Chinese Tartary, on the eastern coast of the Yellow sea; 263 miles east of Pekin.

YOOL, or YOWL ISLANDS, a cluster of small islands in the Pacific ocean, so called by Captain Forest, in the year 1774. In 1788 they were by Mr. Meers called *Tuttee Islands*. They lie off the north coast of Wagiau, about the 131st degree of east longitude, and are surrounded by coral reefs.

YOPAS, LAS, a river of Mexico, which rises in Tlascala, and runs into the Pacific ocean. Lat. 17. 10. N.

YOPEZ, a river of Mexico which rises in the mountains near La Puebla, and falls into the Pacific ocean, just below the boundary of the province of Valladolid.

YORE, or *of Yore*, *adv.* [γεοργα, Saxon.] Long ago.

The dev'l was piqu'd such saintship to behold,
And long'd to tempt him, like good Job of old;
But Satan now is wiser than *of yore*,
And tempts by making rich, not making poor.

Pope.

YORK, the capital of Yorkshire, inhabited successively by Hadrian Sevrus, and other Roman emperors, is pleasantly situated on the rivers Foss and Ouse, and, in point of rank, classes as the second city in the kingdom; but it is far surpassed in wealth and populousness by many of the more modern trading towns. That it was long, indeed, the favourite seat of Roman authorities, is attested by many interesting

antiquities found in its immediate neighbourhood. It is entered by four principal gates or bars, viz., that of Meiklegate on the south-west, upon the great London road; Bootham bar on the north-west, upon the road to Newcastle and Edinburgh; Monk bar on the north-east, communicating with Malton and Scarborough; and Walmgate bar on the south-east, giving admission to the traveller from Beverley and Hull. There were likewise, till lately, five posterns; those of North-street, Layerthorpe, Fishergate, Castlegate, and Skeldergate; but the last was taken down in 1808.

Of the six bridges of York, one alone crosses the river Ouse. This, which was begun in 1810, and finished in the succeeding ten years, consists of three elliptical arches, with a plain battlement, breast high, on each side: the span of the centre arch is 75 feet, and the rise $22\frac{1}{2}$ feet; the span of each lateral arch 65, and their rise 20 feet. It is 40 feet in breadth, allowing $5\frac{1}{2}$ feet on each side for foot passengers, and 29 for carriages in the centre. The old bridge, which is supposed to have been erected in the time of archbishop Walter Grey (about A. D. 1235), consisted of five pointed arches; of which the centre one, ranking next to the Rialto in grandeur, was in span 81, and in rise $26\frac{1}{2}$ feet; in order to give egress to the floods rushing down from the Northern Moorlands. From its precarious state, however, and its inconvenient steepness and narrowness, it was deemed expedient to take it down; and with it, St. William's chapel, a beautiful specimen of the early Norman style, which stood at its western foot, necessarily fell a sacrifice. The other five bridges are thrown over the Foss, viz., Monk bridge, Layerthorpe bridge, Foss bridge consisting of one elliptical arch 35 feet in breadth, Castlegate bridge, and the bridge upon the New Walk.

But the cathedral is justly esteemed the glory, not only of York, but of Great Britain. Some of its principal dimensions are as follow:—The whole length from east to west is $524\frac{1}{2}$ feet; breadth of the eastern end, 105; breadth of the western end, 109; length of the cross aisles, from north to south, 222; height of the grand lantern tower, 213; height of the two western towers, 196; height of the nave, or body of the church, 99; height of the eastern window, 75; breadth of the eastern window, 32. Of this magnificent structure, the western front is particularly superb. The eastern end, being of somewhat later date, displays a more florid style of architecture, crowned with elegant niches, and airy pinnacles. Over its incomparable window is seen the statue of the venerable founder of the choir, archbishop Thoresby (who laid its first stone, July 19th, 1361), niched and robed in his archiepiscopal chair, bearing in his left hand the representation of a church, and with his right appearing to point at the window. Below are the heads of Christ and his apostles, with that of a king, supposed to be Edward III. In the niches of the buttresses stand the statues of Robert de Navasor and Robert de Percy, eminent benefactors of the church of York. The great tower, or lantern steeple, supported within by four massive columns, is finished in a style very different from that of the western towers. The cathedral, indeed, which was gradually completed during a lapse of a century and a half (1227—1377), notwithstanding the care employed in combining its different parts, consists of five different tastes of what is usually termed Gothic, but ought more properly to be denominated early English architecture; the high pointed arch struck from two centres, if not originally invented, having certainly been brought to its highest perfection in this country. By a number of these arches, or slender pillars, crowned with plain or slightly ornamented capitals, and also by the absence of prominent buttresses, the south transept, its most ancient part, is distinguished. The windows are comparatively small; and their ornaments, with the pillars and arches, display a marked difference from those which occur in the other parts of the fabric. The southern side of the choir presents an appearance peculiarly striking. The massive columns, decorated with a variety of figures, and terminating in rich pinnacles, the large windows of beautiful tracery, the small transept of the choir, with its noble light, and the screen work before the

the three farthest windows of the upper tier, all concur to render it eminently magnificent.

With the splendid exterior, its interior perfectly corresponds. The cross aisle exhibits a superb specimen of the style of architecture which prevailed in the latter years of the reign of Henry III. The circular arch, inclosing others of the pointed form, is still seen in the upper part. The angular pillars, supporting the larger arches, are encompassed by slender columns a little detached; and the rich leafy capitals of all the columns, unite to form a foliated wreath around their heads. The windows are long, narrow, and pointed, consisting of one light, or divided into several by unramified mullions, and variously decorated on the sides by slight freestone or marble shafts. Between the upper arches appear the *quatre-feuille* and *cinq-feuille* ornaments, subsequently transferred to the windows, and there forming the first step towards the exquisite tracery displayed in the nave and the choir. The windows in the southern end are arranged in three tiers; the uppermost composed of two concentric circles of small arches, and admired as a fine piece of masonry; the three windows of the second tier exhibiting the archbishops St. William and St. Wilfrid, and between them the two apostles Peter and Paul, with their characteristic insignia; and the four figures of the lowermost tier, (Abraham, Solomon, Moses, and Peter,) forming an honourable memorial of the talents of a native artist, the late Mr. Peckett, of York. At the northern end, the windows are disposed in two tiers, the lower of which, a single window of exquisite beauty, is divided into five lancet-shaped lights, each about 50 feet high, and 5 in breadth. These are usually called the Five Sisters, from a tradition that five maiden sisters incurred the expense of putting them up. Their coloured glass represents rich embroidery or needlework; and a small border of clear glass, running round the margin of each, adds greatly to their effect. The tall and slender columns also, which stand before them in small clusters, give an air of singular grace and lightness to their appearance.

The screen, which separates the nave from the choir, is a very curious piece of workmanship; but its history is unknown. Its extremely florid style of decoration, however, marks an age later than that in which the chief part of the choir was completed, and may with great probability be referred to the reign of Henry VI., whose statue occupies the last niche in the royal series, reaching downward from William I. The original statue of this monarch was taken down, according to tradition, on account of the adoration paid to it by the people; and the niche remained empty till the reign of James I. whose effigy, on his first visit to York, it was thought proper to place in the vacancy. This has been recently removed to Ripon Minster. In the architecture of the choir, a signal variation from that of the nave is perceptible. The roofing displays more tracery; an elegant festoon-work descends from the capitals of the pillars, from which the vaulting springs; and the whole exhibits an approach to the florid style which prevailed before the end of the 15th century. The crypt below the altar is a fine imitation of Saxon architecture, which had long been disused when this part of the edifice was founded. But the eastern window is unrivalled in magnitude and in beauty, upwards of 200 compartments being filled with representations of the Supreme Being, of monarchs, mitred priests, and saints, and of most of the principal events recorded in Scripture. Its glazing was begun at the expense of the dean and chapter, in the year 1405, by John Thornton of Coventry, who contracted to receive four shillings per week for his work, and to finish it in three years. He was also to receive, in addition, one hundred shillings per annum, with ten pounds more if he executed the work well. In 1804, the earl of Carlisle presented to the cathedral a fine painted window, originally brought from the church of St. Nicholas, at Rouen in Normandy. Its subject is the meeting of the Virgin Mary with Elizabeth.

The chapter-house is a magnificent structure, and singular

in its kind. Its form is an octagon of 63 feet in diameter, and nearly 68 feet in height, estimated to the centre knot in the roof. Of this vast area, the roof is supported by a single pin, geometrically placed in the centre. The stalls for the chapter, ranged round the sides, are highly finished in stone; and the curiously wrought canopies are supported by elegant columns of the finest marble. The entrance from the north transept is in the form of a mason's square. The alternate sides are adorned with windows rich in figured glass, and reaching to the roof.

The vestry contains several antiquities, viz., silver chalices, found in the graves of archbishops; a wooden head, supposed to be part of the effigy of archbishop Rotheram, who died of the plague in 1500; several ancient rings; a pastoral staff of silver, given by Catherine, queen dowager of England, to her confessor, on his nomination to the see in 1637, and wrested from him by the earl of Derby, on his way to the cathedral; a chair, of the date of the heptarchy, in which several Saxon kings were crowned, &c. But the most important relic is a large horn, made of an elephant's tooth, by which the church of York holds several lands of great value, bestowed about A.D. 1036. Stripped of its golden chain and other decorations, and taken away (if not at the reformation), during the civil wars under Charles I., it was subsequently restored by Henry, son of Thomas lord Fairfax, and now bears a Latin inscription, commemorating his generosity.

The library, originally founded by archbishop Egbert in 740, was subsequently much increased by Alfred, and is highly commended by the learned Alcuin, both in his epistle to the church of England, and in a letter to the emperor Charlemagne. It was totally consumed by fire in the year 1069. A second met with the same fate, little more than a century afterwards. The present library originated about A.D. 1628, from the liberal donation of the books of archbishop Tobias Matthew (made by his widow), consisting of above 3000 volumes. It has since been increased by the liberality of lord Fairfax, archbishop Dolben, and the Rev. Mam. Fothergill; and, among other curious works, contains a beautiful copy, on vellum, of Rasmus' second edition of the New Testament, (two vols. folio, 1519) with some specimens from the press of Caxton, one of which is the first edition of "the Chorte and the Birde."

The chapter of York, in addition to the archbishop, includes a dean, four archdeacons, a precentor, a chancellor, a subdean, twenty-nine prebendaries, a succentor, five vicars choral, &c.

Besides the cathedral, York contains 20 parish churches within the walls, and three (St. Olave, St. Maurice, and St. Lawrence) in the suburbs: of these, a small number claim to be particularly noticed. The church of All Saints, in North-street, divided by pillars into two spacious aisles, has some well preserved painted glass in the windows, and a fine spire. Its southern wall appears to be very antique, being composed of gritstone and pebble, intermixed with Roman brick. St. Mary's, in Castlegate, is chiefly distinguished by its lofty spire. All Saints, (or All Hallows) in the Pavement, is an ancient rectory, seated on the highest ground in the city, and belonging, previously to the conquest, to the prior and convent of Durham. Its northern side is almost wholly built out of the ruins of the old *Eboracum*. Its tower is esteemed an exquisite piece of Gothic architecture: the top is finished in the lantern form; and tradition reports, that of yore a large lamp flamed there throughout the night, as a mark for travellers crossing the vast forest of Galtres, which extended from near Bootham bar, as far as Craike castle, to the north of the city. The hook, or the pulley by which it was suspended, still remains within the steeple. St. Denys, in Watergate, is principally remarkable for a large blue marble, bearing two effigies, with a brass inscription around it, now totally defaced. As the palace of the earls of Northumberland stood on the northern side of the fabric, this marble is supposed to cover the body of one of that family, probably earl Henry, who fell among the

Lancastrian victims, at the battle of Towton. The church of St. Margaret, in the same street, is celebrated for its singular Saxon porch, brought (as Drake affirms) from the church of St. Nicholas, out of Watergate bar; for there were originally nearly double the present number of parish churches in York, which were destroyed during the siege of 1644. This porch, formerly deemed the richest performance of the kind remaining, (those of Glastonbury, Malmsbury, and Dunstable, not excepted) displays a circular arch, with representations of the twelve signs of the Zodiac, and the twelve months alternately, and exhibits a beautiful specimen of the device which became common a little antecedently to the extinction of the Saxon style, viz., a carving round the heads of arches, like trellis placed in broad lozenges, and considerably projecting.

But among all the religious edifices in and near York, the ruined abbey of St. Mary, next to the cathedral, merits the greatest attention. This magnificent edifice was situated immediately without Bootham bar. Its site, covering nearly a square plot of ground (from the north road to the Ouse, and from the city wall to Marygate) is 1280 yards in circuit. Of this once noble structure, there now remains only a small part of the abbey church or cloister, of which the divisions appear, from an accurate measurement, to have been 371 feet in length, and 60 in breadth. The annual revenues of this wealthy monastery, at the dissolution of religious houses under Henry VIII., were computed at 1550*l.* 7*s.* 9*d.* by Dugdale, and at 2085*l.* 1*s.* 5*½d.* by Speed. Nor were its privileges less distinguished. Its mitred abbot had a seat in parliament; and when the Yorkshire barons were summoned to war, his commissioner bore the standard of St. Mary in the royal army. In number and splendour his retinue scarcely yielded to that of the archbishop; and he possessed various and magnificent country houses, for occasional retirement. When, upon the dissolution above referred to, it was converted to civil uses, the manor-house, constructed out of its ruins, became the residence of the lords presidents of the north; and it is now held by lease under the crown, by lord Grantham, as representative of the family of Robinson.

The castle of York is of great antiquity. The present site was selected, according to some writers, in the time of William the Conqueror; but the fabric of that date falling to decay, it was repaired or rebuilt under Richard III. Dismantled of its garrison, it was converted into a county prison for felons and debtors, till again becoming ruinous, it was wholly taken down, and the existing structure erected in 1701, the expense being defrayed by a tax of three pence per pound rent on all lands, &c. in the county. The prison for debtors is scarcely anywhere equalled. In the left wing is a chapel. The court-yard for felons lies between the two wings: and the cells, 15 in number, are each about 7½ feet, and 8½ feet high. The four condemned rooms are about 7 feet square. The women-felons, being kept separate, have two court-yards. Their condemned room is in another part of the building.

The Basilica, or new county-hall, was opened at the summer assizes, in 1777. It is of the Ionic order, 150 feet in length, and 45 in breadth. Its two courts (the civil and the criminal) are respectively 30 feet in diameter, and crowned with a dome 40 feet high, supported by 12 Corinthian columns. The entrance into this structure is by a portico of six lofty columns. The opposite building on the east was erected in 1780: it contains apartments for the clerk of assize, the county records, an indictment-office, hospital-rooms, cells for the women felons, &c.: in length it extends 150 feet, and is adorned in front with a colonnade similar to that of the county-hall. Great improvements throughout the castle have recently taken place, and more are still meditated.

The mansion-house is an elegant building, erected in 1725, as a suitable residence for the chief magistrate of the city. Its rustic basement in front supports an Ionic order, with a pediment, wherein are displayed the city arms, originally only argent with a cross gules, till the five lions were

added by William I., in honour of the five brave magistrates who defended the city against him in 1070. To this external character, the interior, in rich plate, spacious apartments, and excellent portraits, well corresponds.

Behind it, and on the banks of the river, stands the guild-hall, erected in 1446, and regarded as one of the finest Gothic halls in the kingdom. It is 90 feet in length, 43 in breadth, and 29½ from the floor to the centre of the roof, which is supported on ten octagon pillars of solid oak, on stone bases. Its windows present some fine specimens of painted glass. In this hall was formerly held the court of the lords presidents of the north.

Although the foreign commerce of York is totally annihilated, it still retains a considerable river trade; and vessels of 120 tons burden come up the Ouse as high as the bridge, near which there is a convenient quay. Some business is also transacted in gloves, linens, livery lace, glass, and drugs; and printing and bookselling are conducted on a large scale. The charter, however, granted to it by successive monarchs for its benefit, having prevented the beneficial settling of strangers, and the consequent introduction of manufactures, it derives its principal support from its fairs, assizes, and races, and the winter residence of many of the provincial gentry, by whom it is regarded as a kind of northern metropolis. The race-ground (expressively called Knavesmire), is, by its horse-shoe form, admirably adapted for displaying the competition of the horses throughout the whole of the course. The theatre is a neat building, erected in 1769. Improvements, now in progress, will greatly facilitate the admission, in which respect it has hitherto been very inconvenient; and a handsome saloon is included in the meditated alterations.

The assembly-room, in Blake-street, was built in 1730, on a plan designed by the celebrated earl of Burlington. Its grand apartment (an antique Egyptian hall, after Palladio, 112 feet in length, and 40 in breadth and in height), consists of two orders, the lower part, with 44 columns, rich capitals, and an elegant cornice, displaying the Corinthian, and the upper the Composite order, highly decorated with festoons, in imitation of acorns and oak-leaves.

Besides the above specified public buildings, there are two well conducted receptacles for lunatics, the asylum and the (Quakers) retreat; a county hospital, and a city dispensary; a blue-coat boys' and a grey-coat girls' charity school, great national schools for boys and girls, &c.; a saving-bank, established in 1816, the deposits in which (from 1600 contributors) exceed 60,000*l.*; a subscription library, founded in 1794, and supported by upwards of 480 members; a city jail, and a house of correction; with various chapels for Roman Catholics, Wesleyan Methodists, Quakers, Presbyterians, and Independents; and about three miles from York stands Bishophorpe, the magnificent palace of the honourable Edward Venables Vernon, archbishop of York.

The markets of York are held on Tuesdays, Thursdays, and Saturdays, more particularly on the latter; and the great fairs on Whit-Monday, July 10th, August 12th, and November 23d; 198 miles north-by-west of London. Population 35,543.

YORK, the capital of Upper Canada, exceedingly well situated in the township of the same name, on the north-west coast of Lake Ontario, on the north side of an excellent harbour. It is very regularly laid out, with the streets running at right angles, and promises to become a very handsome town. The plot of ground marked out for it extends about a mile and a half along the harbour, but at present the number of houses does not greatly exceed 300, the greatest part of which are built of wood; but there are, however, many very excellent ones of brick and stone. The public edifices are a government house, the house of assembly for the provincial parliament, a church, a court-house, and a gaol, with numerous stores and buildings for the various purposes of government. The garrison is situated to the westward of the town, at a mile distance: it consists of barracks for the troops usually stationed here, a residence for the commanding officer, now most frequently occupied by the

the lieutenant-governor of the province, a battery, and two blockhouses, which together protect the entrance of the harbour. The space between the garrison and the town is wholly reserved for the use of government. The harbour of York is nearly circular, and formed by a very narrow peninsula stretching from the western extremity of the township of Scarborough, in an oblique direction, for about six miles, and terminating in a curved point, nearly opposite the garrison; thus inclosing a beautiful basin, about a mile and a half in diameter, capable of containing a great number of vessels, and at the entrance of which ships may lie in safety during the winter. The formation of the peninsula itself is extraordinary, being a narrow slip of land, in several places not more than 60 yards in breadth, but widening towards its extremity to nearly a mile. It is principally a bank of sand, with a very little grass upon it. The widest part is very curiously intersected by many large ponds, that are the continual resort of great quantities of wild fowl. A few trees scattered upon it greatly increase the singularity of its appearance. It lies so low that the wide expanse of Lake Ontario is seen over it. The termination of the peninsula is called Gibraltar Point, where a block-house has been erected. The eastern part of the harbour is bounded by an extensive marsh, through part of which the river Don runs, before it discharges itself into the basin. No place in either province has made so rapid a progress as York. In the year 1793, the spot on which it stands presented only one solitary Indian wigwam. In the ensuing spring, the ground for the future metropolis of Upper Canada was fixed upon, and the buildings commenced under the immediate superintendance of the late general Simcoe, then lieutenant-governor. In the space of five or six years it became a respectable place, and rapidly increased to its present importance: it now contains a population of 2500 souls. The parliament of the province annually holds its sittings here, as do all the courts of justice. Considerable advances have also been made in the commerce, general opulence, and consequent amelioration of its society. Being the residence of the chief officers of government, both civil and military, many of the conveniences and comforts of polished life are to be met with. A newspaper is printed once a week, and indeed at Kingston also. The lands of the adjacent townships, for several miles round, are in a high state of cultivation, so that the market of the town is always well supplied. The pressure of the late war has been considerably felt here, as it was captured by the American army on the 27th April, 1813. They held it, however, but a few days; but in that time the government-house, and all the public buildings and stores, were burnt, after removing so much of their contents as could be conveniently carried off.

YORK, a county of the United States, in Maine, bounded north by Oxford county, north-east by Cumberland county, south-east by the Atlantic, and west by New Hampshire. Chief towns, York and Alfred. Population 41,877.

YORK, a seaport of the United States, and capital of York county, Maine. It contains a court-house and a jail. The courts for the county are held alternately here and at Alfred. A little business is carried on here in the fisheries. The shipping belonging to this port in 1816, amounted to 1432 tons; 67 miles north-north-east of Boston. Population 3046. Lat. 43. 16. N.

YORK, or **YORKTOWN**, a township of the United States, in West Chester county, New York; 45 miles north of New York. Population 1924.

YORK, a county of the United States, on the south side of Pennsylvania, bounded north-east by the Susquehanna, which separates it from Dauphin and Lancaster counties, south by Maryland, west by Adams county, and north-west by Cumberland county. Population 31,958.

YORK, a borough of the United States, and capital of York county, Pennsylvania, on Codorus creek. It is a pleasant and flourishing town, regularly laid out, and contains a court-house, a jail, a market-house, an alms-house, a register's office, an Episcopal academy, and eight houses of public worship, one for Episcopalians, one for English Pres-

byterians, one for German Presbyterians, one for German Lutherans, one for Roman Catholics, one for Methodists, one for Friends, and one for Moravians. A large part of the houses are handsomely built with brick. A number of the public buildings are spacious and elegant. The surrounding country is fertile and very pleasant; 48 miles north of Baltimore, and 85 west of Philadelphia. Population 2847. Lat. 39. 58. N. long. 76. 40. W.

YORK, a township of the United States, in York county, Pennsylvania. Population 1640.

YORK, a county of the United States, on the east side of Virginia, bounded north by York river, east by Chesapeake bay, south by Elizabeth City, Warwick, and James City counties, and west by James City county. Chief town, Yorktown. Population 5187. Slaves 2931.

YORK, a short and navigable river of the United States, in Virginia, formed by the union of the Pamunkey and Mattaponi. It flows into the Chesapeake, opposite Cape Charles.

YORK, a township of the United States, in Belmont county, Ohio. Population 1349.—2. A township of Montgomery county, Ohio.

YORK, a district of the United States, in the north part of South Carolina. Population 10,032, including 3164 slaves.

YORK, a post town and capital of the United States, in York district, South Carolina; 30 miles north of Columbia.

YORK BAY, a bay on the south-west coast of the island of St. Vincent; 2 miles north-west of Kingstown Bay.

YORK BAY, a bay formed by the union of the East and Hudson's rivers, below New York. It is formed by the confluence of East and Hudson's rivers, and embosoms several small islands, of which Governor's island is the principal. It communicates with the ocean through the Narrows, between Staten and Long islands, which are scarcely 2 miles wide. The passage up to New York, from Sandy Hook, the point of land that extends furthest into the sea, is safe, and not above 20 miles in length. The common navigation is between the east and west banks, in about 22 feet water. The lighthouse at Sandy Hook is in Lat. 40. 30. N. and long. 74. 2. W.

YORK, CAPE, the north-east projection of New Holland, consisting of a double point, one of which is situated Lat. 10. 37. S. long. 141. 36. E.; the other in Lat. 10. 42. S.

YORK, FORT, a fortress at the mouth of Nelson's river, in Hudson's bay. Lat. 57. 2. N. long. 92. 46. W.

YORK, HAVEN, a post village of the United States, in York county, Pennsylvania.

YORK ISLAND, a small island, near the east coast of the island of Antigua, about half a mile north-north-east of Frier's Head.

YORK ISLAND, one of the Gallipagos islands, in the Pacific ocean.

YORK ISLANDS, three small islands in the South Pacific ocean, near York Cape, on the north coast of New Holland.

YORK MINSTER, a lofty promontory on the coast of Terra del Fuego, so called by captain Cook in 1774. It forms the north-west point of entrance into Christmas Sound. Lat. 55. 26. S. long. 70. 25. W.

YORK, POINT, a cape in the straits of Magellan. Lat. 53. 39. N. long. 73. 32. W.

YORK ROAD, a road for ships in the straits of Magellan, near the coast of Patagonia. The only danger of sailing into the bay, that is formed by two points in this road, arises from a reef that runs off to about a cable's length from the western point, which, once known, may be easily avoided. To anchor in this bay, it is safest to bring York Point east-south-east; Batchelor's river north by west half west; the west point of the bay or reef north-west half west; and St. Jerom's sound west-north-west, at the distance of half a mile from the shore. There is good watering about a mile up Batchelor's river, and good wooding all round the bay, where the landing also is, in all parts, very good. There is plenty of celery, cranberries, muscles, and limpets, many wild-fowl, and some fish, but not enough to supply a ship's company with a fresh meal. Lat. 53. 39. S. long. 73. 52. W.

YORKSHIRE,

YORKSHIRE, a maritime county of England, inhabited, prior to the Roman invasion, by the populous and powerful Brigantes, and far exceeding in magnitude any of the other counties in the kingdom. It extends 100 miles in length from east to west, 75 in breadth from north to south, and 380 in circumference. It is bounded on the east by the German ocean; on the south by the river Humber, which separates it from Lincolnshire, and by the counties of Nottingham and Derby; on the west by a small part of Cheshire, by Lancashire, and by Westmoreland; and on the north by Westmoreland, and the county or bishopric of Durham. It is divided into 29 wapentakes, exclusive of the Ainsty of the city of York; contains one city and 59 market towns, of which latter 13 are boroughs; and sends 32 members to parliament. Its superficial content is computed at 3,698,380 acres; and its population is estimated at 1,175,251 persons.

This county has three subdivisions, called the North, East, and West Ridings. The North Riding contains 1,311,187 acres, of which about one-third (442,565) remain uncultivated, and the rest are distributed into inclosed lands, open fields, woods, and roads. The face of the country from Scarborough northward is bold and hilly, the cliff being generally from 60 to 150 feet high. At Stoupe or Stow Brow, about 14 miles north of that place, it is stated to rise to the stupendous height of 893 feet. Inland from these lofty crags, successive hills rear themselves one above another, into the elevated and dreary tract of the Eastern Moorlands, occupying a space of about 30 miles from east to west, by 15 from north to south, and penetrated occasionally by romantic and fertile dales; but in their ordinary character bleak and desolate, and in many instances nearly covered with huge freestones, or rendered hazardous by vast beds of peat and morass. Their western extremity, called the Hambleton hills, consists generally of a loamy soil, upon a limestone rock, producing large quantities of coarse grass and bent, in some cases, particularly towards the south-east, mixed with heath. Of the dales which they embosom, several contain from 5000 to 10,000 acres, and Eskdale and Bilsdale much more. Their width, indeed, at the bottom, is often inconsiderable, not exceeding 200 or 300 yards; but they are frequently cultivated from half a mile to a mile and a half up the hill sides, though the surface is occasionally extremely irregular. In these dales alone, throughout the Moorlands, is any wood to be found. In journeying from Whitby to Guisborough, Stokesley, and Pickering, the traveller sees around him a vast and wild solitude, enlivened only by a few straggling sheep. Some of the heights, however, near the edge of this rugged region, command picturesque and magnificent prospects. The most striking object is the singular peak called Roseberry Topping, which serves as a landmark to sailors. Its base is composed of immense strata of alum rock. Iron-ore is also found in various parts of the district.

The Vale of York, with some irregularities of surface, slopes southward from the Tees, as far as York, where it sinks into a nearly perfect flat. Of this tract, the northern part is bounded on each side by the Moorlands, except where it opens into Cleveland, or is divided from Ryedale by the Howardian hills. Within 10 miles of York, however, it expands into a wider breadth, extending eastward as far as the Wolds in the East Riding, and to the Humber on the south. The Western Moorlands form a part of the long range of mountains stretching northward from Staffordshire to Scotland. These being chiefly calcareous, surpass in fertility those in the eastern part of the Riding, which have been already described. First, among the rich and romantic valleys by which they are intersected, stands Wensleydale, a tract of fat pasturage, through which the Ure winds its way, forming in some places beautiful cascades. It is bounded by hills rising irregularly on each side to a considerable height, and inclosed to the distance of a mile, or a mile and a half, from the banks of the river. Several small dales open into it from the south. The soil near the river is generally a rich loamy gravel.

Next to Wensleydale in extent, and not much inferior to it in fertility, must be placed Swaledale; though, from the circumstances of its being much narrower, and bounded by hills of a much steeper ascent, it is by many deemed more romantic. The smaller dales, which are numerous, exhibit the same general appearances. Even the mountains are in few instances deformed by those marks of unconquerable sterility which characterise the Eastern Moorlands. Many of them are covered with a short sweet grass, or with bent; and the heath growing upon others is generally mixed with verdure of various descriptions.

Of the different minerals of the North Riding, few are converted to any considerable advantage, if we except the alum-rock on the east edge of the Eastern Moorlands, and the lead in the district of Richmondshire. A mine of fine copper, near Middleton Tyas, was worked for a few years, about the middle of the last century. Several parts of these Moorlands appear to contain large quantities of iron-stone, of which beds also exist in the vicinity of Whitby; but whatever is produced from them, in consequence of the want of coal, is smelted in the works of the north. A narrow ridge, likewise, of limestone, producing a lime peculiarly valuable for agricultural purposes, extends for nearly thirty miles along the Moorland edge above mentioned; and freestone, admirably adapted for building, is found in several parts of the Riding. The Western Moorlands consist almost wholly of limestone, which abounds also in the Hambleton and Howardian hills. Their marbles, though in many instances they surpass, in closeness of texture, and distinctness of colours, those of Derbyshire, are chiefly applied to the making of lime, or the mending of roads. In some places near the north-western extremity of the Riding, vast blocks of a light red granite lie scattered over the face of the country; but they are not employed in any way as materials. The coal, which is found in the district in small quantities, is of a very inferior kind.

The climate, in consequence of the different elevations of different parts of the country, and other topographical circumstances, includes considerable varieties. In the Vale of York it is mild and temperate, except near the Moors, where the influence of the winds is sometimes severely felt. On the Howardian hills, which, from their height, as well as their vicinity to the Eastern Moorlands, are bleak and cold, the harvests ripen more tardily. Ryedale, and the marshes on the skirt of the Derwent, enjoy a softer temperature; but the want of a more effectual drainage, though above 11,000 acres, between Hurmanby and Malton, have recently been converted from swampy to solid grounds, renders them still less healthful than other parts of the Riding. This coldness of climate, arising chiefly from the great elevation of the Eastern Moorlands, presents an insurmountable bar to all attempts at improvement, otherwise than by planting. Their highest parts are computed to be between 1400 and 1500 feet above the level of the sea, an altitude at which, between the latitudes of 54° and 55°, corn will not ripen. About the end of August, the morning clouds, in the form of dense fogs, impinge against their sides, and rise above them, or remain upon them, during the day, as the sun has more or less influence in rarefying the atmosphere. In the advanced autumn they hang lower upon the hills; and if they ever leave their summits uncovered, it is usually for a very short period. The country is then for some months, with little interruption, enveloped in mists, chilled with rain, or locked up in snow, and can of course be applied to no other purpose than that of supplying a scanty pasturage for a few dwarfish cattle and sheep.

With these Moorlands on the south-east and east, the sea on the north-east and north, and an extensive and mountainous country on the west, the Vale of Cleveland has a climate somewhat severe; but from the dryness of the soil, and the frequent use of lime, its harvests are nearly as early as those of the warmer parts of the Riding. The same remark may be made upon the narrow tract extending along the coast, from Whitby to Scarborough.

The Western Moorlands, though, from their calcareous composition,

YORKSHIRE.

Figured for the Encyclopædia Britannica, 1874.

J. Ross sc.

composition, possessing a soil more favourable to vegetation than those of the east, are considerably colder in climate, being far more elevated, and generally (as not exposed to the sea air) much longer covered with snow. In Yorkshire, and the other English counties bordering on the German ocean, during a great part of the spring the east wind usually predominates, as does the west on the western side of the island. To the conflict of these two winds on the Western Moorlands, may probably be ascribed the rains which fall, with little intermission, in this mountainous district.

The principal rivers of this division are the Swale, the Tees, and the Derwent.

The North Riding is divided into twelve wapentakes, viz. Allertonshire, Birdforth, Bulmer, Gilling East and West, Halikeld, Hang East and West, Langbaugh, Pickering Lyth, Ryedale, and Whitby Strand; containing five boroughs, Malton, Northallerton, Richmond, Scarborough, and Thirsk. The total population 183,694.

The East Riding is bounded on the north and the west by the little river Hartford and the Derwent, which separate it from the North Riding, as far as the vicinity of Stamford Bridge. An irregular line from the Derwent to the Ouse, commencing about a mile above that place, and joining the latter river a little below York, forms the remaining limit between these two Ridings. From that point it is bounded on the west and south-west by the Ouse, which divides it from the West Riding; on the south by the Humber; and on the east by the German ocean.

This division of Yorkshire, though far less conspicuously marked by the bolder features of nature than the other parts of the county, contains scenes of great extent and magnificence, especially where the sea or the Humber enters into the view. It may be considered as consisting of three different districts; the Wolds, a range of chalky hills extending from north to south, through nearly the whole of the Riding; and the two level tracts which lie to the east and west of them respectively. Of these, however, the first, stretching from Filey, through Hurmanby and Bridlington southward, is occasionally diversified by considerable swells; the Wolds extending to the coast, which, near the villages of Speeton, Bempton, and Flamborough, rises in cliffs of 300 or 400 feet in perpendicular altitude. At Bridlington, the country sinks into a flat, which continues towards the south for eight or nine miles, with little variation. Here commences the wapentake of Holderness, of which the eastern part is somewhat variegated; while its western edge, of about four or five miles in breadth, and twenty in length, as far as the banks of the Humber, is low and fenny. The southern part of Holderness also, along the borders of that vast estuary, partakes of the same character; and the county terminates in a point at the *Ocellum Promontorium* of Ptolemy, now called Spurn-head. Throughout this level district, however, the prospects are, to a considerable degree, enlivened by views of the Yorkshire or the Lincolnshire Wolds. Clay and loam are its predominant soils.

The ascent to the Wolds is generally rather steep, except on the eastern side, where they rise in gentle acclivities. But their greatest height, which is not calculated at more than 600 feet, falls far below that of the East or West Moorlands in the north of the Craven hills, in the West Riding. Their extent is variously estimated: it cannot, probably, be less than 400,000 acres. Their surface is divided into extensive plains, with many intervening dales or valleys. The soil is commonly a somewhat light loam, with a mixture of gravel on a substratum of chalk; but in some parts occurs a deeper loam, and in others a poor and almost unproductive sand.

The third division, extending from the western foot of the Wolds to the boundaries of the North and West Ridings, and usually called the Levels, is everywhere unpicturesque. The soil is generally clay or sand. An extensive sandy, and in some places moorish tract, runs through the middle of it; but near the banks of the Derwent and the Ouse, it consists chiefly of a clayey loam; and from Howden and Gilberdike southward to the latter river, of a very strong clay. This

part of the country, though overspread with houses and hamlets, is extremely dirty and disagreeable.

In few parts of England has agriculture been conducted on a larger scale, or brought to a higher degree of perfection, than in the East Riding of Yorkshire, particularly upon the Wolds. In that district, half a century ago, barley and oats were the principal kinds of grain produced: and of the former was made the chief portion of the bread used by the inhabitants. Now the valleys and slopes of the hills wave with wheat; and with wheat bread alone are the servants and labourers supplied. The Western Levels also have received great improvements. Within the last thirty years, vast commons in its southern part (about Wallingfen) have been inclosed and cultivated; and a dreary and swampy waste, which in fogs or stormy weather could not be crossed without danger, is now covered with well built farmsteads, and intersected in various directions with excellent roads.

The climate of the East Riding includes some varieties, as the Wolds break the force of the cold and raw winds which blow from the German ocean, and check the vegetation of the early spring on their eastern side. The manufactures in this district being less extensive, and the population consequently less crowded than in the other Ridings, its produce is more than adequate to its consumption, and it exports grain, bacon, butter, and potatoes. It furnishes wool also in large quantities to the West Riding clothiers; and great numbers of horses are purchased at the York and Howden fairs, by the London dealers. Hull is its grand emporium of foreign trade. The chief manufacture of the Riding is established at Wansford, near Driffild, for carpets and spinning cotton. Having little wood, it receives its coal for fuel chiefly from the neighbourhood of Wakefield and Leeds, except upon the coast, which is supplied from the Sunderland and Newcastle pits.

It is divided into seven wapentakes, viz. Dickering, Buckrose, Harthill, Holderness, Howdenshire, Ouse, and Derwent, and the town and county of Kingston-upon-Hull. The population is stated at 190,709. It contains three boroughs, Beverly, Hedon, and Hull.

The West Riding, far exceeding in size the two other divisions of the county, is computed to contain about 1,568,000 statute acres. It is bounded on the north by the North Riding, on the east by the East Riding and Lincolnshire, by Derbyshire and Nottinghamshire on the south, and by Cheshire, Lancashire, and Westmoreland on the west; and may be divided into three extensive districts, varying from a level and marshy to a rough and mountainous region. The level part, of unequal breadth, extends westward from its eastern side, along the banks of the Ouse, to within three or four miles of an imaginary line drawn from Doncaster to Sherburn. Its middle district rises gradually into hills, and is beautifully variegated; after which, proceeding still farther westward, we find the surface in the third division extremely rugged and barren. Beyond Sheffield, black moors, running to the north-west, unite with the lofty hills of Blackstone Edge, on the borders of Lancashire; while the western part of Craven presents a confused heap of rocks and mountains; among which, Pennigart, Ingleborough, and Wharfedale, stand eminently conspicuous, being estimated at the heights of 3930, 3987, and 4052 feet respectively. Amidst these dreary regions, however, occur many romantic valleys (such as Hetherdale, Wharfedale, and the vale of the Aire) presenting the most picturesque and beautiful scenery; the greatest part of them being inclosed, well wooded, and thickly studded with flourishing and almost continuous villages.

By Mr. Smith the Riding is divided into four divisions, viz. 1. On the east the Levels, traversed by the great rivers Ouse, Aire, and Don, which, from the vast quantities of mud suspended in them during the agitation of the tide, have afforded great service to agriculture, through the profitable operation of warping. 2. The Magnesian Limestone, which forms a narrow range of dry land, running northward from Tickhill by Doncaster, Ferrybridge, Wetherby,

Knarborough, and Ripon; and supplies from its laminated upper part a lime valuable as manure; while the lower or freestone part is excellent for building. 3. The Coal tract, occupying the most populous part of the Riding, and characterised by successive parallel ranges of high ground, whose longest general course is nearly north and south. 4. The Moorlands and Metalliferous Limestone or Mining districts, comprehending the wide and barren heaths west of Sheffield, Peniston, Huddersfield, Bradford, Otley, Harrogate, Ripley, and Masham. Of these four parts, if we suppose the entire Riding to be divided into 100, the proportions are 20, 8, 21, and 51 respectively.

The climate of the West Riding is as various as its surface. Towards the banks of the Ouse, it resembles that of the East Riding on the opposite side of the river; and damps and fogs frequently prevail. In the middle district the air becomes clearer and more healthful. On its western margin rains and storms are predominant. At Sheffield the average gage of rain is 33 inches, exceeding the mean between the quantities which fall on the eastern and western coasts respectively. The general average throughout England is stated at 28 inches. Blackstone Edge and the mountains of Craven are the foggiest and most tempestuous districts in England; although, from the high winds which agitate and purify the atmosphere, the climate is salubrious to sound constitutions, and the inhabitants have a robust and healthful appearance.

In the middle and western divisions of the West Riding, are found great quantities of coal, ironstone, and lead, with vast quarries of limestone. This begins at the imaginary line above mentioned, extending from Doncaster to Tadcaster; and, at different depths, pervades almost the whole county westward. The coal mines abound most in the tract between Leeds and Wakefield, and in the neighbourhood of Bradford, Barnesley, and Sheffield; although there is coal likewise in other parts of the Riding. The neighbourhood of Bradford is rich in iron, which often occurs intermixed with coal. The upper coal, however, is, in such cases, of an inferior kind, and sells at little more than half the price of the lower seams. The principal lead mines are at Grassington, about ten miles west of Pately Bridge, in the manor of the duke of Devonshire.

The soil in this extensive district includes almost every variety, from the deep strong clay and rich loam, to the most barren species of peat earth. In the eastern parts the clay and loam preponderate, though occasionally intersected by sandy or moorish tracts. The middle portion consists chiefly of a loam upon a limestone bottom, which prevails, indeed, with the frequent mixture of moorland, to the western extremities of the Riding. Almost all the arable land is inclosed with hedges or stone walls; the former prevailing in the eastern, and the latter in the western parts. Upon these lands, wheat is the general produce; oats, indeed, are cultivated to a considerable extent; but little attention is bestowed upon procuring the best kinds for seed, though in the western districts oatmeal forms the principal food of the lower classes. Fields of rye or peas occur but seldom; and few beans are grown, except upon the strong soils in the vicinity of the Don or the Ouse. The turnip husbandry has been generally adopted throughout the Riding; but the mode of sowing is generally the slovenly one of broadcast, and the plants are imperfectly hoed or cleaned. In the eastern part, and particularly in the tract denominated Marshland, (which lies along the banks of the Ouse, below its junction with the Aire) potatoes form a great object of attention. These, chiefly of the kidney kind, are sent in great quantities by water-carriage to the London market. Flax is also extensively cultivated in the same neighbourhood.

In the wapentake of Barkston Ash, which comprehends the eastern boundary of the West Riding, teazles (a production almost peculiar to this part of the county) are grown to a considerable extent, and are purchased by the cloth-dressers, for the purpose of raising the nap on the cloth, before it is submitted to the operation of the shears: and

liquorice is produced in great perfection, in the deep loamy soil of Pontefract; and though mustard has become a valuable article of cultivation in the Ainsty, it is still deemed to be chiefly the produce of the county of Durham. Craven deservedly ranks high as a grazing district, for its horned cattle; and the sheep of this Riding have been much improved by the introduction of the Dishley breed out of Leicestershire. The horses, however, for which the county has long and justly been celebrated, are principally bred in the East and North Ridings.

Of the oak and ash wood produced in the West Riding, the shipping and manufacturing towns, with the mines and collieries, consume a large proportion; and yet, in the vicinity of Sheffield alone, the duke of Norfolk is supposed to possess not less than 1500 acres of woodland.

This division of Yorkshire may safely be pronounced one of the greatest manufacturing districts in the world. From its local advantages, indeed, it is admirably adapted for that purpose. On every side the raw materials abound; and coals, an article of indispensable necessity, are plentiful and cheap. These manufactures, carried on principally at Leeds, Wakefield, Bradford, Halifax, Huddersfield, and the adjoining country, comprise broad and narrow cloths of all qualities, shalloons, calimancoes, and flannels, with every kind of woollen goods. From Sheffield, cutlery, and plated goods are exported to all parts of the globe. In the vicinity of most of the above places, the soil was originally little better than waste; but from the great increase of population consequent upon the introduction of manufactures, and its invariable accompaniments, abundant manure, and a ready market for produce, the land has been rendered equal in value to that of districts which were naturally much more fertile; and the general face of the country has assumed a totally new aspect.

The West Riding is likewise distinguished for its valuable rivers; the Ouse, the Don, the Calder, the Aire, and the Wharfe. Of these, the first, after receiving several streams below York, meets the Trent from Nottinghamshire, and forms the Humber. The Don is navigable to Sheffield. The Calder, the Still, and the Aire, which unite below Wakefield, and flow into the Ouse, near Armir, furnish access by water-carriage into the western interior of the country: and the swift Wharfe, rising at the foot of the Craven hills, after a course of 50 or 60 miles eastward, pours its tribute into the same river, near New-Appleton. Yorkshire contains, likewise, numerous canals, by which its produce is distributed throughout the kingdom. In addition to the towns above-mentioned, may be named as manufacturing places, Knarborough, Keighley, Barnesley, Rotherham, and Pontefract. The West Riding is divided into ten wapentakes, viz. Osgoldcross, Barkston Ash, Skirack, Strafforth and Tickhill, Staincross, Agbrig, Morley, Claro, Eurcross, and Staincliffe; has five boroughs, Aldborough, Boroughbridge, Ripon, Knarborough, and Pontefract; the number of inhabitants is stated at 800,848.

With respect to the antiquities, military and ecclesiastical, by which Yorkshire is distinguished, York can only boast of two, Clifford's Tower (near the castle), and St. Mary's abbey. But there are castellated ruins at Conisbrough, west of Doncaster, Harewood, Knarborough, Pontefract, Sandal (near Wakefield), Sheffield, and Skipton; and of the 106 now decayed religious houses (viz. 14 abbeys, 44 priories, 7 alien priories, 13 cells, and 28 houses of friars of various orders) enumerated by Boston, in his *Monasticon Eboracense*, the abbeys of Fountain's near Ripon, Kirkstall near Leeds, Bolton in Craven, Rivalx and Byland near Helmsley, and Whitby in the North Riding. To particularise the eminent men born within the circuit of this county, such as Constantine the Great, Wickliffe, archbishop Tillotson, Dr. Bentley, &c. would too widely diffuse an article which has already exceeded our accustomed limits.

YORK SULPHUR SPRINGS, a post village of the United States, in Adams county, Pennsylvania.

YORKTOWN, or YORK, a post town of the United States,

States, a port of entry, and capital of York county, on the south side of York river, which affords at this town the best harbour in Virginia. It is contracted here to the width of a mile, and is inclosed within very high banks, under which the largest vessels may ride with safety. It is a place of some trade. The shipping belonging to this port, in 1816, amounted to 945 tons. This town is famous for the capture of lord Cornwallis and his army by the Americans, on the 19th of October, 1781; 12 miles east-south-east of Williamsburg. Population 700. Lat. 37. 22. N. long. 76. 52. W.

YO-TCHEOU, a city of China, of the first rank, in Hooquang, situated upon the great river Yang-tse-kiang, where it connects with the large lake of Tong-ting. The great trade which this situation secures to it, renders it one of the most populous cities in the empire. The neighbourhood also is very fertile, particularly abounding in every species of fruit. Lat. 29. 23. N. long. 112. 35. E.

YOU, *pron.* [eop, iuh, Sax.; of *ye, ye.*] The oblique case of *ye*.—Ye have heard of the dispensation of the grace of God, which is given me to *you* ward. *Eph.*—It is used in the nominative in common language, when the address is to persons; and though first introduced by corruption, is now established. In the following lines *you* and *ye* are used ungrammatically in the places of each other; but even this use is customary:

What gain *you* by forbidding it to tease *ye*?
It now can neither trouble *ye*, nor please *ye.* *Dryden.*

It is the colloquial word for the second person singular, and is always used, except in solemn language.

In vain *you* tell your parting lover,
You wish fair winds may waft him over. *Prior.*

It is used indefinitely, as the French *on*; any one; whoever.—We passed by what was one of those rivers of burning matter: this looks, at a distance, like a new-plowed land; but as *you* come near it, *you* see nothing but a long heap of heavy disjointed clods. *Addison.*—*You* is used in the subsequent members of a sentence, as distinguished from *ye*.

Stand forth, *ye* champions, who the gauntlet wield,
Or *you* the swiftest racers of the field. *Pope.*

YOU, a town of China, of the third rank, in Tche-kiang.

YOUAN, a town of China, of the third rank, in Kiang-see.

YOUB, EL, a village of Algiers; 50 miles south-west of Tlemsan.

YOUGANE, a river of Asiatic Russia, in the government of Tobolsk, which rises in the district of Narym, and after passing through a lake of the same name, falls into the Obi.

YOUGHALL, a seaport town of Ireland, in the county of Cork, situated on the base of a lofty hill, near the mouth of the Pay, on the south side of the Blackwater river. There is a bar at the entrance of the harbour, which renders navigation troublesome, and sometimes dangerous; but when this obstacle is surmounted, it is safe, spacious, and convenient. The town consists of a very large street, and suburbs. Its custom-house is large and convenient. The collegiate church is a very ancient Gothic structure: its nave is 132 feet long and 66 broad; it has a square tower on the north side, 32 feet high. There are two ruined chapels on each side of the chancel, containing some ancient tombs and monuments. This place was besieged in the year 1579, by the earl of Desmond, in his rebellion in the reign of Elizabeth. In the civil war it yielded to Cromwell's usurpation, who embarked here for England, after his unparalleled successes in Ireland; but in the year 1648 the corporation proclaimed Charles II. king of England, &c. In 1224 a monastery for Franciscans was founded here, by Maurice Fitzgerald, lord justice of Ireland. In 1268 a friary for Dominicans was founded on the north side of the town, of which structure few fragments now remain. Youghall sends one member to the imperial parliament. It was incorporated by king Edward IV. and invested with great privileges, which were confirmed and augmented by succeeding monarchs; notwithstanding which it would probably have sunk into

decay, if the first and great earl of Cork, to whom the province of Munster in general, and this county in particular, owe so many obligations, had not interposed, preserved, and restored it. Here the first potatoe is said to have been planted in Ireland; 31 miles south-west of Waterford, and 25 east of Cork.

YOULGRAVE, a parish of England, in Derbyshire. Population 852.

YOULHORPE, a hamlet of England, in Yorkshire; 5 miles north-west of Pocklington.

YOUNG, *adj.* [iong, yeong, Sax.; jong, Dutch; ung, Su. Goth. and Icel. *jugga*, (i. e. *junga*.) M. Goth.] Being in the first part of life; not old: used of animal life.

There's not the smallest orb which thou behold'st,
But in his motion like an angel sings,
Still quiring to the *young*-ey'd cherubims. *Shakspeare.*

Ignorant; weak.—Come, elder brother, thou art too *young* in this. *Shakspeare.*—It is sometimes applied to vegetable life.—There be trees that bear best when they begin to be old, as almonds; the cause is, for that all trees that bear must have an oily fruit, and *young* trees have a more watery juice, and less concocted. *Bacon.*

YOUNG, *s.* The offspring of animals collectively.

The hedge-sparrow fed the cuckoo so long,
That it had its head bit off by its *young.* *Shakspeare.*

YOUNG (Edward), a celebrated poet and clergyman of the established church, was born at his father's living of Upham, in Hampshire, in 1684, and removed from Winchester school to New College, in the university of Oxford, in 1703, and afterwards to Corpus Christi college. In 1708 he obtained a law-fellowship at All Souls by the patronage of archbishop Tenison, and at this time poetry was the chief object of his pursuit. His first performance in this department was "An Epistle to Lord Lansdown," one of the twelve peers created at the same time in 1712; and this was followed in the next year by his "Last Day," to which he prefixed a dedication to queen Anne, extolling the peace of Utrecht. From this circumstance he was regarded as a court-writer with a fixed stipend, under which character Swift alludes to him in his "Rhapsody on Poetry:"

"Where Y—— must torture his invention
To flatter knaves, or lose his pension."

His next production was "The Force of Religion, or Vanquished Love," founded on the story of lady Jane Grey; and in 1714 he inscribed a poem on the death of the queen and the accession of George I. to Addison, who was then secretary to the lords justices. In 1719 he became tutor to the eldest son of the earl of Exeter; but soon abandoning that connection by the solicitations of the duke of Wharton, he graduated doctor of civil laws in this year, and wrote his tragedy of "Busiris, King of Egypt," which was dedicated to the duke of Newcastle, and favourably received; and in the same year he dedicated, in a very complimentary strain to lord chancellor Parker, his poetical "Paraphrase on Part of the Book of Job." In the year 1721 his tragedy, "The Revenge," was exhibited with great applause, and dedicated to the duke of Wharton, whom he avows as his peculiar patron, and from whom he received some pecuniary favours. His satires, entitled "The Love of Fame, or the Universal Passion," were separately published, from 1725 to 1728, and as they became popular, he derived from them considerable profit. In 1726 he addressed his poem, entitled "The Instalment," to Sir Robert Walpole, on his receiving the honour of the Garter; and he availed himself, on the accession of king George II., of his recommending an attention to the navy, to compose two odes, one inscribed "To the King, Pater Patriæ," introducing another under the title of "Ocean." Having attained his 44th year, he took orders, and in 1728 was nominated one of the royal chaplains; and this change of his views and pursuits induced him to withdraw from the stage his tragedy of "The Brothers," which was under rehearsal. His next publications were adapted to his new profession; and among these were his "True Estimate of Human

Human Life," exhibiting the dark side of the picture; and a sermon preached before the house of commons on the 30th of January, entitled "An Apology for Princes, or the Reverence due to Government;" a subject not unappropriate to his situation as royal chaplain. In 1730, Dr. Young was presented by his college to the rectory of Welwyn, in Hertfordshire; and in the following year he married lady Elizabeth Lee, widow of colonel Lee, and daughter of the earl of Lichfield. Before this time he had resumed his poetical pen, and written "Imperium Pelagi, a Naval Lyric;" "Two Epistles to Mr. Pope, concerning the Authors of the Age;" and "The Sea-Piece," in two odes, dedicated to Voltaire. By his wife, who died in 1741, he had one son; and this circumstance, together with some other domestic losses that occurred about the same period, increased that melancholy and depression of mind to which he was constitutionally inclined. When he married lady Lee, she had a son, and also two daughters, the eldest of whom, denominated by him Narcissa, falling into a decline, went to the south of France, and died at Lyons in 1736. Her husband, Mr. Temple, supposed to be the poet's Philander, died in 1740; and his own lady died in 1741. If he referred to these events in the annexed lines, he must have taken a chronological licence hardly allowable even to a poet:

"Insatiate archer! could not one suffice?
Thy shaft flew *thrice*, and *thrice* my peace was slain;
And *thrice*, ere *thrice* yon moon had filled her horn."

It is certain that he began to write his "Night Thoughts" in the year 1741; and the occasion, as he declares, was real, and not fictitious. The seventh of these poems is dated in 1744, and the interval must have been occupied in the composition of them. Notwithstanding the sublime strains in which the author expresses his pious feeling, he is not regardless of the patronage of distinguished persons, for to such he inscribes them. On this work Dr. Young bestowed much attention and labour, and he valued it as the chief of his productions. Among his other works we may mention a poem written as an expression of his loyalty in 1745, and entitled "Some Thoughts occasioned by the present Juncture, inscribed to the duke of Newcastle;" "The Centaur not fabulous, in Six Letters to a Friend, on the Life in Vogue," an overcharged picture of the existing manners; and "A Sermon preached before their Majesties," with a dedication to the king, 1758. Dr. Young, notwithstanding his genius and piety, and his solicitude to obtain preferment, seems to have been disregarded; and though archbishop Secker expresses his surprise that he had been overlooked by persons in power, he declines any interference in his favour. It should be recollected, however, that the attention which he paid to Frederick, prince of Wales, during his variance with his father, was not forgotten; nor indeed would his junction of the poetical and clerical character be any recommendation to George II. But the reason of his name's being struck out of the list of court-chaplains on the accession of his late majesty is not known; it is the more unaccountable, as he was soon after appointed clerk of the closet to the princess dowager of Wales.

In his retreat at Welwyn he maintained a respectable and dignified character; and though the cast of his mind seems to have been gloomy, he was an agreeable and lively companion. The close of his life, however, was rather disconsolate than cheerful. The conduct of his only son, supposed to be the Lorenzo of the Night Thoughts, who is said to have been a rake and free-thinker, afforded him renewed opportunities for reproof and sarcasm, and must have been the occasion of poignant grief; though Mr. H. Croft vindicates his character, alleging that he was only eight years old when his father began that poem. But others have asserted that he was alarmed and grieved on his account; and that, notwithstanding the favourable change which took place in his sentiments and character, his father would not admit him to any interview in his latter years: and even on his death-bed he refused to see him, though he assured him of his forgiveness, and made him his heir. Towards the

close of his life, he surrendered himself to the influence of a housekeeper, and from some mismanagement in his concerns, and a growing disposition to avarice, he became irritable in temper and depressed in spirits. His last production was a poem, entitled "Resignation," printed in 1762, which indicated the decline of his mental powers. His life was prolonged to the year 1765, and he then died in his 84th year. He was interred in the church of Welwyn, and his son erected a monument near the remains of both his parents.

Dr. Young is known principally, if not wholly, as a poet; and his compositions in this department are distributed into satires, tragedies, and night thoughts. His satires are founded on the questionable principle, that the love of fame is the universal passion of mankind; and as he did not excel in judgment, they are exercises of wit and invention rather than grave exposures of vice and folly. As a dramatic writer, he is charged with not understanding or not adhering to nature, and with indulging his imagination and feeling, and running into exaggeration of character and bombast of expression. The only tragedy that has kept possession of the stage is his "Revenge," the Zanga of which is said to have no competitor for theatric effect among the personages of modern tragedies. His "Night Thoughts" are deemed original in design and execution. Whatever were the causes that produced them, they are adapted to excite devout feeling, and to produce moral effect, though they are justly complained of as in some places unintelligible, and as affording too much scope for criticism. To many readers, the theology on which they are founded and which they express is too awful and severe, and not so well calculated to sooth and pacify the human mind under trouble as the gentler and more consolatory dictates of Christianity. They are sometimes tedious and prolix. They will never be neglected as long as taste and susceptibility of virtuous and religious impressions remain. The lyric attempts of Dr. Young are said to have been singularly unfortunate. From the edition of his works published in his lifetime in 4 vols. 8vo., he himself excluded several compositions which he thought of inferior merit. *Biog. Brit. Croft's Life of Young in Johnson's English Poets. Gen. Biog.*

YOUNG (Patrick), (*Patricius Junius*, Lat.), an eminent scholar, was born in 1584, at the seat of his father, Sir Peter Young, who had been co-tutor with Buchanan to James VI. of Scotland, at Seaton in Lothian. Educated in the university of St. Andrew's, and accompanying his father in the suite of King James, he was employed for some time as librarian and secretary, by Dr. Lloyd, bishop of Chester. In 1605 he assumed the degree of M.A. which he had before taken at St. Andrew's, and entering into orders, became chaplain at All Souls' college. During his residence at Oxford he occupied himself in the study of ecclesiastical history and antiquities, and also the Greek language; and upon his removal to London, he obtained a pension of 50*l.* a year, and was occasionally employed by the king and persons in power in writing Latin letters. His patron was Montagu, bishop of Bath and Wells, who procured for him the appointment of librarian to the king. In 1617 he was introduced at Paris, by the recommendation of Camden, to the learned men of that city; and upon his return, he assisted Thomas Rhead in making a Latin version of the works of King James. In 1620 he married, and afterwards was advanced to several preferments in the church; and succeeded Rhead in 1624 as Latin secretary. Unknown by any publication, he was nevertheless honoured as a person of distinguished literature, who rendered acceptable and useful services to learned men. In this way, he was the coadjutor of Selden in the examination of the Arundelian marbles; and when they were published by this celebrated antiquary, he dedicated the work to Young. He was also employed in collating the Alexandrian MS. of the Bible with other copies; and as the result of his labours, he communicated many various readings to Grotius, Usher, and other persons. It was his intention to have edited a fac-simile of this MS., but his design was never executed. He published, however, in 1633, from this MS. the "Epistles of Clemens Romanus," and he proposed editing the curious MSS.

MSS. from the king's library; but the civil wars, and the seizure of the royal library, prevented the accomplishment of his purpose. During the troubles of this period, he sought an asylum with a son-in-law, at Bromfield in Essex, where he died in 1652.

Young is said to have indulged to excess a disposition to oblige, which led him to lend valuable MSS. belonging to the royal library to foreigners and others; and he has been charged with betraying his trust, by not returning MSS. which he removed to his own house in contemplation of the pillage of the library, and these were sold among his other effects. To obviate this imputation, it has been alleged that he purchased for himself many MSS. from Greeks who visited this country.—*Smith's Vit. Erudit. Viror. Gen. Biog.*

YOUNG, CAPE, a cape on the north coast of Chatham island, in the South Pacific ocean. Lat. 43. 48. S. long. 183. 2. E.

YOUNG'S ISLAND, a small island near the south coast of the island of St. Vincent; 2 miles south-east of Kingston bay.

YOUNG NICK'S HEAD, a cape on the east coast of New Zealand, so called from Nicholas Young, a boy on board the Endeavour, who discovered it in 1769. It forms the south-west point of Poverty Bay.

YOUNG POINT, a cape on the east coast of St. Vincent. Lat. 13. 12. N. long. 61. 9. W.

YOUNG POINT, a cape on the north coast of Admiralty island, in the North Pacific ocean. Lat. 58. 11. N. long. 225. 33. E.

YOUNGISH, *adj.* Somewhat young.—She let her second room to a very genteel *youngish* man. *Tatler.*

YOUNGLING, *s.* [*yeonglmz*, Saxon.] Any creature in the first part of life.

Youngling, thou canst not love so dear as I.—
—Grey beard, thy love doth freeze. *Shakspeare.*

YOUNGLY, *adj.* Youthful.—Look what ladies and gentlewomen be most fruitful, and have most children, if they look not for their age most *youngly*, best coloured, and be clearest from diseases. *Sir T. Smith.*

YOUNGLY, *adv.* Early in life.

Say we read lectures to you,
How *youngly* he began to serve his country,
How long continu'd, and what stock he springs of.
Shakspeare.

Ignorantly; weakly.

YOUNGSTER, *s.* A young person; in contempt.

Fame tells, by age fame reverend grown,
That Phœbus gave his chariot to his son;
And whilst the *youngster* from the path declines,
Admiring the strange beauty of the signs,
Proud of his charge, he drove the fiery horse,
And would outdo his father in his course. *Creech.*

YOUNGSTOWN, a post village of the United States, in Cambria, New York; 1 mile south of Fort Niagara.

YOUNGSTOWN, a post township of the United States, in Pennsylvania.

YOUNGSTOWN, a post township of the United States, in Trumbull county Ohio, on the Mahoning. It is considerable and flourishing. Population 773.

YOUNGSVILLE, a post village of the United States, in Sumpter district, South Carolina.

YOUNGTH, *s.* Youth. *Obsolete.*

The mournful muse in mirth now list ne mask,
As she was wont in *youngth* and summer days. *Spenser.*

YOUR, *pronoun.* [*eopej*, Sax.] Belonging to you. It is used properly when we speak to more than one, and customarily when to only one.—Either *your* unparagoned mistress is dead, or she's outprized by a trifle. *Shakspeare.*

Impute *your* danger to our ignorance;
The bravest men are subject most to chance. *Dryden.*

Ye dauntless Dardans hear,
Think on the strength which once *your* fathers bore. *Pope.*

VOL. XXIV. No. 1673.

Your is used in an indeterminate sense.—There is a great affinity between coins and poetry, and *your* medallist and critic are much nearer related than the world imagine. *Addison.*—*Yours* is used when the substantive goes before or is understood; as, this is *your* book, this book is *yours*.

Pray for this man and for his issue,
Whose heavy hand hath bow'd you to the grave,
And beggar'd *yours* for ever. *Shakspeare.*

YOURI, a town of Cashna, in Central Africa, upon the caravan route to the Niger.

YOURSELF, *s.* You, even you; ye, not others.

If it stand as *you yourself* still do,
Within the eye of honour; be assur'd,
My purse, my person, my extremest means,
Lie all unlock'd to your occasions. *Shakspeare.*

In the oblique cases it has the sense of reciprocity, or reference to the same subject mentioned before; as, you love only *yourself*: you have betrayed *yourselves* by your rashness.—Whenever you are more intent upon adorning your persons, than upon perfecting of your souls, you are much more beside *yourselves*, than he that had rather have a laced coat than a healthful body. *Law.*—It is sometimes reciprocal in the nominative.—Be but *yourselves*. *Pope.*

YOUTH, *s.* [*yeozuð*, Sax.] The part of life succeeding to childhood and adolescence; the time from fourteen to twenty-eight.

But could *youth* last, and love still breed,
Had joys no date, and age no need;
Then these delights my mind might move,
To live with thee, and be thy love. *Raleigh.*

A young man.

Siward's son,
And many unrough *youths* even now,
Protest their first of manhood. *Shakspeare.*

Young men. Collectively.—As it is fit to read the best authors to *youth* first, so let them be of the openest and clearest; as Livy before Sallust, Sidney before Donne. *B. Jonson.*

About him exercis'd heroic games
The unarmed *youth* of heaven. *Milton.*

YOUTHFUL, *adj.* Young.
Our army is dispers'd already:
Like *youthful* steers unyok'd they took their course,
East, west, north, south. *Shakspeare.*

Suitable to the first part of life.
The nymph surveys him, and beholds the grace
Of charming features, and a *youthful* face. *Pope.*

Vigorous as in youth.—How is a good Christian animated by a steadfast belief of an everlasting enjoyment of perfect felicity, such as, after millions of millions of ages is still *youthful* and flourishing, and inviting as at the first? no wrinkles in the face, no grey hairs on the head of eternity. *Bentley.*

YOUTHFULLY, *adv.* In a youthful manner.
YOUTHLY, *adj.* Young; early in life. *Obsolete.*

True be thy words, and worthy of thy praise,
That warlike feats dost highly glorify,
Therein have I spent all my *youthly* days,
And many battles fought and many frays. *Spenser.*

YOUTHY, *adj.* Young; youthful. *A bad word.*—The scribbler had not genius to turn my age, as indeed I am an old maid, into raiillery, for affecting a *youthier* turn than is consistent with my time of day. *Spectator.*

YOWRY, a small island in the Eastern seas, near the north coast of New Guinea, on which a nutmeg-tree was found growing, by captain Forrest. Lat. 0. 15. S. long. 130. 45. E.

YOX, or YAUGH GLADES, a post village of the United States, in Allegany county, Maryland.

YOXALL, a parish of England, formerly a market town

in Staffordshire; 6 miles north-north-east of Lichfield. Population 1345.

YOXFORD, a parish of England, in Suffolk; 25 miles north-east of Ipswich. Population 1007.

YOXHIOGENY, or YOUGHIOGENY, a river of the United States, in Pennsylvania, which rises in Virginia, and runs north-north-west into the Monongahela; 15 miles south-east of Pittsburg.

YPACARY, a lake of South America, formed by the overflowing waters of the Paraguay, in Lat. 25. 23. S.

YPANE, or IPANE, an Indian settlement of Paraguay, on the east bank of the Paraguay, about 8 miles south-east of Assumption. Lat. 25. 27. S. long. 57. 33. E.

YRIARTE (Don John de), was born in the Isle of Teneriffe in 1702, and having completed his education at Paris and Rouen, settled at Madrid; where he occupied several literary offices, and particularly that of librarian to the king. His life terminated, to the regret of those who knew his worth, in 1771. Among his learned works, the principal are, "Palæographia Græca," 4to.; "Miscellaneous Pieces in Spanish, with Latin Poems," 2 vols. 4to.; "A Catalogue of Greek MSS. in the Royal Library;" and "A Catalogue of Arabic MSS. in the Escorial," 2 vols. fol.—*Now. Dict. Hist.*

YPIGHT, *part.* [*y* and *pitch*, from *pitch*.] Fixed.

That same wicked wight
His dwelling has low in an hollow cave,
Far underneath a craggy clift *ypight*,
Dark, doleful, dreary, like a greedy grave. *Spenser.*

YPRES, a considerable town of the Netherlands, in West Flanders, situated on a plain, on the small river Yperle. Though an inland town, it has, like most towns in France, the advantage of water communication, being connected by a canal with Bruges, Ostend, and Nieuport. It is fortified, and, on the whole, well built. Its chief structures are the town-hall, built in the Gothic style, an elegant cathedral, and other churches, which contain, as usual in Belgium, good paintings. The other buildings are the exchange, the chamber of commerce, and the college or public school. Ypres has a population of 15,500, and was noted in former ages for its woollen manufactures: at present these are superseded by linen, lace, cotton, thread, and, in a small degree, by silk. It has two annual fairs, held respectively in the beginning of May and August. In 1793 and 1794 this town was exposed to a bombardment from both French and allies; it fell eventually into the power of the former, and remained in their hands until the overthrow of Bonaparte in 1814; 20 miles south of Ostend. Lat. 50. 51. N. long. 25. 3. E.

YQUAMANDIZU, a parish of Paraguay. Lat. 24. 6. S. long. 56. 58. W.

YQUILAO, an island on the west coast of South America south of the islands of Chiloe, visited annually by the Indians, who put cows in them, for the sake of the pasture.

YRAME, a village of Yemen, in Arabia; 100 miles north-north-east of Aden.

YRIEIX, *St.*, a town of France, in the department of the Upper Vienne. It is situated on the small river Loue, near its source; has five churches, an hospital, and 5000 inhabitants. It has manufactures of linen, druggets, flannel, hats, and leather; likewise of stone-ware and iron-works. Here are mines of antimony; and in the neighbourhood, the finest species of porcelain earth used in the manufactures of Sevres; 20 miles south-by-west of Limoges, and 30 north-east of Perigueux.

YSCAR, a town of Spain, in Old Castile; 30 miles north-north-west of Segovia. Population 8000.

YSCHÉ, a small river of the Netherlands, in Brabant, which rises in the forest of Soignies, and falls into the Dyle.

YSENDIEK, a town of the Netherlands, in Zealand, situated on a canal which joins the Western Scheldt; 10 miles east of Sluys. Population 600.

YSIDRO, *St.*, a parish of the province of Buenos Ayres on the shore of La Plata; 15 miles north of Buenos Ayres. Lat. 34. 28. S. long. 58. 23. W.

YSSÉLOO, an inland town of the Netherlands, in Overijssel. Population 1100.

YSSENGEAUX, an inland town of the south-east of France, in Auvergne, department of the Upper Loire; 14 miles north-east of Le Puy, 25 south-west of St. Etienne, and 286 north-east of Paris. It contains no remarkable object, and no manufactures worth notice. The culture of the vicinity forms the principal employment, and cattle dealing the chief branch of traffic among the inhabitants. Population 6300.

YSTADT, a town of the south of Sweden, in the province of Schonen, on the Baltic, with 2700 inhabitants. The harbour is small and insecure; but a new one now in progress, is expected to be more commodious. Its chief intercourse being with Germany, that language is generally spoken and understood here. Ystadt was once a place of strength, but is now unfortified. It has two churches and is situated 35 miles east-south-east of Malmoe, and 46 south-south-west of Christianstadt. Lat. 55. 25. 31. N. long. 13. 48. 30. E.

YTA, or ITA, a settlement of Indians of the province and government of Paraguay; situated a little from the east bank of the Paraguay, about 20 miles south-east from Asuncion. Lat. 25. 30. 30. S. long. 57. 25. 2. W.

YTANGUA, a parish of the province and government of Paraguay. Lat. 25. 24. 44. S. long. 57. 24. 6. W.

YTAPUA, or ITAPUA, a settlement of Indians in the province and government of Paraguay, situated on the north bank of the Parana, about five miles north-west from Candelario. Lat. 27. 20. 16. S. long. 55. 52. 59. W.

YTATY, or ITATY, a settlement of Indians in the province and government of Buenos Ayres, situated on the Parana, about 20 miles north-east of Corrientes. Lat. 27. 17. S. long. 58. 11. 38. W.

Y-TCHANG, a town of Corea; 35 miles west-north-west of Kang-tcheou.

Y-TCHANG, a town of China of the third rank, in Hooquang.

Y-TCHIN, a town of China, of the third rank, in Chan-si; 30 miles south of Pinyang.

Y-TCHING, a town of China, of the third rank, in Hooquang.

Y-TCHING, a town of China, of the third rank, in Kiang-nan.

Y-TCHUEN, a town of Corea; 15 miles south-south-west of Ou-tcheou.

Y-TCHUEN, a town of Corea; 55 miles north of King-ki-tao.

YTHAN, or ITHAN, a river of Scotland, in Aberdeenshire, which rises in the hills of the parish of Forgue, and, after a course of about 30 miles, being augmented about 12 miles from its source by the Gight, it falls into the sea at the small village of Newburgh, in the parish of Foveran. It is navigable for three miles, as far as Ellon; and vessels of 100 or 150 tons burden can come a mile up. It possesses a salmon fishing of considerable value; but is chiefly noted for the large pearls which its muscles produce, some of which have been sold so high as 3*l.* sterling.

Y-TON, a town of China, of the third rank, in Hooquang, on the river Yangtse.

YTEROE, an island of Sweden, in the Baltic, on the coast of Carlserona, among the Skares (islands on the coast) of Blaking.

YU, a river of China, which rises in Honan; 12 miles north of Pi-yang, and joins the Hoai, 20 miles east-south-east of Sin-tsai.

YU, a river of China, which rises about 26 miles west from Ngan-fou, in Kiang-see, and runs into the Kan-kiang; 7 miles north-north-east of Lin-kiang.

YU, a town of China, of the third rank, in Chan-si.

YU, a city of China, of the second rank, in Pee-che-lee. Lat. 39. 52. N. long. 114. 14. E.

YU, a city of China, of the second rank, in Honan. Lat. 33. 22. N. long. 112. 38. E.

YU, a city of China of the second rank, in Honan. Lat. 34. 16. N. long. 113. 14. E.

YUBAL, a settlement of Quito, in the province of Cuenca.

YUCA, a large settlement of New Granada, in the province of Velez, containing 700 housekeepers, and 60 Indians; 20 miles north of Santa Fe.

YUCA, a small river of St. Domingo, which rises very near the south coast, runs south, and enters the ocean.

YUCAL, a settlement of New Granada, in the province of Carthagena, on the shore of the Magdalena.

YUCATAN, the most easterly province of New Spain. It is in the form of a peninsula, jutting out into the gulf of Mexico from the mainland of the isthmus. It is surrounded on the north-west by the waters of the Mexican gulf, by the bay or gulf of Honduras on the south-east, the province of Vera Cruz bounds it on the south-west, and Vera Paz in Guatemala on the south. Here it is connected with the continent of North America, by an isthmus of about 120 miles in breadth. The English have settlements extending a short distance along the east coast of Yucatan, opposite Ambergris Key. The soil of this peninsula is very prolific, and, when under proper cultivation, produces great crops of corn, maize, indigo, and cotton. The climate is hot, their summer beginning in April, and finishing in September; but January and February are very warm months, the rest of the winter cooler, and little or no rain falls throughout that season. The north side is the pleasantest; for, although very hot, it is refreshed by gentle breezes; on the whole, the climate of Yucatan is not an unhealthy one. It produces and sustains vast quantities of cattle, fowls, and bees; honey and wax are therefore plenty; and its forests afford shelter to various kinds of wild beasts. It has no mines, for which reason it is not much settled by the whites, the chief part of its inhabitants being Indians, who are employed in making salt in Campeachy bay, and are subject to the Spaniards. On the coasts of Yucatan, large pieces of amber are frequently found. A ridge of considerable mountains pervades the whole extent of this province, which extends from the eastern side at Merida, to the western extremity of the peninsula. On this range of mountains the climate is very fine, and it is asserted that the natives live to a great age. On the north side of this chain the land is refreshed with breezes, and contains plenty of springs; but the southern side is in want of good water, ill cultivated, and thinly peopled, the settlers being chiefly on the north. In Merida the nights and days are nearly of a length, owing to its situation. In Yucatan there are very few rivers of any consequence, but springs are numerous, especially on the north side; and in digging for their wells, in which they always find water at a little depth, shells are usually found, from which, with the shallowness of the sea near the coast, it has been supposed that the greater part of the peninsula was once submerged. The eastern coast of Yucatan is not inhabited by Spanish colonists, the English alone appearing there, except in the small fort of Bacalar, which has been built to prevent the British from going into the interior. The British logwood cutters find that article in greatest perfection in Campeachy bay, and in the bay of Honduras; but it has been said that the logwood of Campeachy is more plentiful, as well as greatly superior to that of Honduras. The chief towns are Campeachy, or St. Francisco de Campeche Merida de Yucatan, and Valladolid. Here are, besides, some Indian villages. The logwood cutting establishments are under the Spanish governor; but by the treaty of peace in 1783, the British were allowed the privilege of cutting it without being molested. The wood is felled at stated seasons, and in stated places, by permission of the intendant, and is dried for a year previous to exportation. This wood is not confined to Yucatan; it grows in abundance on the coast of South America, near the mouths of the Orinoco. Population, including the Indians, 465,800.

YUCAY, SANTIAGO DE, a settlement of Peru, in the province of Urubamba.

YUCCA, in Botany, a genus of the class hexandria, order monogynia, natural order of coronariæ, lilia (*Juss.*)—Ge-

neric character. Calyx none. Corolla: bell-shaped, six-parted, cohering by the claws; segments ovate, very large, spreading. Stamina: filaments six, very short, thicker above, reflexed. Anthers very small. Pistil: germ oblong, bluntly three-sided, longer than the stamens. Style none. Stigma three-grooved, obtuse, with bifid segments, pervious. Pericarp: berry oblong, obscurely six-cornered, fleshy, punched with a little hole between the stigmas, six-celled; partitions three thicker, and three thinner, and membranaceous diaphragms forming cells for each seed. Seeds: flattish, incumbent, fastened to the inner angle of each cell.—*Essential Character.* Corolla: bell-shaped, spreading. Style none. Capsule three-celled.

1. *Yucca gloriosa*, or superb Adam's needle.—Leaves quite entire. This seldom rises with a stem above two feet and a half or three feet high, which has leaves almost to the ground. These are broad, stiff, and have the appearance of those of the Aloe, but are narrower; they are of a dark green colour, and end in a sharp black spine. It frequently produces its panicles of flowers from the centre of the leaves. They appear in August and September, but are not succeeded by seeds in England.—Native of Virginia and other parts of North America.

2. *Yucca aloifolia*, or aloe-leaved Adam's needle.—Leaves crenulate, strict. This rises with a thick, tough, fleshy stalk, to the height of ten or twelve feet, having a head or tuft of the leaves at the top; these are narrower and stiffer than those of the former sort, and are of a lighter green colour; their edges are slightly serrate, and their points end in sharp thorns. The flower-stalk rises in the centre of the leaves, and is from two to three feet long, branching out into a pyramidal form.—Native of South America.

3. *Yucca draconis*, or drooping-leaved Adam's needle.—Leaves crenate, nodding. Stalks three or four feet high.—Native of South Carolina.

4. *Yucca filamentosa*, or thready Adam's needle.—Leaves serrate-thready.—Native of Virginia.

Propagation and Culture.—All these plants are either propagated by seed, when obtained from abroad, or else from offsets or heads taken from the old plants, after the manner of Aloes.

To YUCK, *v. n.* [*jeucken*, Dutch.] To itch. *Grose calls it a Lincolnshire word.*

YU-CHAN, a town of China, of the third rank, in Kiang-see.

YUCUL, a settlement of Peru, in the province of Chan-cay.

YUE, a town of China, of the second rank, in Yunan. Lat. 25. 22. N. long. 103. 22. E.

YUEN, a river of China, which runs into the lake Tongting.

YUEN, a city of China, of the second rank, in Hooquang. Lat. 27. 23. N. long. 109. E.

YUEN-CHAN, a town of China, of the third rank, in Kiang-see.

YUEN-CHE, a town of China, of the third rank, in Pechee-lee.

YUEN-KIANG, a city of China, of the first rank, in Yunan, on the Hoti river, in a mountainous but fertile country, abounding with silk and areca. Lat. 23. 37. N. long. 101. 44. E.

YUEN-MEOU, a town of China, of the third rank, in Yunan.

YUEN-OU, a town of China, of the third rank, in Honan.

YUEN-SI, a town of China, of the third rank, in Hooquang.

YUEN-TCHEOU, a city of China, of the first rank, in Kiang-see, on the borders of an agreeable little lake. Its district produces alum and vitriol. Lat. 27. 50. N. long. 114. E.

YUEN-YANG, a city of China, of the first rank, in Hooquang, on the river Han, and in a plain encompassed by mountains, in which tin is found; 517 miles south-south-west of Pekin. Lat. 32. 50. N. long. 110. 29. E.

YVERDUN, a small town of the Swiss canton of Vaud, at the

the south extremity of the lake of Neufchatel, where the Orbe flows into the lake. It is beautifully situated; and the roads leading to it form alleys of trees, for a considerable distance from the gates. The town itself is neatly built, contains 2500 inhabitants, and has a brisk traffic, chiefly in the transit of goods; an advantage owing to its command of water carriage, boats going from it to the Rhine, by the lakes of Neufchatel and Biemme, the river Thiel, and the Aar. A canal, in the direction of the lake of Geneva, was begun in the middle of the 17th century, but it has never been finished. This little place has a public library, with a collection of natural history and Roman antiquities. It is also of some note for painting, and is the seat of the well known school of Pestalozzi; 38 miles west-south-west of Berne, and 48 north-north-east of Geneva.

YVES, or Ivo, bishop of Chartres, was born in the 11th century, of a noble family, in the territory of Beauvais, and studied theology under Lanfranc, prior of Bec. Being made abbot of St. Quentin, he opened a theological school, which became famous; and having superintended this institution for fourteen or fifteen years, and maintained a regularity among those who attended it conformable to the ancient canons, he was justly regarded as one of the chief founders of the order of canons-regular. Upon the death of Geoffrey, bishop of Chartres, he was chosen as his successor, and the election was confirmed by Urban II. in 1091. The discipline he maintained in his see was exemplary, and in the duties of it he was employed for 25 years, his episcopate and his life terminating in 1116. Besides sermons, a brief chronicle of the kings of France, and two collections of ecclesiastical decrees, he has left 287 epistles, from which may be learned the manners of the times in which he lived. Of these we have a summary by Dupin. A collection of his works was printed at Paris in 1647. His name is highly respected in the church of Rome, and pope Pius V. issued a bull in 1570, empowering the canons-regular of Latran to celebrate an anniversary for "the blessed Yves."—*Dupin. Moreri.*

YVETOT, an inland town of France, in Normandy, department of the Lower Seine; 22 miles north-west of Rouen. It is situated on the highest point of a ridge of hills, so that water is scarce; but the surrounding country is fertile in corn, and produces abundance of apples, of which cyder is made. It contains nearly 10,000 inhabitants, who have all the characteristic industry of Normans, and manufacture large quantities of linen, muslins, druggets, dimities, and different kinds of knitting.

YVETTE, a small river in the north of France, department of the Seine and Oise, which rises near St. Hubert, and falls into the Orge at Savigny. In 1787 a canal was begun, to conduct its waters to Paris.

YUHUARI, a river of the extensive plains of South America which border the great river Amazons, of which it is a tributary.

YUINEIMA, a river of Paraguay, which runs east, collecting the waters of many other rivers, and runs into the Parana.

YUIPA, a small river of Paraguay, in South America, which runs north-north-west, and enters the Uruguay.

YUISPIN, an Indian settlement of the province of Buenos Ayres, on a branch of the Parana. Lat. 29. 43. S. long. 60. 20. W.

YULE, *s.* [*jul*, Su. Goth.; *jule*, Dan.; *jol*, Icel.; *zehul*, *zeola*, Saxon. Dr. Jamieson agrees with Mr. Pinkerton in tracing it to one of the three great religious festivals in the year, which the ancient Goths observed; namely *Yule*, or *Jul*, celebrated at the time of the winter-solstice, in honour of the sun. See Dr. Jamieson, in *V. YULE*. Hammond refers it to the Lat. *jubilum*. The Welsh *wyl*, or *gwyl*, it may be added, is a holiday; and the Cimbr. *ol* signifies a feast. *Todd.*] A word adopted, and formerly much in use, for the times of Christmas and Lammas.—This is the original *yule*—the other the *yule* of August determinately. *Hammond.*—Masks, singing, dancing, *yule*-games. *Burton.*—The misletoe ceremonial of the *yule* festival continued from the time of the Druids. *Stukeley.*

YU-KANG, a town of China, of the third rank, in Kiang-see.

YU-KAO, a town of China, of the third rank, in Kiangnan.

YU-KING, a town of China, of the third rank, in Koei-tchoo.

YU-LON, a town of China, of the third rank, in Chan-si.

YUMA, YUMBA, or LONG ISLAND, one of the Bahama Islands, about 50 miles in length, of very unequal breadth. Lat. 23. 20. N. long. 74. 50. W. It lies north of the island of Cuba, and was discovered by Columbus.

YUMBA BAY, a bay on the south coast of the island of St. Domingo, between the island of Saona, and the point of Espada.

YUMBEL, a settlement of Chili, in the province of Itata.

YUMBO, a settlement of New Granada, in the province of Popayan.

YUME, a river of the country which borders the Amazons. It runs east, and enters the Amazons.

YUMETOS, a cluster of small islands among the Bahama islands, about 20 miles south-west of Yuma.

YUMSONG, a small island near the coast of China. Lat. 31. 42. N. long. 121. 17. E.

YUN, a city of China, of the second rank, in Yunan. Lat. 24. 32. N. long. 99. 35. E.

YUNA, a large river of St. Domingo, which rises in the mountains of the centre of the island, runs to the north-north-east, and, near the town of Cotuy, turns its course to south-south-east, and enters the sea in the bay of Samana, forming several islands at its mouth.

YUNAN, a province of China, situated on its south-western frontier. It is bounded on the north by Sechuen and Thibet, on the east by Quang-see and Koei-tchoo, on the south by Laos, and on the west by Ava and Pegu; about 300 miles in length, and 250 in breadth. This province, though mountainous, is reckoned one of the most fertile and opulent in China. It is well watered by rivers and lakes. The inhabitants are brave, robust, affable, and fond of the sciences, which they cultivate with success. It produces gold, copper, and tin mines; amber, rubies, sapphires, agates, pearls, precious stones, marble, musk, silk, elephants, horses, gums, medicinal plants, and linen. Its commerce, is immense. This province contains 21 cities of the first class, and 55 of the second and third. Sir George Staunton estimates the population at eight millions.

YUNAN, a town of China, of the third rank, in Yunan.

YUNAN, a city of China, of the first rank, and capital of the province of the same name, situated at the northern extremity of a large and deep lake. It was formerly celebrated for its extent, and the beauty of its public edifices. Here were seen magnificent buildings, vast gardens, tombs, triumphal arches, and elegant squares; but the Tartars, in their different invasions, destroyed all these monuments; and the city at present contains nothing remarkable: it is, however, the residence of the governor of the province. Lat. 25. 6. N. long. 102. 28. E.

YUNDUZA, SANTA CRUZ DE, a settlement of Mexico, in the intendency of Puebla, containing 116 families of Indians.

YUNG, a town of China, of the third rank, in Quangsee.

YUNGA, a settlement of Peru, in the province of Conchucos.

YUNGAI, a settlement of Peru, in the province of Huailas.

YUNGAR, a river of Louisiana, which derives its name from the vast number of springs at its source. It is navigable for canoes 100 miles, and is celebrated for the abundance of bears which are found on its branches.

YUNG-FOU, a town of China, of the third rank, in Quangsee.

YUNG-HO, a town of China, of the third rank, in Chan-si.

YUNG-KANG, a city of China, of the second rank, in Quangsee. Lat. 22. 56. N. long. 107. 26. E.

YUNG-NGAN-POU, a fortress of China, in Chan-si, on the borders of Tartary.

YUNG-NING,

YUNG-NING, a town of China, of the third rank, in Se-chuen.

YUNG-NING, a city of China, of the second rank, in Chan-si. Lat. 37. 35. N. long. 110. 39. E.

YUNG-PING, a town of China, of the third rank, in Yunnan.

YUNG-TCHUN, a town of China, of the third rank, in Quangsee.

YUNGUI, a settlement of Peru, in the province of Chançay.

YUNGUYO, a settlement of Peru, in the province of Omasuyos.

YUNG-YANG, a town of China, of the third rank, in Se-chuen, on the Kincha river.

YUN-HING, a city of China, of the first rank, in Honan, watered by a river called Yubo. The country within its district is very large, and is partly flat, and partly mountainous, especially to the north and south. It is watered by several rivers, which render the soil very fruitful. Lat. 33. N. long. 113. 52. E.

YUN-HO, a town of China, of the third rank, in Tche-kiang.

YUN-LEAN-HO, a canal of China, formed of the river Pey-ho, or rather the river itself made navigable from Hiam-ho to Tientsin, in the province of Pe-che-lee, for the purpose of conveying corn towards Tongtcheou and Pekin. The name in the Chinese language is said to mean corn-bearing.

YUN-MONG, a town of China, of the third rank, in Hooquang.

YUNSHAN, the territory lying between the eastern limits of the Birman empire and China, of which very little is known, even to the Birmans.

YUNTA, a settlement of Peru, in the province of Tucuman.

YUNTAL, an island near the coast of China, in the eastern seas, 30 miles in circumference, about two miles and a half from the continent. Lat. 34. 35. N. long. 119. 19. E.

YUN-TCHUN, a town of China, of the third rank, in Fo-kien.

YUN-TOU, a town of China, of the third rank, in Kiangsee.

YUNX, in Ornithology, a genus of birds of the order picæ, and of which these are the characters:—1. Bill smoothish, cylindrical, pointed, a little curved, weak; nostrils concave, naked; tongue very long, smooth, worm-shaped, armed at the point; tail feathers ten, flexible; feet scansorial. This genus consists of only one species, and has, by most authors, been held distinct; for, though allied to some other genera, it perfectly coincides with none. The tongue and disposition of the toes correspond to those of the woodpecker; but the weakness of the bill distinguishes it from that family. It seems also to be nearly related to the cuckoo, did not its length of tongue form a marked distinction.

2. Yunx, or wryneck.—Gray, varied with brown, and blackish; belly reddish, with blackish spots; tail feathers waved with black spots, streaks, and bars. Description, however, is very inadequate to convey an accurate idea of the elegant markings of this little bird. Its name seems to have been given it from the singular manner of turning its head over its shoulder and perpetually looking about, when the black list on the back of the neck gives it a twisted appearance. The weight of this beautiful bird is about ten drams, and its length seven inches.—It inhabits Europe, Asia, and Africa, appearing in Britain about the same time with the cuckoo, and chiefly frequenting woods, or thickly inclosed countries, where trees or orchards abound. Its food principally consists of ants and other insects, of which it finds great abundance lodged in the bark and crevices of trees, and which it secures by a horny substance at the end of its long tongue. It likewise frequents ant hills, into which it darts its tongue, and draws out its prey. It is never seen with any other society than that of its female, and, as soon as the domestic union is dissolved, which is in September, they retire and migrate by themselves. It makes

Vol. XXIV. No. 1673.

an artless nest of dry grass, on dusty rotten wood, in holes of trees, and lays nine or ten eggs, which are white and transparent. If surprised in its nest, it stretches itself at full length; and erecting the feathers on the crown of its head, suddenly rises, making, at the same time, a short hissing noise, like that of a turkey cock. In the beginning of spring, it very frequently repeats a noise like that of the smaller species of hawks.

YVOIR, a small town of the Sardinian states, in Savoy, on the lake of Geneva.

YVOIX LE PRE, a small town in the central part of France, department of the Cher, with 2400 inhabitants, some iron-works, and a glass-house, near Chapelle d'Anguillon.

YUPAN, a settlement of Peru, in the province of Conchucos.

YUPANA, a small river of Cumana, which runs south, and enters the Cuyuni by the north side.

YUQUI, a river of Paraguay, which falls into the Paraguay.

YUQUIPA, a settlement of Quito, in the province of Quixos and Macas.

YURA, a settlement of Peru, in the province of Collahuas.

YURACARES, a river of Peru, in the province of Santa Cruz de la Sierra, which enters the Marmore.

YURACAYO, a settlement of Peru, in the province of Chançay.

YURANI, a river of Guiana, which runs from north to south, and enters the Cuyuni.

YURI, a small river of Guiana, which runs east, and enters the Arebato.

YURIMA, a river of Peru, in the province of Pomabamba, which runs north, and enters the large river Beni.

YURIRAPUNDARO, a settlement of Mexico, in the intendancy of Mechoachan, containing 485 Indian families.

YURMASICA, a settlement of Peru, in the province of Chachapoyas.

YURNA, a small island on the coast of Brazil, at the mouth of the river Amazons, near the equinoctial line. Long. 50. 40. W.

YURUA, a river of Peru, which falls into the Amazons, and the upper part of which is little known.

YURUA, a small island on the coast of Brazil, opposite to that of Marajo.

YURUANI, a small river of Guiana, in Surinam, which enters the Caroni.—There is another river of the same name which enters the Caura.

YURUARIO, a river of Guiana, which runs from north to south, and enters the Curguni, just before its entrance into the sea.

YURUBASI, a river of the country bounding the river Amazons, which runs east, and enters the Rio Negro.

YURUPA, or **JUPURA**, or *Japura*, a large river of New Granada, in South America, which in its origin is called the Caqueta, and, after a south-west course of nearly 1000 miles, during which it receives the accession of numerous tributaries, falls into the Amazons by many mouths, in Lat. 4. S.

YU-TAI, a town of China, of the third rank, in Shantung.

YUTAY, or **JUTAY**, a river of Peru, which is said to rise in a lake about 180 miles east-north-east of Cuzco, runs north, and enters the Amazons by the south part, in Lat. 2. 40. S.

YU-TCHIN, a town of China, of the third rank, in Kiang-nan.

YU-TCHING, a town of China, of the third rank, in Honan.

YU-TCHING, a town of China, of the third rank, in Shantung.

YUTI, a settlement of Paraguay on the shore of the Tebiquariguaza. Lat. 26. 35. S. long. 56. 16. W.

YU-TIEN, a town of China, of the third rank, in Pe-che-lee.

YU-TSE, a town of China, of the third rank, in Chan-si; 15 miles south-east of Taiyuen.

YU-TSIEN, a town of China, of the third rank, in Tche-kiang.

YUX, *s.* [yeox, Saxon: sometimes pronounced *yer*, and *yor* or *yokes*. See YEX.] The hiccup.

YUY, a river of South America, in the province of Buenos Ayres, which runs from south-east to north-west, and enters the Uruguay.

YU-YANG, a town of Corea.

Y-YANG, a town of China, of the third rank, in Honan.

Z A B

Z.

Z A C

Z IS found in the Saxon alphabets, set down by Gram-marians, but is read in no word originally Teutonic: its sound is uniformly that of an hard S. No word of English original begins with Z.

ZAAB, a district of Algiers, in Africa, lying immediately south of the province of Constantina, and consisting of a narrow tract of land, under the Atlas. It formed anciently part of the Mauritania Sitifensis, and the Roman masonry may be traced all over it.

ZAANDAM, or SAARDAM, a town of the Netherlands, in North Holland, on the Zaan, near its junction with the Y. It consists properly of two great villages, called East and West Zaandam, containing together 10,700 inhabitants. The houses are for the most part of wood. They are curiously painted on the outside; and many of them are surrounded with sections of canals; so that, with their gardens, they have each the appearance of a petty island. The town carries on an active trade, particularly in timber, train-oil, tar, and similar articles. Its manufactures of ropes, tobacco, and paper, are extensive; but the most important branch of its industry is, and has long been, ship-building. At one period, in the flourishing days of Holland, it was reckoned among the greatest magazines of mercantile naval stores in the world. It was here that the czar Peter the Great, under the name of Peter Michailov, studied the art of ship-building. The house which he occupied is still pointed out; 5 miles north-by-west of Amsterdam.

ZAANDYX, a town of the Netherlands, in North Holland, with 1500 inhabitants.

ZAB, a village of Irak Arabi, on the Euphrates; 65 miles west-south-west of Bagdad.

ZAB, a river of Kurdistan, formed by the confluence of a multitude of small brooks, in the mountainous country to the east of the Tigris. About 150 miles north of Bagdad, on the road to Mosul, it falls into the Altun su, or golden water; and the united streams afterwards reach the Tigris.

ZAB, GREAT, a considerable river of Kurdistan, which rises in the mountains of Solymania. It flows, first west, then north, and after receiving several tributaries, falls into the Tigris, about 40 miles below Mosul. It is so deep, as only to be fordable during the summer months.

ZABALETAS, a settlement of New Granada, in the province of Antioquia.

ZABBAR, a town of the island of Malta, finely situated between Cottonera and Zejtone. Around it are raised very fine wheat, Indian corn, two sorts of cotton, one white, the other of a dark nankeen colour, and a quantity of the small purple figs, on which, with coarse brown bread, the natives chiefly live. Population 2400.

ZABELTITZ, a village of Germany, in Saxony; 12 miles north of Meissen, with a beautiful palace, belonging to the royal family.

ZABER, a river of the west of Germany, in Wirtemberg, which joins the Neckar near Laufen.

ZABIN, a small town of Russian Lithuania, in the government of Minsk; 30 miles north-east of Minsk.

ZABLUTOW, a town of Russian Lithuania, in the province of Bialystok; 11 miles south-east of Bialystok. Population 1400.

ZABNO, a market town of Austrian Poland, on the river Donajec; 10 miles north-north-west of Tarnow.

ZABOLA, or SABOLA, a petty town of Transylvania, in

the country of the Szecklers. It has salt mines in the neighbourhood, and is ten miles north of Cronstadt.

ZABOROWO, a town of Prussian Poland, on the borders of Silesia; 22 miles east-north-east of Gros Glogau. Population 1000.

ZABULISTAN, the ancient name of a province of Hindostan, now included in Afghanistan, and which comprised the districts of Cabul, Ghizne, and part of Lumghau. The city of Ghizne was its capital.

ZACA, a village of Egypt, near the frontier of Syria; 17 miles north-east of El Arish.

ZACACHE, a settlement of Mexico, in the intendency of Oaxaca, containing 400 Indian families.

ZACAN, a settlement of Mexico, in the intendency of Mexico, containing 333 Indian families.

ZACAPUASTLA, a settlement of Mexico, in the intendency of Mexico, containing 500 Indian families, and 40 of Spaniards and mulattoes.

ZACATECAS, one of the provinces into which Mexico is now divided. This province is a mountainous and arid tract, with a rigorous climate, and is singularly ill peopled. It is bounded on the north by Durango, on the east by San Luis Potosi, on the south by the province of Guanajuato, and on the west by that of Guadalaxara. Its greatest length is 85 leagues, and its greatest breadth, from Sombrete to the Real de Ramos, 51 leagues. Zacatecas is nearly of the same extent as Switzerland, which it resembles in many respects. The relative population is hardly equal to that of Sweden. The table land, which forms the centre, of the province of Zacatecas, rises to more than 6500 feet above the level of the sea. This province is famous for its mines, which are very rich. The mine of the *Veta Negra de Sombrete* exhibited an example of the greatest wealth of any seam yet discovered in the two hemispheres. According to the latest enumeration, the inhabitants of the province amounted to 153,000. The extent of its surface is 2353 square leagues; and there are consequently 65 inhabitants to each square league.

ZACATECAS, the capital of the above province, situated about 120 miles north of Guadalaxara, and 240 north-west of Mexico. It is, after Guanajuato, the most celebrated mining place in New Spain, and contains at least 33,000 inhabitants. It consists chiefly of one street, in a deep passage, between high rocks, crowned with cottages.

ZACATEPEC, a settlement of Mexico, containing 156 Indian families, and 46 Spanish.

ZACATULA, or SACATULA, a small seaport, situated on the eastern coast of Mexico, on a river of the same name. It lies on the frontiers of Valladolid; 150 miles south-west of Valladolid.

ZACATULA, a river of Mexico, which has its rise in the cordillera of Anahuac, and discharges itself into the Pacific.

ZACATZAN, a town of Mexico, containing 300 Spanish, and 700 Indian families; 35 leagues east-north-east of Mexico.

ZACCHIA (Paolo), an eminent physician, was born at Rome in 1585, and in the progress of life was distinguished by his learning, and by his skill in music, painting, poetry, and eloquence, as well as in the more appropriate sciences relating to his own profession. He was physician to pope Innocent X., and celebrated among his contemporaries by various

various publications; of which the principal is intitled "Questiones Medico-legales, in quibus omnes materiæ medicæ quæ ad legales facultates videntur pertinere, proponuntur, pertractantur, resolvuntur;" a work which has been often reprinted. He was also the author, in Italian, of two esteemed works, "Del Vitto Quadragesimale," 1637, the subject of which is the regimen of Diet in Lent; and "De' Mali Ipocondriachi," 1639, a diffuse treatise on hypochondriacal affections. He died in 1659, aged 75.—*Haller. Eloy. Gen. Biog.*

ZACCÒNI (P. Lodovico), of Pesaro, author of an ample treatise on music, entitled "Prattica di Musica," the first part of which was printed at Venice, 1592, and the second in 1596; a publication in which the author not only proposes to give instructions for the regular composition, but the accurate performance of every species of music. The idea is splendid; but the world has been so frequently deceived by the titles of books, that authors are obliged to abate in their promises, in proportion as the expectations of the public are diminished. If arts and sciences could be acquired by the dead letter of silent instruction, every one who could read, in Italy, might, during the times under consideration, have been a musician. But though no ingenious occupation was perhaps ever yet completely taught by books, without a master, or by a master, without books, yet they are excellent helps to each other. It is hardly possible for a didactic work to satisfy all the doubts that arise in an inquiring mind during solitary meditation; particularly in the first stages of a student's journey through the rugged roads of science. But when he has made some progress, if he should be separated from his guide, the way becomes daily so much more straight and smooth, that by the help of these kinds of charts, he will be enabled to advance with tolerable speed and facility by himself.

Zacconi's work, though sometimes dry and tedious, contains much useful and practical knowledge. And as he is almost the only Italian writer on the subject of music who has not bewildered himself in inquiries concerning the systems of the ancient Greeks, or the philosophy of sound, he has had the more leisure for analysing the art, and facilitating the student's progress. This author regarded Okenheim, Josquin, Isaac, Brumel, Mouton, and Senfelio, as ancients compared with Willaert, Morales, Cipriano, Zarlino, and Palestrina; and these last, ancient with respect to himself and contemporaries; that as the ancient Greeks and Romans produced their musical effects by mere melody, united with poetry, and Josquin and other early contrapuntists, by notes of different lengths, harmonized and worked into perpetual fugue; so the more modern, though the rules of harmony are the same, by a different disposition of concords, inversions, and other contrivances, produce a greater variety of effects.

ZACHARIE (Justus Frederick William), was born at Frankenhäusen in Thuringia in 1726; and during the course of his elementary education at his native place, he distinguished himself by various poetical pieces. In 1743 he went to Leipsic to study jurisprudence, but directing his chief attention to the belles lettres, he produced his mock-heroic poem, entitled "Renommisten," which Eichhorn, in his History of Literature, says, was the commencement of heroic-comic poetry among the Germans. In the following year, he was admitted as an associate by the young men who contributed to the work published under the title of "Amusements of Reason and Wit." From Leipsic, where he remained about three years, he removed to Gottingen, where, attracting the notice of professor Klaproth, he was recommended by him to be a member of the German society. In 1748 he was appointed tutor at the Caroline college at Brunswick, and in 1761 he became professor of poetry in that institution; to which, in the succeeding year, were annexed the offices of inspector of the typographic and bookselling establishment belonging to the Orphan house, and director of the Brunswick Intelligencer. From 1768 to 1774 he was editor of the New Brunswick Gazette; in 1775 he was appointed to the diaco-

nate of St. Syriac, at Brunswick; and he died in the month of June, 1777, in the 51st year of his age. His biographer states, that "he possessed a very fertile and vivid imagination, with a fine taste, improved by observation and acquaintance with the world. As a poet, he composed with uncommon facility, and tried his talents in almost every species, but was the most successful in the descriptive and heroi-comic. His burlesque poems were distinguished from every thing of the kind that had before appeared in Germany." A collection of Zachariæ's poetical works was published at Brunswick in 1763—1765, 9 vols. 8vo. *Gen. Biog.*

ZACHARIAS (*Pope*), a native of Greece, succeeded Gregory III. in 741; at a time when the Roman territory was threatened with an invasion by Luitprand, king of the Lombards, and when the sons of Charles Martel were too much engaged by domestic broils to undertake its defence. The pope, therefore, tried how far he might avail himself of the authority of religion in averting the storm; and by a solemn embassy and personal visit, he not only obtained peace, but induced Luitprand to restore to the Roman see four cities which he had taken from it. He also interposed, in 743, with Luitprand on behalf of the exarch of Ravenna, and prevailed with him to desist from an invasion of the exarchate, and to grant peace, as well as to give back the fortress of Cesena to the exarch; and in the same year he held a council at Rome to settle some matters of discipline, particularly such as related to the clergy. During the pontificate of Zacharias in the year 746, Carloman, the eldest son of Charles Martel, who had surrendered his dominions to his brother Pepin, went to Rome, and assumed the monastic habit, with which he was solemnly invested by the pope. Zacharias, having displayed talents in the exercise of his office, which gave him rank among the greatest of the popes, and having established an estimable character by his liberality to the poor, and by his munificence in public works, died in 752, in the 11th year of his pontificate. Some of his decrees and epistles, and also his translation of the dialogues of St. Gregory from Latin into Greek, are extant. *Bower.*

ZACHARIE, a town of France, department of the Var, with 1500 inhabitants; 9 miles south-west of St. Maximien.

ZACHEO, or DESECHIO, a small island, eight or nine leagues to the north-east-by-north of Mona, between the island of St. Domingo and that of Puerto Rico. It is nothing more than a green mountain, 800 or 1000 yards long.

ZACHTLÉVEN (Cornelius), was born at Rotterdam in 1606, and became an admirable painter of scenes of humour, imitating the style of Brouwer; but in subjects of a more sober description, which he also painted, such as farm-houses, kitchens, and the recreations of villagers, &c. he chose the more light and agreeable style of Teniers for his model; and in that style attempted to embody the same description of persons and compositions. In neither, however, of his imitations did he attain an equal degree of spirit or of truth with his prototypes. His works are well composed, and the touch with which they are executed is bold and free; they are not often met with, but are thought deserving of a place in the best collections.

ZACHTLEVEN (Herman), was the younger brother of Cornelius, and was born at Rotterdam in 1609. He is said to have been the pupil of Van Goyen, but did not follow the style of that master. His principal occupation appears to have been in painting views of the banks of the Rhine and the Meuse: These he executed in a very neat manner, but with a mean and common-place style of selection and imitation. The tones and hues of his pictures are generally cold, but fresh; and as he appears to have had great knowledge of aerial perspective, his distances are well preserved; and the forms drawn with great care and minuteness. He never left Flanders, though it has been asserted that he went to Italy. His drawings are numerous, and are carefully preserved in the best collections. He died in 1685, aged 76. Both he and his brother Cornelius employed the etching-needle, and left several neatly executed plates, from designs of their own.

ZACKEN, a river of Prussian Silesia, which rises among
the

the Riesengebirge mountains, and joins the Bober below Hirschberg. Near its source is a mountain called the Zackenfall, about 2200 feet in perpendicular height.

ZACONIA, or ZAKONIA, a mountainous and arid district of Greece, occupying the south-east part of the Morea, and including portions of the ancient *Laconia* and *Arcadia*. See MAINA.

ZACUTO, or ZACUTUS LUSITANUS, a physician, was born at Lisbon in 1575, and educated at Salamanca and Coimbra. In his 20th year he took the degree of doctor, and settling in his native city, practised with reputation for thirty years. As he was a descendant of Jewish parents, his dread of the Inquisition, after the edict of Philip IV. against the Jews was issued in 1625, induced him to retire to Holland, where he openly professed the religion of his family, and maintained a character highly respectable, both in his profession as a physician, and in his moral conduct. He died at Amsterdam in the year 1642; and left behind him a collection of works, amounting to 2 vols. fol. The principal of his works are, "De Medicorum Principum Historia," lib. 6. in which he approves himself a strenuous advocate of Galen and the Greek physicians; "Praxis Historiarum Morborum," lib. v.; and "Praxis Medica admiranda," lib. iii. In all his works he blends acuteness of observation with a certain degree of superstitious credulity; but they are nevertheless consulted and quoted. *Haller*.

ZADAN, a town on the west coast of the island of Celebes. Lat. 2. 55. S. long. 119. 9. E.

ZADAON, or CADAON, a river of the south of Portugal, which rises in the mountains of Algarva, and falls into the ocean at St. Ubes.

ZADORA, a river of Spain, in the province of Alava, which flows past Vittoria. Its banks were the scene of the celebrated battle of 21st June, 1813.

ZAFANIN, a village of Fez, near the coast of the Mediterranean; 35 miles south east of Melilla.

ZAFFAR, or ZAFFIR, *s.* Powder the calx of cobalt fine, and mix it with three times its weight of powdered flints, this being wetted with common water, concretes into a mass called *zaffre*, which from its hardness has been mistaken for a native mineral. *Hill*.—Cobalt being sublimed, the flowers are of a blue colour; these, German mineralists call *zaffir*. *Woodward*—The artificers in glass tinge their glass blue with that dark mineral *zaphra*. *Boyle*.

ZAFRA, a town of Spain, in Estremadura, situated on an eminence. It has only one church, but contains seven monasteries, and 6000 inhabitants, who are employed partly in tanning and making gloves, partly in rope-making and the manufacture of earthenware; 20 miles east of Xeres de los Cavaleros.

ZAFRA, a small town of Asiatic Turkey, in the government of Marasch; 15 miles west of Tarsus.—There is another of the same name in the government of Trebisond; 50 miles north-west of Trebisond.

ZAGAROLA, a small town of Italy, in the Ecclesiastical States, Campagna di Roma, with the title of a duchy.

ZAGGOS, a mountain of Algiers, in Africa, in which are some salt mines.

ZAGHAVA, a kingdom of Central Africa, described by the Arabian writers as situated on the eastern part of the course of the Niger; but its position is very difficult to determine, and no country of that name is mentioned by modern travellers. It probably occupied a part of the modern Bornou.

ZAGORA, a town in the east of European Turkey, in an inland situation, but adjoining a lake which communicates with the Black sea. It is called by the Greeks Debeltus or Dueltus, is situated in the province of Romania, and has nothing in particular to distinguish it from the general backwardness of a country thinly peopled, ill cultivated, and rarely visited by European travellers; 12 miles south-west of Burgas.

ZAGORA, a large village, or rather town, of European Turkey, in Greece, province of Magnesia, situated on the

declivity of Mount Pelion, about a league from the sea. Its houses are in general surrounded with chesnut trees, but the adjacent territory is by no means fertile, and the place is remarkable for little except a Greek school, provided with a library and annual income.

ZAGOREA, a district in the west of Turkey in Europe, in Albania, near the source of the river Vohutza. It is inhabited, not by Turks, but by Greeks, who are considered descendants of the ancient Pelagonians, the site of whose capital, the present town of Zagorium, the chief place of the territory, is supposed to occupy. The country is extremely mountainous and woody. The inhabitants, a hardy and spirited race, are subject to the pacha of Joannina.

ZAGOROWO, a town of Poland, in the palatinate of Kalisch; 30 miles north-by-west of Kalisch. Population 800.

ZAGRAB, or AGRAM, a county in what is termed the civil part of Austrian Croatia, comprising the west part of the province, adjacent to Illyria. Its area is 2080 square miles; its population nearly 180,000. It contains mountains covered with vast forests, is watered by the Save, and produces corn, tobacco, and vines; also potash, timber for export, and iron. The chief town is Agram or Zagrab, the capital, not of this county only, but of Croatia. Part of this county was ceded to Bonaparte in 1809, and was incorporated in the new kingdom of Illyria in 1816. See CROATIA.

ZAGRAB, or AGRAM, a city of the Austrian states, the capital of Croatia, and the chief town of the county of Agram. It consists of three parts, the Royal Free town, the Bishop's town, and the suburb of Harmitz. The first stands on a very steep eminence, is surrounded with a wall, and is the residence of the ban (the chief civil magistrate) of Croatia; also of the military governor; and is the meeting-place of the diets of the county. It contains likewise a number of neat private houses. The bishop's town stands in a deep valley, on the other side of a stream called the Blutbach. It contains the cathedral, the episcopal residence, the chapter-house, and two inferior churches. Adjoining to it is the suburb; and both these parts belong to the bishop, who exercises a certain jurisdiction over the inhabitants. Agram has a population of about 17,000, and, for an inland town, is well situated for trade. The trade of the place consists chiefly in the produce of the vicinity; in corn, wine, and tobacco; also in salt. It has some intercourse with Fiume and Trieste, which may be termed the maritime outlets of Croatia; 84 miles east-by-north of Fiume, and 144 south of Vienna. Lat. 45. 49. 2. N. long. 16. 4. 41. E.

ZAGYVA, a large river in the interior of Hungary, which rises on Mount Mafra, in the county of Heves, flows southward, and falls into the Theyss at Szolnok.

ZAHARA, a small town of Spain, in the province of Seville, near the source of the river Guadalete. It stands on a hill. The houses are scooped out of the solid rock; and the precipice behind them is at least 1200 feet in height. It is accessible only by a narrow pathway, which a mule cannot ascend without difficulty. There are several small towns in the south of Spain, situated on similar spots, having been erected by the Moors, after the continued attacks of the Spaniards rendered a residence unsafe in the plains; 40 miles south-east of Seville.

ZAHNA, a town of Prussian Saxony; 9 miles north-east of Wittenberg. Population 1400.

ZAHRINGEN, a petty town of the west of Germany, in Baden, once the residence of a celebrated family of that name; 2 miles north of Freyburg.

ZAILA, a settlement of Peru, in the province of Parinacochas.

ZAINAH, a place of Algiers, in the province of Constantina, in which are considerable ruins, probably those of the ancient Zama; 40 miles south-west of Constantina.

ZAINE, or WED EL BERBER, a river in the western part of the territory of Tunis, in Africa, which falls into the Mediterranean, Lat. 36. 54. N. long. 9. 16. E.

ZAIZAN, NOR, a large lake of Tartary, situated among the Altai mountains, near the Frontier of Asiatic Russia. It

is formed by the Irtysh, which passes through it, and bears above, the name of Upper, and below, that of Lower.

ZALANGO, a small island of the Pacific ocean, near the coast of Guayaquil.

ZALATHNA, a town of Transylvania, in the county of Lower Weissenburg, on the small river Ampoy. It has 4000 inhabitants, partly of Wallachian, and partly of German and Magyar descent. The principal employment of the inhabitants is mining; and it is here that the gold washed by the Gypsies and Wallachians, from the sand of the rivers, is purchased by the officers of government. The mines of Zalathna produce gold, silver, cinnabar, and mercury. Tellurium is also found at one place in the neighbourhood. At a little distance are the ruins of a town, supposed to be the *Colonia Perendanesiorum* of the Romans; 20 miles west of Carlsburg.

ZALESIE, a village of Poland, near the frontiers of Russia; 46 miles east-by-south of Siedlec.

ZALESZCZYKI, a town of Austrian Poland, on the Dniester, and the frontiers of Moldavia. It contains 5500 inhabitants, and has manufactures of woollens; also of glass. It was founded by the celebrated count Stanislaus Poniatowsky, who invited to it a colony of German manufacturers, chiefly Lutherans; 120 miles south-south-east of Lemberg. Lat. 48. 43. N. long. 25. 46. 5. E.

ZALEUCUS, a philosopher and legislator of Greece, and founder of the Locrian state, flourished in the 7th century B. C. He was of obscure birth, and lived in servitude as a shepherd; but his extraordinary abilities and merit attracted notice even in his humble station, and advanced him to the government. His laws were deemed severe, but being adapted to the circumstances and manners of the Locrians, their constitution was for several ages highly celebrated. His discipline was rigorous, so that he prohibited the use of wine, otherwise than as a medicine; and he ordained, that adulterers should be punished with the loss of their eyes. When his son had incurred this penalty, he blended paternal lenity with a pretence of maintaining the authority of the laws, by ordering his son to be deprived of one eye, and by submitting to the loss of one of his own eyes. In order to secure the permanent stability of his system of legislation, he required that a person who proposed a change in any one of them should come before the assembly with a cord about his neck, that he might be instantly strangled, if upon examination the old law were preferred. *Diod. Sic. Laert. Brucker, by Enfield.*

ZALOSCE, a small town of Austrian Poland, in the circle of Zloczow. It is divided by the river Sereth, into Old and New Zalosce. The inhabitants are chiefly of the United Greek church.

ZAMBA, a settlement of New Granada, in the province of Carthagena.

ZAMBA, a bay on the coast of New Granada, and province of Carthagena. It is very large, convenient, and sheltered from the winds; for which reason it is much frequented by vessels, which generally enter it to take in water.

ZAMBA, an island, called Galera de Zamba, from its long and narrow figure, and forming one of the sides of the former bay.

ZAMBA, a seaport of south America, in the gulf of Darien, noted for the fertility of the adjacent country.

ZAMBE, a point on the coast of Carthagena, in New Granada, between the city of Carthagena and the river Magdalena.

ZAMBESE, or **CUAMA**, a large river of Eastern Africa, which rises from unknown sources, in a mountainous territory in the interior, rolls through the kingdom of Mocaranga, and falls into the Indian ocean, in lat. 19. S. long. 37. E. Gold mines are found near its banks; and a considerable quantity of ivory is also brought down. With a view to the carrying on of this trade, the Portuguese have erected forts at Sena and Tete.

ZAMBORONDON, a settlement of Quito, in the province of Guayaquil. Lat. 0. 48. S.

ZAMBRANO (Juan Luis), a Spanish painter; was born

at Cordova in 1599. He was a disciple of Paolo de Cespedes, and was a successful follower of the style of that master. His principal works are in the cathedral at Cordova, and in the church of the convent of Los Martyros, where he painted two altar-pieces, representing the stoning of St. Stephen, and the martyrdom of St. Acisclo and St. Victoria. In the colegio di Santa Catalina is a fine picture by him of a guardian angel and a St. Christopher, which Palomino describes as designed in the great style of M. Angelo. He passed the latter part of his life at Seville, where he painted several altar-pieces for the church of St. Basil, and died in that city in 1639, at the age of 40.

ZAMBRANO, a settlement of New Granada, in the province of Carthagena, situate on the shore of the Magdalena.

ZAMBRONA, a cape of Naples, on the west coast of Calabria. Lat. 37. 48. N. long. 16. 6. E.

ZAMIA, in Botany, a genus of the class appendix palmæ, dioecia order polyandria, natural order of palmæ, filices (*Juss.*)—Generic Character. Male—Calyx: ament strobile-shaped, ovate, obtuse; scales horizontal, peltate, obovate, very blunt, one-flowered, thickened at the top, permanent. Corolla none. Stamina: filaments none. Anthers subglobose, clustered, accumulated in the lower surface of the scales, sessile, two-valved, opening above by a longitudinal cleft. Pollen, farinaceous. Female—Calyx: ament strobile-shaped, larger, ovate, imbricate; scales pedicelled, peltate, angular, finally distant, permanent. Corolla none. Pistil: germs two, irregular, angular, inserted into the margin under the pelta of the scales, solitary on each side, nodding. Style noue. Stigma obtuse, obscurely cleft on the side. Pericarp: berries to each scale two ovate, barked at the base, fleshy, one-celled. Seed one in each berry, ovate.—*Essential Character.* Male—Ament strobile-shaped, scales covered with pollen underneath. Female—Ament strobile-shaped, with scales at each margin; berry solitary.

1. *Zamia furfuracea*, or broad-leaved zamia.—Leaflets wedge-shaped, straight, very smooth from the middle to the tip, serrate, scurfy underneath; stipe spiny. Stem thick, seldom rising more than two feet high.—It was discovered by Dr. Houston in the sands near Old Vera Cruz, in America.

2. *Zamia integrifolia*, or dwarf zamia.—Leaflets mostly quite entire, bluntish, awnless, straight, shining; stipe unarmed. The spadix is divided into florets after the manner of the fruit of the cypress.—Native of East Florida.

3. *Zamia debilis*, or long-leaved zamia.—Leaflets linear, awnless, serrulate at the tip from spreading, recurved, longer than the channelled rachis; stipe three-sided, compressed, unarmed.—Native of the West Indies.

4. *Zamia pungens*, or needle zamia.—Leaflets awl-shaped, spreading, strict, rigid, mucronate; the outer margin of the base rounded; stipe roundish, unarmed.—Native of the Cape of Good Hope.

5. *Zamia cycadis*, or narrow-leaved zamia.—Leaflets oblique, linear-lanceolate, awl-shaped, hairy, curved, one, two, or three-spined at the tip; stipe unarmed.—Native of the Cape of Good Hope.

ZAMIANSK, a small Cossack town on the banks of the Volga, in the Russian government of Astracan, where a considerable fishery is carried on; 20 miles north-west of Astracan.

ZAMOLXIS, a celebrated person among the Scythians, was, as some have supposed, a slave of Pythagoras, who, having attended him into Egypt, obtained his freedom, and taught his master's doctrine among the Getæ. It has been also said, that in order to enforce the belief of the immortality of the soul, he dug a subterraneous apartment, and concealed himself in it for three years; but re-appearing as one risen from the dead, he there established his authority as a teacher. But Herodotus, who relates this fabulous story, as a common tradition, gives it no credit, but expressly says, that so far from being a Pythagorean, he flourished at a much earlier period than Pythagoras. The general testimony of the ancients furnishes reason for concluding; that Zamolxis was a Thracian, who, at a very remote period, taught the Scythians the doctrine of the immortality of the soul, and that

after his death, they enrolled his name among the divinities with whom they assured themselves they should associate in the invisible world. Herodotus relates, that at certain festivals, they chose several persons by lot, who were to be deputed as messengers to Zamolxis; and that they put them to death, by throwing them up into the air, and catching them, as they fell, upon the points of their spears; and this story is thought to be the more credible, because it is well known, that the practice of offering human sacrifices prevailed among the Scythians and the Thracians. *Herodotus. Brucker, by Enfield.*

ZAMORA, a province in the north-west of Spain, formed of a part of the great province of Leon, and lying to the south and north of the Douro, on the frontiers of Portugal. Its area, equal to one of our larger counties, is 1650 square miles; its population, far more thinly scattered, is only between 70,000 and 80,000. Its surface is in general hilly, and ill adapted to tillage. In fruit, however, it abounds; and the climate, (the latitude being 42. N.) is in general well adapted to vines. Its manufactures are quite insignificant; its exports are limited to wool, wine, and hides, along with small quantities of linen and corn.

ZAMORA, a considerable town in the north-west of Spain, in Leon, the capital of the preceding province. It is built near the north bank of the Douro, and to the east of an angular district, formed by a projection of the Portuguese territory into that of Spain. The height it stands on commands the river, and gives it, from a distance, a good appearance; but the houses are old fashioned, the streets narrow, and the appearance of the interior in general gloomy. It is the residence of a bishop, contains a number of churches and chapels, and has about 9000 inhabitants. It is also the seat of the government offices of the province, has a few manufactures of serge and linen, and a school for engineers. It is a place of old date, having derived its present name from the Moors, who called it *Medinato Zamorate*, or the town of turquoises, stones of that description being frequently found among the neighbouring rocks. In the 11th century it was demolished by a Moorish force, but rebuilt by the Spanish government, and fortified as a frontier town on the side of Portugal. The walls are still kept up; but the population of the place is said to have considerably declined. The environs are fertile, and well adapted to pasturage; 33 miles north of Salamanca. Lat. 41. 35. N. long. 5. 22. W.

ZAMORA, a town of Mexico, and capital of a jurisdiction of the same name, in the province of Valladolid. The town is well built. It extends a quarter of a league from north to south, and somewhat less from east to west. It has many gardens and orchards, which are irrigated by a fine river, called the Rio Grande, which has also several other smaller rivers, which may be called its branches. This river runs south, and abounds in fine fish; and the greater part of the town stands upon its banks; and on these are also many fields of wheat. The town was founded in 1540 by order of the king, for a garrison, and as a frontier to the Chichimeca nation. Its population is composed of 300 families of Spaniards, mustees, and mulattoes. It has, besides the parish church, two convents; 155 miles west-north-west of Mexico. Lat. 20. 2. N. long. 101. 46. W.

ZAMORA, a town of Quito, in the province of Jaen de Bracamoros, situated on the shore of the river Zamora. Since its mines have been abandoned, it has fallen to be nothing more than a miserable village. It is still inhabited by some reduced but industrious families; 234 miles south of Quito, and 85 north-north-west of Jaen. Lat. 4. 2. S. long. 78. 50. W.

ZAMORA, a large river of Quito, which rises in the province of Jaen de Bracamoros, and after collecting the waters of many streams, falls into the Mayo or Santiago, which enters the Amazons.

ZAMOSKI, a town in the south-east of Poland; 47 miles south-south-east of Lublin, and belonging to what is now called the kingdom of Poland. It is situated on a small eminence, surrounded by marshes, and having large forests to the south-east and north-west. It is not an ancient place, having

been built in the close of the 16th century, and fortified according to the rules of that age. It has long been considered a military station of importance. In 1656 it was unsuccessfully besieged by the Swedes; in 1715 it was surprised by the Saxons; and in the civil contests of 1771, the Poles were defeated in its vicinity, by the Russians. In 1812 it was one of the few towns in which the French left a garrison, after their retreat from Russia. Its fortifications have not been carefully kept up; but it has a stately cathedral, several churches, a lyceum, and classical school, in lieu of its former university; also a public library, and a population, chiefly in the suburbs, of 6600. Lat. 50. 43. N. long. 23. 15. E.

ZAMOSZZYN, a small town of Prussian Poland, near the Netz, and 44 miles north-by-east of Posen.

ZAMPALA, a river of Mexico, which rises in the province of Tlascalala, and runs into the gulf of Mexico. Lat. 19. 40. N.

ZAMPALA, or CHEMPOALLA, or ZEMPOALA, a city of Mexico. When Cortez landed in the year 1519, the chief or lord of this place, who was tributary to Montezuma, offered his service to the Spaniards. It was at that time a large city, and exceedingly populous, the lowest account reckoning the inhabitants at 20,000 or 30,000. It was at that time the capital of a country called Totonacapan, now the north-east part of the province of Tlascalala; 90 miles east of Puebla de los Angeles. Lat. 20. 10. N. long. 97. 50. W.

ZAMPIERI (Domenico), called *Domenichino* in the History of Painting, was born at Bologna in 1581, and placed when very young under the tuition of Denis Calvert; but being ill treated by him, he prevailed upon his father to permit him to enter the school of the Carracci, at the time when Guido and Albano were both students there. He soon distinguished himself, but more by his care and assiduity than by brilliancy of talent. He here attached himself to Albano, and, when he left the Carracci, they travelled together to Parma, Modena, and Reggio, to study the works of Correggio and Parmeggiano, and soon afterwards they both went to Rome. In that city his first patron was cardinal Agucchi, who employed him in his palace, and commissioned him to paint three pictures for the church of S. Onofria, of subjects from the life of S. Jerome. His former master, An. Carracci, also employed him for some time to assist in his great work at the Farnese gallery; and he painted from his own designs, in the loggia in the garden, the Death of Adonis, when Venus springs from her car to assist her unfortunate lover.

Domenichino not only excelled in historical painting, in works both great and small, but he has also left us many landscapes of extraordinary excellence in point of tone; seldom can so much be said of their compositions. They are generally select in scenery, of a grave and dignified character, and are executed with boldness and freedom, and enriched with figures. A very fine one may be seen in the collection of the marquis of Stafford. He is universally esteemed as the best among the disciples of the Carracci, and Nicolo Poussin is said to have preferred him before them: but that favour, if we except the Communion of S. Jerome, his works will scarcely be found to support. M. Fuseli has remarked, that "expression which had languished after the death of Raphael seemed to revive in Domenichino; but his sensibility was not supported by equal comprehension, elevation of mind, or dignity of motive." His forms are by no means so pure or graceful, or his actions so natural and unconstrained, as those of that divine painter. His invention does not appear to have been vivid, but his study was unremitting, and with all his defects he well deserved the title of a great painter, and certainly has not since been equalled. He died in 1641, aged 60.

ZAMUCOS, a settlement of Peru, in the province of Chaco, situate on the shore of the river Paraguay.

ZAMUDIOS, a river of New Granada, in the province of Chaco, which runs west, and enters the Pacific ocean.

ZANCA, a settlement of Peru, in the province of Quispicanchi.

ZANCHI (Basilio), an elegant Latin poet, was born at Bergamo in 1501, and pursued his studies under Giovita Rapicio

Rapicio with so much ardour, that at the age of seventeen he made a collection of Latin poetical epithets, which was afterwards published. Before he had attained the age of twenty he visited Rome, and was much noticed by the poets of that city. According to the practice which then prevailed, he changed his baptismal name Pietro into L. Petreius; but afterwards, returning to Bergamo, and entering, in 1524, among the canons-regular of Lateran, he assumed that of Basil; devoting his attention to sacred literature, and publishing some works on the scriptures. In the progress of his life, he frequently changed his residence, and was every where respected, on account of his learning and talents, by the principal scholars of the age. Under the severe decree of pope Paul IV. issued in 1558, which commanded, under the threatened penalty of the prison or galleys, all the religions to return to the cloisters to which they belonged, Zanchi was imprisoned, and fell a sacrifice to the rigour of confinement. One of his biographers says, that he had few equals in the sweetness, and fewer in the elegance of his poetry; specimens of which occur in his eight books of poems, one of which bears the title of "De Horto Sophiae," and describes the most remarkable facts and doctrines of the Catholic religion. Some of his poems are inserted in the "Deliciae," and the "Carmina Poetarum Italorum." He also published a kind of Lexicon, entitled "Latinorum Verborum ex variis auctoribus Epitome." *Moreri. Gen. Biog.*

ZANCHI (Girolamo), an Italian Protestant, was born in 1516 at Alzano, in the territory of Bergamo, and entered among the canons-regular of Lateran at the age of fifteen, in which connection he remained for ten years. But Peter Martyr having communicated to him, and others of his fraternity, the opinions of the reformers, he departed with him from Italy in 1530, and went to Geneva. From Geneva he removed to Strasburg upon an invitation to supply a vacancy in the professorship of sacred literature, which he accepted in 1553, and which he occupied for about eleven years. In 1568 he removed to the theological chair at Heidelberg, when he took the degree of doctor. When Frederic III., who was a zealous Lutheran, succeeded the elector palatine, and removed the Heidelberg professors, Zanchi, declining offered settlements at Leyden and Antwerp, took a place in count John Casimir's college at Newstadt. Upon the restoration of the expelled professors, Zanchi, on account of his age, was declared "emeritus;" and having lost his sight, died at Heidelberg in 1590.

Highly esteemed among Protestants in general on account of his learning and invincible attachment to their principles, John Sturmius affirmed of him, "that he should not be at all anxious for the cause of reformed religion, if Zanchius alone were to dispute in the council of Trent against all the fathers present." *Bayle.*

ZANCOS, a settlement of Vilcas Huaman, in Peru.

ZANCUDOS, a missionary settlement of New Granada, in the province of San Juan de los Llanos, on the shore of the river Apure.

ZAND, a village in the north-east of the Netherlands, with 900 inhabitants; 10 miles east-south-east of Groningen.

ZANDVORT, a village of the Netherlands, in North Holland; 5 miles west of Haarlem. Population 800.

ZANESVILLE, a post town of the United States, and capital of Muskingum county, Ohio, on the east bank of the Muskingum, opposite Putnam. It is a pleasant and flourishing town, and contains a court-house, two banks, two printing offices, a woollen manufactory, two glass manufactories, and had, in 1816, 317 houses, many of which are handsome. There is a copperas mine near the town; and a copperas manufactory has lately been established here. Here are two bridges erected across the Muskingum. Zanesville is situated at the falls of the river, on which are erected numerous mills and manufacturing establishments; and it will probably become a large manufacturing town; 60 miles east of Columbus, 60 north of Marietta, and 70 north-east of Chillicothe. Lat. 39. 58. N. long. 82. 3. W.

ZANFARA, a kingdom of Central Africa, situated to the north of Wangara. It is now united to Guber, and pays tribute to Asben. It was reported to Brown as containing silver.

ZANGUAL, a settlement of Peru, in the province of Truxillo.

ZANGUEBAR. This term, which signifies literally the country of the Blacks, has been vaguely applied to a large extent of the eastern coast of Africa, between Mozambique and the Red Sea. The inhabitants consist of negroes, with a number of Arabs settled in the towns. The cities of Quiloa, Mombaza, Melinda, and some others, have been visited by Europeans; but the interior is entirely unknown. During the prosperity of the Portuguese, their empire extended over the greater part of this coast; but they have now been generally obliged to give place to the Imam of Mascat.

ZANHAGA, or ZENHAGA, a name given to the western part of the Sahara, bordering on the Atlantic.

ZANJON, a river of Chili, which runs nearly north, and enters the Valdivia.

ZANJON, PRIMERO, a river of Quito, in the province of Mainas, which runs north-north-east, and enters the Machapo.

ZANKARADA, a village of European Turkey, in Greece, province of Magnesia, about 9 miles north-east of the small town of Propantos. It contains above 400 houses, which occupy a large space of ground, being separated, as at Zagora, from each other by gardens and rows of chesnut trees. The women are employed chiefly in the spinning of cotton; while the young men repair to the surrounding districts, in search of employment.

ZANNICHELLI (John Jerome), a physician and naturalist, was born at Modena, in 1662, and settling in the medical department at Venice, he published a work on the preparation of chemical medicines, entitled "Promptuarium Remediorum Chymicorum." In 1702, he was created, by a patent of the duke of Parma, doctor of medicine, surgery, and chemistry. He afterwards formed a museum of natural history, and made many journies in order to collect fossils and other subjects for this repository. Some of his excursions were undertaken by public authority, as he was nominated by the chamber of health, physician-naturalist to all the states of Venice. He died in 1729. During his life-time he published several tracts relating to botany and lithology; and after his death his son John James edited from his MSS. "Opuscula Botanica Posthuma," 1730, and "Istoria della Pianta che nascono nel lido intorno a Venezia," 1735, being a description, with figures, of the plants on the Venetian shores.

ZANNICHELLIA [so named by Micheli, in honour of Giov. Jeronymo Zannichelli, an apothecary at Venice, author of "Laboratorium Zannichellianum Chymicum," &c.] in Botany, a genus of the class monoecia, order monandria, natural order of inundatae, naiades (*Juss.*)—Generic Character. Male flower—Calyx none. Corolla none. Stamina: filament one, simple, long, erect. Anthers sagittate, ovate, erect. Female next the male flower.—Calyx: perianth one-leafed, ventricose, three-toothed. Corolla none. Pistil: germs four to eight, horned, converging. Styles as many, simple, spreading a little. Stigmas ovate, flat, spreading outwards. Pericarp: capsules as many, subfalcate, erect-spreading, beaked with a reclining style, tubercled at the back, crusty-coriaceous, compressed, one-celled, valveless. Seeds solitary, oblong, gibbous on one side. Male flowers solitary, scattered. Calyx: perianth one-leafed, with the mouth oblique, sharp behind, quite entire.—*Essential Character.* Male—Calyx none. Corolla none. Female—Calyx one-leafed. Corolla none. Germs four or more. Seeds as many, pedicelled. Stigmas peltate.

Zannichellia palustris, or horned pondweed.—Root annual, fibrous, very slender. It has the habit of a Potamogeton, slender and much branched, the stem leafy and smooth. Leaves somewhat whorled, growing two, three, or four out of the same sheathing stipule, linear, quite entire, acute, grass-like

like. Bracte axillary, tubular, membranaceous. Flowers two together within each bracte, one male, the other female.—Native of Europe and Virginia; flowering in June and July. Ditches and stagnant waters, near Pancras church; Bungay, in Suffolk, Cherry-Hinton, &c. Cambridgeshire; between Headington and the Wick, in Oxfordshire.

ZANNONE, a small island in the Tuscan sea, between the island of Ponza and the cape of Mount Circelli on the mainland.

ZANOJE, a settlement of New Granada, in South America, on the shore of the Guarico.

ZANONIA [so named by Linnæus, in memory of Giacomo Zanoni, prefect of the botanic garden at Bologna], in Botany, a genus of the class dioecia, order pentandria, natural order of cucurbitaceæ (*Juss.*)—Generic Character. Male.—Calyx: perianth three-leaved; leaflets ovate, spreading, shorter than the corolla. Corolla one-petaled, five-parted, spreading; segments acuminate, bent in, equal. Stamina: filaments five, spreading, length of the calyx. Anthers simple. Female on a distinct plant.—Calyx: perianth as in the male, placed on the germ. Corolla as in the male. Pistil: germ oblong, inferior. Styles three, spreading, conical, bent back, permanent. Stigmas bifid, curled. Pericarp: berry long, very large, truncate, attenuated at the base, surrounded with a curled suture towards the top, three-celled. Seeds two in each cell, oblong-round, in the centre of a lanceolate scale.—*Essential Character.* Calyx three-leaved. Corolla five-parted. Female—Styles three. Berry three-celled, inferior. Seeds two in each cell.

Zanonia indica.—Native of Malabar.

ZANOTTI (Francis Maria), a mathematician and philosopher, was born at Bologna in 1692, began his education among the Jesuits, and pursued a course of natural philosophy at the place of his nativity. Declining the prosecution of jurisprudence, to which he directed his first attention, he devoted himself to the study of philosophy, laying the foundation in an acquaintance with mathematics, and commencing with the works of Descartes and Malebranche. But being desirous of studying the works of Aristotle and Plato in the original language, he applied with diligence to acquire a knowledge of the Greek, so that he became able not only to read but to write it. Thus furnished, he obtained leave to give lectures in philosophy; in the course of which he instituted a comparison between the system of Descartes and that of Newton, avowing a decided preference to the latter; more particularly as it respects optics and astronomy. It was by his advice and under his direction, that Algarotti undertook to compose a popular treatise on light and colours. Declining to go to Padua for the purpose of giving lectures, he was appointed librarian to the Institute at his native place, and afterwards secretary, in which office he drew up in Latin an account of the transactions of the academy, with a history of its institutions, which he continued till the year 1766. This work was rendered peculiarly pleasing and instructive by the clearness of his arrangement, and the excellence of his style; in both which respects he seems to have formed himself on the model of Fontenelle. To these transactions he was himself a contributor; communicating a method of squaring different spaces of the hyperbola, and several important discoveries with regard to the circle, sphere, and circumscribing figures. Of these discoveries he transmitted an account to the Academy of Sciences at Montpellier, of which, as well as of the Royal Society of London, he had been elected a member. In his speculations on moral philosophy, he defended the Peripatetics against Maupertuis; and his adversary Ansaldo, in his "*Vindiciæ Maupertusianæ*," accused him of depreciating the Catholic religion, as he ascribed too great influence to the Stoic philosophy in alleviating the misfortunes of human life. This controversy gave occasion to many publications.

Zanotti was a poet as well as a mathematician and philosopher, and wrote verses both in the Tuscan and Latin languages; aiming, in imitation of the most celebrated poets of Italy, to blend the suavity of Petrarch with the energy and

vigour of Dante. Many of his Italian poems were published by Eustatio Manfredi; and some of his Latin elegies were edited by J. Antonio Vulpi; who says of them, that Catullus himself would not have been ashamed to acknowledge them. Both his Italian and Latin poems were afterwards published separately, first at Florence, and lastly at Bologna; and in this edition are contained imitations of Tibullus, Ovid, and Virgil, as well as of Catullus. After the death of Beccaria, Zanotti, whose modesty was no less conspicuous than his talents and acquirements, accepted the office of president of the Institute, which he deemed peculiarly honourable, as it was a token of esteem conferred upon him by his countrymen. Among the learned men with whom he maintained intercourses of friendship or correspondence were the famous anatomist Morgagni, Voltaire, and pope Benedict XIV. He died in the month of January, 1777. His works, besides those to which we have already referred, were numerous.

ZANOTTI (Giovanni Pietro), was born at Paris, though of Italian parentage, in 1674. He was sent young to Bologna, and became a pupil of Lorenzo Passinelli. Under that master he acquired an agreeable tone of colouring, a mellow pencil, and an intelligent acquaintance with the principle of the chiaro oscuro. He painted several altarpieces for the churches at Bologna, of which the most esteemed are, the Incredulity of St. Thomas, in the church of S. Tommaso del Mercato; the Resurrection, in S. Pietro; the Nativity, in La Purita; and a large picture in the palazzo pubblico, representing the ambassadors from Rome swearing fidelity to the Bolognese. He resided great part of his life at Cortona, where he also distinguished himself by several pictures painted for the churches, particularly Christ appearing to the Magdalen, Christ bearing his Cross, and the Murder of the Innocents.

Zanotti was a laborious and intelligent writer on art. Of his numerous publications the most considerable is his "*Storia dell' Accademia Clementina di Bologna*," published in two vols. 4to. in 1739. He died in 1765, aged 91. *Bryant's Dict.*

ZANOW, a small town of Prussia, in Pomerania; 42 miles north-by-west of New Stettin. Population 800.

ZANTE, the ancient *Zacynthus*, an island of the Mediterranean, forming a part of the Ionian republic, and situated at a short distance to the south of Cephalonia, and to the west of the ancient Elis, in the Morea or Peloponnesus. Its form is irregular; its length 15 miles; its breadth above 8; its circumference more than 30; its area about 160. In its aspect it is the finest of the Ionian islands, presenting, when viewed from the fort above the town of Zante, a prospect of vales and eminences richly cultivated, and covered with hamlets or villages, embosomed in olive plantations. The highest hill in the island is called Skopo, and the only plain of any extent bears the name of Chierri. Zante has no large rivulets, and in summer, considerable inconvenience is experienced, from the drying up of the springs and wells. The whole surface of the island presents the traces of subterraneous fire, discovered in some parts by warm sulphureous springs; in others by a degree of heat in the soil, which gives uncommon activity to vegetation. The springs of petroleum and mineral tar are worked to advantage. The coast is begirt with steep rocks, which in many places form recesses, answering in some degree the purpose of harbours. The climate, though extremely hot in summer, is not unwholesome. Like the neighbouring islands, Zante is subject to frequent shocks of earthquakes, but they are seldom attended with the loss of lives, and not always with the overthrow of buildings, though the latter took place to a considerable extent in 1820.

The chief products of Zante are currants, olives, and other fruits of a warm latitude (38. N.). Currants have long formed a great article of export to England and Holland; and the wines of Zante, if skilfully prepared, would be of good quality. Of olive oil, the annual produce is fully 32,000 barrels, each of about 130 lbs. On the other hand, the corn raised is hardly equal to four months consumption; and

and the deficiency is supplied by imports from the Morea, whither the peasantry of Zante resort in the harvest, to the number of 4000 or 5000, and receive payment for their labour, in corn, of which they bring back with them, on an average, not less than 50,000 bushels. Cotton and silk are cultivated to a small extent; and pasturage is very scanty, in consequence of the droughts of summer. Goats are the only live stock. The soil of this island being so fertile, the population is much more dense than in other parts of Greece. The total of the island is about 40,000, being 250 persons to the square mile. Of these, above 16,000 reside in the town of Zante; the rest in villages, hamlets, and scattered habitations, many of which are pleasantly situated along the coast. The language of the town, for the purpose of intercourse with foreigners, is Italian; but the current language is Greek. The dress of the Zantiotes presents a similar mixture of Italian and Greek fashions. Here are some manufactures of woollens; also of liquors. The island fell into the hands of the British, in October, 1809. It has communication by packets with Malta, Corfu, and the mainland of Greece. It sends seven deputies to the Ionian parliament, and is similar in mode of government, to the other islands of that republic.

ZANTE, the *Zacynthus* of the ancients, the capital of the foregoing island, is situated on the eastern coast, about 12 miles nearly west of Cape Tornese, in the Morea. It is the largest town of the republic, containing between 16,000 and 18,000 inhabitants. It is pleasantly situated at the bottom of a small bay, and on a hill of so gentle a declivity, as to descend in an almost imperceptible slope, to the surface of the sea. In its appearance, Zante resembles an Italian town. The principal street, which traverses it in its whole length, is broad and handsome: it is bordered with well built houses and churches, some supported by colonnades; others provided with piazzas, which, in a sultry climate like this, are of incalculable benefit. It has likewise the advantage, so rare on the continent, of a foot pavement. The marketplace, situated near the sea, is spacious and well laid out: it serves the double purpose of an exchange for the merchants during the day, and of a public promenade during the summer evenings. The houses of Zante are built, partly of brick, partly of wood; and, on account of the frequency of earthquakes, seldom exceed one or two stories in height: the last visitation of this kind, in 1820, overthrew several hundred houses, without, however, causing a loss of lives. Zante partakes of the character of a commercial town, comfort being more studied than elegance, and there being no public amusements, except billiards, and occasionally a theatrical representation by Italian players. Of the churches, several are well built, but none particularly striking. The harbour is capacious, but was not accounted safe for large vessels during the winter gales, until the erection of a mole or jetty. Quarantine is performed at a distance of two miles from the shore, and under the guns of the fort, which stands to the north-west, on the top of an eminence. The environs of Zante are extremely pleasant and picturesque.

ZANTOMISL, a town of Prussian Poland; 20 miles east-south-east of Posen. Population 900.

Z'ANY, *s. Insanus*.—A fool, a ninny. [Mr. Horne Tooke has observed, that *zany* and *nizy* are both from the same Italian word, viz., *sanese*; *zany*, from the former, and *nizy* from the latter part of the word; and that *Sanese*, or a native of *Sienna* in Italy, was equivalent to a fool, may be learned from many Italian books, as well as by conversation with the Florentines. He accordingly refers to some Italian comedies in proof. Poggius mentions a native of *Sienna* thus: "Pasquinus *Senensis*, vir dicax ac jocosus." Facet. p. 468.] One employed to raise laughter by his gestures, actions, and speeches; a merry Andrew; a buffoon.

Then write that I may follow, and so be
Thy echo, thy debtor, thy foil, thy *zany*;
I shall be thought, if mine like thine I shape,
All the world's lion, though I be thy ape.

Donne.

To Z'ANY, *v. a.* To mimic.
Vol. XXIV. No. 1674.

All excellence

In other madams does but *zany* hers. *Beaum. and Fl.*

Laughs them to scorn, as men doth busy apes

When they will *zany* men.

Marston.

ZANZIBAR, an island in the Indian ocean, near the coast of Africa, about 45 miles in length, and 15 in breadth. It has an excellent harbour on the western shore, abreast of the town. The island is difficult of approach, on account of a very strong current. The eastern coast is bold and woody; but the hills are not sufficiently high to interrupt the course of the sea breeze, which blowing over the whole island, renders it tolerably healthy. The inhabitants are Mahometan Arabs, governed by a sheik, appointed by the imam of Mascat. He has about 100 native troops under his command; but the island is said to be in a very defenceless state. It carries on a considerable trade with the Isle of France, Madagascar, and the Arabian Gulf. It exports slaves, gums, ivory, antimony, and blue vitriol; and imports arms, gunpowder, cutlery, coarse Indian cloths, and Spanish dollars. Small vessels, called dows or grabs, of 200 tons burden, are built on the island. It is plentifully supplied with water; and provisions are cheap and abundant.

ZANZOUR, a village of Tripoli; 15 miles west-north-west of Tripoli.

ZAOIE, a village of Upper Egypt, on the Nile; 13 miles north of Benisuef.

ZAPALLOS, a river of New Granada, in the province of Pastos, which runs east, and enters the Caqueta.

ZAPANGAS, a settlement of Costa Rica, on the coast of the Pacific ocean, near Cape Blanco.

ZAPANQUI, a settlement of Peru, in the province of Sicasca.

ZAPARAS, a settlement of the Caraccas, in the province of Maracaiho, on the east coast of Lake Maracaibo.

ZAPATERO, a small island, situated in the Lake Nicaragua, near the west coast.

ZAPATILLA LAGOON, a bay on the east coast of Yucatan. Lat. 18. 52. N. long. 89. 32. W.

ZAPATOSA, a lake of New Granada, in the province of Santa Martha, formed from the various rivers which rise in the Snowy mountains.

ZAPOPAN, a town of Mexico, in the province of Guadalupe; 7 miles north-west of Guadalupe.

ZAPOTE, or ZAPOTE YACU, a river of South America, which enters the Casavatay, in Lat. 5. 11. S.

ZAPOTE, a settlement of Peru, in the province of Caxamarca.

ZAPOTECAS, SAN ILDEFONSO DE LOS, a city of Mexico, in the province of Oaxaca.

ZAPOTITLAN, a settlement of Mexico; 62 miles south-east of Puebla de los Angeles.

ZAPOTLAN, a settlement of Mexico, in the province of Valladolid; 105 miles west of Valladolid. Lat. 20. 10. N. long. 104. 36. W.—It is also the name of several other inconsiderable settlements in Mexico.

ZAPPOLINO, a small town of Italy, in the territory of Bologna.

ZAPUESA; a settlement of New Granada, on the shore of the Lake Zapatosa.

ZAQUALCO, a settlement of Mexico, in the province of Valladolid. It contains 200 families of Spaniards, mestizoes, and mulattoes, and 300 of Indians.

ZAQUALPA, a town of Mexico, in the province of Puebla de los Angeles. It contains 240 Indian families, 100 of Spaniards, mestizoes, and mulattoes; 90 miles south-east of Mexico.—There is another settlement of the same name, containing 109 Indian families.

ZARA, the capital of Austrian Dalmatia, situated on the shore of the Adriatic; 90 miles south-south-east of Fiume. It stands on a point of land which runs out into the sea, and forms an excellent harbour, capable of containing a whole fleet. It is strongly fortified. Outside of the walls are the ruins of an ancient aqueduct, of the time of Trajan, with a number of inscriptions. Zara has several good edi-

8 R

fices.

faces, in particular the cathedral, the churches of Saints Grisogono, Catherina, Dominic, Dimitri, and Antony. These churches contain a number of good paintings. The public establishments are a gymnasium, a high normal school, the government offices, the courts of appeal, and an archbishop's see for the kingdom of Dalmatia. The language of the middle and upper classes is Italian. The distilled water called *ros solis*, made at this place, is in high repute. Lat. 44. 2. 25. N. long. 15. 9. 32. E. Population 8000.

ZARA, a circle of Austrian Dalmatia. Its area is 2150 square miles, with 105,000 inhabitants.

ZARAGOCILLA, a settlement of New Granada, in the province of Carthagená.

ZARAGOZA, a city of New Granada, in the province of Antioquia, between the rivers Cauca and Magdalena, and on the shore of the Nechi. Its climate is so unhealthy, that its inhabitants are reduced to 200 housekeepers.

ZARAKA, a small town of the Morea, with a lake now called Zaraka, anciently called Stymphatus.

ZARAOUNIZA, a small town of Austrian Dalmatia, near Spalatro.

ZARATA, a settlement of Peru, in the province of Larecaxa, near the river Beni.

ZARATA, a settlement of New Granada, in the province of Santa Martha, on the Magdalena. Lat. 9. 46. N.

ZARBE, a river of New Granada, in the province of Los Marquetones, which enters the Magdalena.

ZARCA, a village of Lower Egypt, on the Nile; 10 miles south of Damietta.

ZARCO, an inland town of European Turkey, in Thessaly, situated on the celebrated river Peneus, which is here in the middle of its course, and the vale of Tempe is nearly 30 miles to the east; 16 miles west-by-north of Larissa. Population 5000.

ZAREVO-KOKSCHAIK, an inland town of European Russia, in the government of Kazan, on the Little Koks-chaga; 100 miles west-north-west of Kazan. Population 5000

ZAREVO-SANTSCHURSK, a town of European Russia, in the government of Viatka, on the Koks-chaga, with 3200 inhabitants.

ZARGEZ, a market town of Hungary, in the circle of Trentzin.

ZARIPA, a river of the Caraccas, in the province of Maracaibo, which enters the Apure.

ZARLINO (Giuseppe da Chioggia), maestro di capella of St. Mark's church at Venice, and the most general, voluminous, and celebrated theorist and writer on music in the Italian language during the 16th century, was born in 1540, and author of the following musical treatises, which, though separately printed, and at different periods, are generally bound up together in one thick folio volume:—"Institutioni Harmoniche," Venice, 1558, 1562, 1573, and 1589; "Dimostrazioni Harmon." Ven. 1571, and 1589; and "Sopplimenti Musicali," Ven. 1588. We discover by these dates, that Zarlino first appeared as an author at the age of 18; and from that period till he had arrived at 49, he was continually revising and augmenting his works. He died in 1599.

ZARISZYN, a town of European Russia, in the government of Saratov; 212 miles south-south-west of Saratov, and 238 north-west of Astracan. Lat. 48. 42. 20. N. long. 44. 28. E. Population 2300.

ZARKI, a town of Poland; 43 miles north-north-west of Cracow. Population 2300.

ZARNATA, a small town of Greece, in the Morea; 16 miles south-west of Misitra, the antient Sparta.

ZARNICH, *s.* A substance in which orpiment is found; it approaches to the nature of orpiment, but without its lustre and foliated texture. The common kinds of *zarnich* are green and yellow. *Hill.*

ZARNICH, the name of a genus of fossils, the characters of which are these: They are inflammable substances, not composed of plates or flakes, but of a plain, simple, and uniform structure, not flexible nor elastic, soluble in oil, and

burning with a whitish flame, and noxious smell, like garlic

ZARNOWIETZ, a town of Poland; 30 miles north of Cracow. Population 800.

ZARUMA, or SARUMA, a town of Quito, in the province of Loxa. It was formerly very populous, being surrounded by rich mines, which have been worked without intermission from the time of their first discovery. They are now much exhausted; but the city still contains 6000 inhabitants. It is situated about 1600 yards above the level of the sea. The climate is hot and unhealthy; 30 miles north-west of Loxa. Lat. 3. 37. S. long. 79. 33. W.

ZASHIVERSK, a place in the northern part of the government of Irkoutsk, in Asiatic Russia, consisting of 5 Russian houses, and 21 colleges. Lat. 67. 30. N. long. 138. 45. E.

ZASMUCK, or ZASMUKY, a town of Bohemia; 30 miles east-south-east of Prague. Population 1000.

ZATAS, a river of Portugal, which rises near Elvas, in the province of Alentejo, and falls into the Tagus, in Estremadura.

ZATOR, a small town of Austrian Poland; 22 miles west-south-west of Cracow.

ZAVALETA, a settlement of New Granada, in the province of Antioquia.

ZAVATARELLO, a town of Italy, in the Sardinian states, with 1700 inhabitants; 18 miles east of Tortona.

ZAURA, a river of Guiana, in the district of Surinam, which enters the Cuyuni.

ZAWEH, a name given to a district of Korassan, in Persia, on the eastern coast of the Caspian.—There is a small town of the same name; 45 miles north-north-east of Askabad.

ZAWICHOST, a town of Poland, on the Vistula; 10 miles north-north-east of Sendomir. Population 900.

ZAWIEH, a village of Diarbekir, in Asiatic Turkey, on the Euphrates.

ZAYTE, a river on the west side of the island of Celebes, which runs into the sea. Lat. 0. 30. N. long. 120. 15. E.

ZAY-UGORCZ, a market town of Hungary, in the county of Trentschin, with manufactures of woollens.

ZAYULA, a town of Mexico, and capital of a jurisdiction of the same name. It has a magnificent convent; 245 miles west with a slight elevation south, of Mexico. Lat. 19. 2. N. long. 103. 28. W. Population 500 families of Spaniards, mestizoes, and Indians.—There are two other insignificant settlements of the same name in Mexico.

ZAYULTEPEC, a settlement of Mexico, in the province of Oaxaca, containing 140 families.

ZAZIVNOI, a fortress of Asiatic Russia, in the government of Oufa, on the Oural; 68 miles west of Orenburg.

ZBARAZ, a small town of Austrian Poland, on the borders of Russia, and 40 miles north of Bracklaw.

ZBRASLAWITZ, a small town of Bohemia; 10 miles south-west of Czaslaw.

ZDECHOWITZ, a large village of Bohemia, in the circle of Beraun.

ZDUNY, a town of Prussian Poland, on the borders of Silesia; 39 miles north-north-east of Breslau. In 1789 it suffered greatly from a fire. Population 3500.

ZEA, *s.* A kind of corn. *Chambers.*

ZEA [of Pliny, from the Gr. *ζεια* of Dioscorides. Derivation unknown], in Botany, a genus of the class monoecia, order triandria, natural order of gramina, gramineæ (*Juss.*)—Generic Character. Male flowers disposed in distinct loose spikes.—Calyx: glume two-flowered, two-valved; valves ovate-oblong, ventricose, awnless, acuminate; outer a little longer. Corolla: glume two-valved; valves oblong, awnless almost the length of the calyx; outer ventricose obtuse; inner two-toothed at the tip. Nectary two-leaved; leaflets fleshy, wider above, truncate, grooved at the top, very short. Stamina: filaments three, capillary. Anthers subprismatic, bifid, opening at the top. Females in a very close spike below the males, on the same plant, covered with leaves.—Calyx: glume one-flowered, two-valved, permanent; valves roundish, thick, membranaceous at the edge, ciliate; outer thicker.

thicker. Corolla: glume four-valved, valves unequal, membranaceous, hyaline, wide, short, permanent. Pistil: germ very small. Style filiform, longest of all, pendulous. Stigma simple, pubescent towards the tip. Pericarp none. Common receptacle very large, long, five-cornered, marked with five rows of transverse excavations, in each of which two fruits are immersed, surrounded with their proper calyx and corolla. Seeds solitary, roundish, angular at the base, compressed, longer than the glumes, pedicelled.—*Essential Character.* Males in distinct spikes.—Calyx: glume two-flowered, awnless. Corolla: glume two-flowered, awnless. Female—Calyx: glume one-flowered, two-valved. Corolla: glume four-valved. Style one, filiform, pendulous. Seeds solitary, immersed in an oblong receptacle.

Zea may, or Indian corn or maize.—There are four varieties. The first of these grows naturally in the islands of the West Indies; and has a very large strong stalk, rising the height of about ten or twelve feet. The leaves are long, broad, hang downward, and have a broad white midrib. The male flowers come out in branching spikes at the upper part of the stalks; these are eight or ten inches long. The female flowers come out from the bottom of the leaves on the side of the stalk; they are disposed in a close long thick spike. When the seeds are ripe, the spikes or ears are nine or ten inches long, and sometimes a foot; but these rarely ripen in England.

The second is cultivated in Italy, Spain, and Portugal. The stalks are more slender, and seldom more than six or seven feet high.

The third is cultivated in North America and Germany. The stalks are slender, and seldom rise more than four feet high. The leaves are shorter and narrower than either of the former; they are hollowed like the keel of a boat, and their tops hang down. This ripens its grain perfectly well in England, in as little time as barley.

There are several varieties of the two last, differing in the colour of the grain.

Maize is seldom cultivated in England for use; but in Italy, Germany, and North America, it is the food of the poor inhabitants. We may add the South of France, Barbary, China, Cochinchina, and Japan. It is much cultivated in the West Indies; in Jamaica in all parts, among the young canes.—This plant is an annual; native of America.

Propagation and Culture.—In North America it is treated in the following manner. They first dig the ground well in the spring, and having made it level, they draw a line across the whole piece; then they raise little hills at about three or four feet distance, into each of which they put two or three good seeds, covering them about an inch thick with earth. The rows are four feet asunder, and the hills three or four feet distant from each other. Six quarts of seed is allowed to an acre, which, if the soil be good, will produce fifty bushels of corn.

ZEAL, *s.* [from the Gr. ζηλος, *zelus*, Latin.] Passionate ardour for any person or cause.—*Zeal*, the blind conductor of the will. *Dryden*.—Good men often blemish the reputation of their piety by over-acting some things in their religion; by an indiscreet *zeal* about things wherein religion is not concerned. *Tillotson*.

To **ZEAL**, *v. n.* To entertain zeal. *Not in use.*—Stiff followers, such as *zeal* marvellously for those whom they have chosen for their masters. *Bacon*.

ZEAL, MONACHORUM, a parish of England, in Devonshire. Population 624.—2. **SOUTH**, a hamlet in the above county.

ZEALAND, a province of the Netherlands, which comprises the antient county of Zealand, and Dutch Flanders, and is bounded on the west by the sea, on the north by Goree and Overflaake, and on the east and south by Brabant and Flanders. The chief part of this province consists of islands at the mouth of the Scheldt, viz. Schouwen, Duiveland, Tholen, Walcheren, North and South Beveland, and Wolfersdyk. The continental part is merely a strip lying along the south bank of the Hond or West Scheldt. The

area of of the whole is little more than 570 square miles, but the population is about 111,000. The surface is level throughout, and lies so low, that it is necessary to protect the country from storms by large dykes, which run along the coast and the sides of the rivers, and are kept up at great labour and expense. The only exceptions are some small parts of the islands of Walcheren and Schouwen, where the sea has thrown up sand-banks or downs. These dykes are from 20 to 30 yards in breadth at the bottom, and of sufficient width at the top for two carriages to pass abreast. Yet different parts of this province have been at times exposed to heavy calamities, from the sea breaking over the dykes in storms at high tides, particularly in 1302, 1309, 1522, 1532, and 1548. In these catastrophes whole towns and districts have been overflowed and abandoned; and though part of them have been subsequently recovered, several islands have undergone a permanent reduction; in particular, that of Schouwen, which is said to have once been 60 miles in circumference, is now only 25.

The soil of Zealand is a rich black mould, excellent for pasturage and the culture of such crops as madder, flax, and cole seed, which require a very heavy soil. Wheat is raised chiefly in South Beveland. The air is damp, not from fog, but from exhalations from the fresh water in the ditches, water-courses, or canals. This affects even the health and longevity of the natives. To foreigners it is productive of bilious complaints and agues, as was so severely experienced by our troops in 1809. The Zealanders on the islands are strictly Dutch; on the mainland they are a mixture of Dutch and Flemings. They resemble the inhabitants of the rest of the United Provinces, in their industry, perseverance, and phlegmatic turn. The majority are Calvinists, but there is also a number of Catholics and Lutherans, and some Menonites or Anabaptists. Zealand carries on a very considerable trade, and exports large quantities of corn, madder, flax, salt-meat, linen yarn, rape-seed, and oil. The province is divided into three arrondissements and fifteen cantons: its chief towns are Middleburg, Flushing, and Zieric Zee. It sends three deputies to the states general. Its provincial states consist of 44 members, of whom 6 are for the knights, 20 for the towns, and 18 for the country.

ZEALAND, the largest of the Danish islands, is situated between the Cattegat and the Baltic, and is separated from Sweden by the Sound, and from Funen by the arm of the sea called the Great Belt. It extends from 55. 2. to 56. 8. north latitude; has an area of 2600 square miles, with 310,000 inhabitants; and contains the Danish capital Copenhagen. The surface of this island resembles that of the adjacent Danish islands, in being entirely without mountains; but instead of being, like several of them, a dead flat, it is finely variegated, having small hills and fields, intersected by canals, which, in summer, when the air is clear, and the ground covered with vegetation, would remind a native of Lombardy of his native country. Such are, in particular, several tracts along the Sound, the Isefiord, and the Cattegat: also the environs of Soroe in the interior. Unluckily the great road that crosses the island from Copenhagen to Funen, passes through the least varied part of the whole.

The soil of Zealand is as rich as the appearance is agreeable. It abounds in corn, particularly barley; also in good pasturage, and exports both grain and cattle. The horses are small, but spirited. Wood is also plentiful, except in the middle of the island, where it is necessary to use turf for fuel. Fish abounds in the numerous bays and creeks with which the island is indented in every direction. Here are also concentrated most of the manufactures and trade of Denmark; but for these we refer to *Copenhagen* and *Denmark*. Zealand is not included in any bishopric, like the rest of Denmark, but forms an ecclesiastical superintendency. In a political sense, it is governed by a grand bailiff, and is subdivided into the bailiwicks of Copenhagen, Fredericksburg, Holbeck, Soroe, and Præstoe.

ZEALAND, NEW, two islands in the South Pacific ocean, first discovered by Tasman. In the year 1642 he traversed the

the eastern coast from lat. 34. to 43., and entered the strait called Cook's strait. He was attacked by the natives soon after he came to an anchor, in the place to which he gave the name of Murderer's bay, and never went on shore: he gave the country the name of Staaten Land, in honour of the States General; and it is now generally distinguished in our maps and charts by the name of New Zealand. It was supposed, from the period of its first discovery to the time of the enterprising captain Cook, that the strait entered by Tasman separated an island from some vast southern continent; but the British navigator, who sailed round both islands in the years 1769 and 1770, has completely removed this geographical error. The two islands that go by the name of New Zealand are situated between the latitudes of 34. 22. and 47. 25. S., and between the longitude of 166. and 180. E. The northernmost of these islands is called by the natives Eaheinomaue, and the southernmost Tavai, or Tovy Poenamoo. Upon referring to the map of this country, it will be seen that Eaheinomaue, or the northern island, running from the North Cape, which is in lat. 34. 20. S. to Cape Palliser, in 41. 36. S., contains 436 miles in length; and taking the medium breadth, which varies from five miles at Sandy bay to 180 at the East Cape, at about 60 miles, this extent will include 26,160 square miles, or 16,742,400 square acres; while Tavai Poenamoo, the southern island, extending from 41. 30. to 47. 25. S., stretches 360 miles in length, and estimating its medium breadth at 100 miles, contains not less than 36,000 square miles, or 23,040,000 square acres. These islands, therefore, taken together, will give an area of 62,160 square miles, or 39,782,400 square acres. Such is the calculation made of the dimensions of these islands by Mr. Nicolas, who visited them in the years 1814 and 1815, for the purpose of establishing missionaries among the natives. The general face of the country, as far as they had an opportunity of exploring it, is undulating; and the hills rise with a varied ascent, from inconsiderable eminences to lofty mountains. A continued chain of hills runs from the North Cape to the river Thames, and extends, as would appear from Captain Cook's survey, through the whole country, from north to south; while, in taking the latter direction, these hills gradually swell into mountains, the highest of which, according to Dr. Forster, is Mount Egmont, lying in lat. 39. 16. S., long. 179. 45. E., and said to resemble in its appearance the peak of Teneriffe, being also of the same elevation. The whole of the northern island, if we except a few spots on the western side, appears admirably well adapted for the purposes of cultivation; but the southern island is described by Captain Cook as mountainous, and apparently barren. Even here, however, the astonishing height of the trees found growing upon it, as well as their great abundance, would seem to indicate a fertile soil. Mr. Nicolas mentions, that, in their excursions into the interior of the northern island, they found that the soil varied in its quality, but generally appeared extremely fertile. The hills were composed, for the greater part, of a stiff clay; and the vallies consisted of a black vegetable mould, producing fern of the most luxuriant growth; while the swamps, occasionally met with, were of trifling extent, and might be drained with little trouble or expense. Everywhere a fine rich verdure met the eye, and gave a favourable impression of the genial influence of the climate. From the accounts of the missionaries, who visited the Bay of Islands in the midst of winter, and from the observations of Mr. Nicolas during the summer, there does not appear to be in any country in the world a finer or more constant climate, than in this part of New Zealand. Though not removed farther than 11 degrees from the tropics, where the rays of the sun fall vertically, the heats were never found during the summer months to be excessive, or unfavourable to vegetation; and the air was so delightfully bland and healthful, as to act powerfully on the spirits. The thermometer ranged between 74°, its height in summer, and in winter fell during the day to 63°. The plantations looked as flourishing and green as they would in Britain in the latter end of spring, or in the

beginning of summer. This verdant and fertile appearance was not in the least diminished by the heats of summer; for there were occasionally soft and mellow showers that descended to refresh the lands, and several days of continual rain were also experienced. The herbage, therefore, never for a moment lost that rich freshness so pleasing to the eye of the beholder, and the prospect in every direction was cheering and attractive. The mildness of the climate in this part of the country appears equally to extend to that bordering on Queen Charlotte's sound, where the vegetables which Captain Cook had sown in a previous visit, were found by him on his return remarkably vigorous; having stood the winter without being otherwise affected by it than as it added to their strength; though, if left exposed during the same season in England, they must certainly have perished. In this part, notwithstanding that it lies as far south as 41°, and in the vicinity of the snow mountains, yet no frost could be seen during the time the Resolution and Adventure remained here, which was till the 6th of June, almost the very depth of winter. The climate, at the further end of the southern island, must, from its situation, partake of a much greater degree of cold than the other parts, and is subject, it appears, to heavy and continued rains; for Captain Cook observes, that "during the stay the Resolution made in Dusky bay, which was for six weeks and four days, only one week of continued fair weather was experienced, and all the rest of the time the rain predominated, insomuch that they never experienced above two fair days in immediate succession; but notwithstanding which (he adds) the crew recovered their health very fast; and perhaps the climate was less noxious to Englishmen, than it would have been to any other nation, from being so analogous to their own."

From the remarks here offered, it will be seen that the climate of New Zealand, taking the country through its whole extent, is mild and temperate, and consequently particularly favourable to the growth of whatever productions the soil may be adapted to yield. New Zealand, thus favoured with a fertile soil and fine climate, is rich in various natural productions, some of which are extremely valuable. In the vegetable kingdom there is no production that is so much calculated to strike the traveller with admiration as the trees of amazing growth, which rise in wild luxuriance all over this country. Pines of different descriptions, and which are utterly unknown to Europeans, are here to be met with, of a height which leaves no similarity between them and the tallest that ever grew on the mountains of Norway; and those species which bear the uncouth names of the cowrie, the totarra, the towha, and the zarida, afford such a supply of valuable timber as the profusion of some ages to come will not be able to exhaust. Here are also several kinds of trees of inferior growth, though not less excellent in their quality; and many of them are admirably well adapted for ornamental works requiring a fine grain, the wood being of this nature, and susceptible of a high polish. According to the different situations in the country, the timber appears to vary. "Thus, (says Dr. Forster,) a fine tree at Dusky bay, or the southern extremity (Tavai Poenamoo), which there grows in the lowest part of the country, dwindles to a small inconsiderable shrub at Queen Charlotte's sound, or the northern end, where it is only seen on the highest mountains." But this difference is not to be ascribed to the soil, else the reverse would be the case, and the timber would grow to a larger size in the northern quarter, as being the most fertile, and would be stunted in the opposite direction; it is caused only by the variations of the climate happening to be more favourable to those particular species of trees in different degrees of temperature. The trees which the natives chiefly make subservient to their purposes, are, besides the different species of pine above mentioned, the henow, from which they extract a black dye; the towha, a tree resembling the sycamore; the *river river*, the grain of whose wood is similar to that of the beech; a species of the cork-tree, called by these people vow; a large tree named eckoha, and another termed kykata, a tall and beautiful tree, together with many others

others which are both curious and serviceable. The supplejack is to be met with in all parts of the woods; and there is here also a species of the myrtle, similar to that found in various parts of New South Wales. Another species of it grows in the country about Dusky bay, an infusion of which was drunk by the crew of the Endeavour, as a substitute for tea. The leaves of this shrub have a pleasant aromatic flavour at the first infusion, but yield a strong bitter when the water is poured on them a second time. In the thick forests, where it is sheltered from the weather, this shrub becomes a considerable tree, growing frequently to the height of 30 or 40, and even 60 feet, and it frequently proved a great obstruction to Mr. Nicolas and those who accompanied him, in their progress through the forest. In New Zealand there are no trees that yield a fruit fit to be eaten by Europeans; though there are some few which the natives themselves prize very highly for the sort they produce. But fructiferous trees of any description are here very scarce, and perhaps not more than three or four species could be found in the country. Besides the common fern, which supplies the natives with their ordinary food, there is here likewise the fern-tree, so called from having its leaves similar to those of that weed; and which also affords them an edible substance. The part of it eaten by these people is the root, which they bake between hot stones, in the same manner as they dress their potatoes; and when thus prepared, its flavour is considered better than that of a turnip. In the centre of this tree is found a tender pulp, which is extremely succulent, yielding, when cut, a juice of a reddish colour. The native herbage of this country, as far as could be perceived by those who visited it, is confined to a few species; and there are two principal obstacles here to the growth of any kind of grass in the forest lands: the first is, the rank exuberance of the trees, which infects the soil; and the next, the exclusion of the rays of the sun, by the impenetrable thickness of the foliage; so that the woods afford nothing that can serve as pasturage for cattle. The herbaceous productions indigenous to the country are, wild celery, canary grass, wild parsley, plantain grass, a species of ray-grass, the *ensata* or flag, the phormium tenax, or flax-plant, and a species of the fern. The esculent roots cultivated by the natives, and which have been given to them by Europeans, are the potatoe, the cabbage, the turnip, and the *tacca*, a species of the yam. The only grain they have in the country is a little Indian corn, which they have likewise received from European navigators, as well as the pumpkin or gourd; and this they cultivate for the purpose of converting it into drinking vessels.

The animal kingdom in New Zealand, includes but few species, and the quadrupeds in particular are very scarce, amounting only to five, a rat, a small bat, the sea-bear, or ursine seal; the fourth, the animal called by lord Anson the sea lion; and the guana, or lizard. The birds, though not so numerous as in some other parts, are still deserving of consideration, some of them possessing both a melodious voice and a beautiful appearance. The pue, with its pendent tufts of white feathers, charms with its delightful notes the romantic wilds of New Zealand. The parrot and parroquet are also to be seen, of different species; also a small bird resembling the sparrow; and a singular species of duck, having the beak, legs, and feet, of a bright red, the eyes encircled with a rim of the same colour, and the body of a fine glossy black. The wild duck was observed in the marshy grounds, and on the banks of the rivers; also some small birds of the most beautiful plumage. The feathers of the cassowary were also seen on the garments of some of the chiefs; but the bird itself was not seen by the missionaries. Among the sea-fowl which are generally to be met with upon the coast, were observed the shag, the gannet, the albatross, and three or four species of the petrel. In Dusky bay the small birds are represented as being exceedingly numerous; and they were found by captain Cook's party so very tame and unacquainted with the presence of mankind, that they betrayed no distrust whatsoever, and even hopped on the ends of the fowling-pieces. There was shot in this bay a white heron,

that answered exactly to the description given by Pennant, in his British Zoology, of a bird formerly found in England. Towards the southward there are also water hens of a large species, rails in vast numbers, cormorants, oyster-catchers or sea-pics, penguins, and some other sorts of aquatic birds. From this part of New Zealand 37 new species of birds were brought away on the return of captain Cook. The country will now have to boast of every species of domestic fowl known in Europe; for the missionaries, who have now established themselves in the island, took with them great numbers of turkeys, geese, ducks, and common fowl; so that, in the course of a few years, these will be numerously propagated, and supply the natives with a new article of diet. The insects are not supposed to be numerous. Those observed were the beetle, the flesh-fly, the common fly, and a small sand-fly, which proved exceedingly troublesome. Few mosquitoes were to be seen. Around the coast there was the most remarkable abundance of fish; nor is the profusion more remarkable than the variety. Every creek swarms with fish, which are not only wholesome, but equally delicious with those of Europe. "The ship seldom anchored (says captain Cook) in any station, or, with a light gale, passed any place that did not afford us enough with hook and line to serve the whole ship's company, especially to the southward: when we lay at anchor, the boats with hook and line, near the rocks, could take fish in any quantity; and the seine seldom failed of producing a still more ample supply; so that both times when we anchored in Cook's strait, every mess in the ship, that was not careless and improvident, salted as much as lasted many weeks after they went to sea. Of this article the variety was equal to the plenty: we had mackerel of many kinds, among which, one was exactly the same as we have in England. These came in immense shoals, and were taken by the natives in their seines, who sold them to us at a very easy rate. Besides these, there were fish of many species which we had never seen before; but to all which the seamen very readily gave name; so that we talked here as familiarly of hakes, bream, cole fish, and many others, as we do in England; and though they are by no means of the same family, it must be confessed that they do honour to the name. But the highest luxury which the sea afforded us, even in this place, was the lobster, or sea cray-fish, which are probably the same that, in the account of lord Anson's voyage, are said to have been found at the island of Juan Fernandez, except that, although large, they are not quite equal in size. They differ from ours in England in several particulars; they have a greater number of prickles on their backs, and they are red when first taken out of the water. These we also bought every where to the northward, in great quantities, from the natives, who catch them by diving near the shore, and finding out where they lie with their feet. We had also a fish that Fregier, in his voyage to the Spanish Main in South America, has described by the names of elephant, peje gallo, or poison coq, which, though coarse, we ate very heartily. Several species of the skate, or stingray, are also found here, which are still coarser than the elephant; but as an atonement, we had, among many kinds of dog-fish, one spotted with white, which was in flavour exactly similar to our best skate, but much more delicious. We had also flat-fish, resembling both soles and flounders, besides eels and congers of various kinds, with many others, of which those who shall hereafter visit this coast will not fail to find the advantage; and shell-fish in great variety, particularly clams, cockles, and oysters."

New Zealand is supposed to have been peopled from some of the numerous islands scattered throughout the Indian ocean. The people are savage in their manners, and are addicted to all the vices belonging to their barbarous mode of life. Their government is a complete despotism. The chiefs rule over the multitude with the most despotic sway; they are also oppressed by their chiefs, who hold them in complete vassalage. The females, as in most savage countries, are held in a most degraded state, compelled by the men to undergo every sort of laborious drudgery, while they themselves loiter

away their time in idleness. They have many gross and revolting superstitions. No sooner does a person arrive at a certain stage of illness among them, than they place the unhappy creature under the wrath of the *Etua*; and incapable of accounting for the disease with which he is afflicted, as of applying a remedy to it, they can only consider it as a preternatural visitation of retributive justice, which it would be impious to resist by any human expedient. Many a poor sufferer who, with a little ordinary attention, might be soon restored to health and vigour, is devoted by this horrid superstition to perish in the very midst of his kindred, without a single effort being made for his recovery. But his death is not the only loss which the community sustains at the time it happens; his wife, though she durst not administer that simple aid which might have rescued him from a premature grave, is obliged to immolate herself at his dissolution, as an indispensable test of her faithful attachment. The islands being divided among a variety of petty chiefs, are continually involved in the most barbarous dissensions and bloody wars, carried on with all the malignity of savages. Being divided into rival associations, they are taught from their infancy to cherish a spirit of ferocious hostility against each other, and implacable vengeance becomes a necessary duty, to which they are reconciled by habit, while they indulge it without remorse. The New Zealanders, according to captain Cook, must live under perpetual apprehensions of being destroyed by each other; there being few of their tribes that have not, as they think, sustained wrongs from some other tribe, which they are continually upon the watch to revenge; and perhaps the desire of a good meal may be no small incitement. They will even preserve their enmity from father to son; and the son never loses sight of an injury done to his father. The method of executing their horrible designs is by stealing upon their enemies in the night; and if they find them unguarded (which, however, is but seldom the case) they kill every one indiscriminately, not even sparing the women and children; the dead bodies they either devour on the spot, or carry them home for that purpose. If they are discovered before they can execute their bloody purpose, they generally steal off; and sometimes are pursued and attacked by the other party in their turn. They never give quarter, or take prisoners. This perpetual state of warfare renders them so circumspect, that they are never off their guard, either by night or day. According to their system of belief, the soul of the man whose flesh is devoured by the enemy, is doomed to perpetual fire; while the soul of him whose body has been rescued, as well as those who die a natural death, ascend to the habitation of the gods. They do not eat the bodies of their friends who have been rescued. Their common method of disposing of the dead is by burying in the earth; but if they have more of their slaughtered enemies than they can eat, they throw them into the sea. They have no such thing as morais, or other places of public worship; nor do they ever assemble together with this view. But they have priests who alone address the gods in prayers for the prosperity of their temporal affairs. Their dress is formed of the leaves of the flag, split into slips, which are interwoven, and made into a kind of matting, the ends, which are seven or eight inches in length, hanging out on the upper side. One piece of this matting, being tied over the shoulders, reaches to the knees; the other piece, being wrapped round the waist, falls almost to the ground. These two pieces are fastened to a string, which by means of a bodkin of bone, is passed through, and tacks them together. The men wear the lower garment only at particular times. What they consider as the most ornamental part of their dress, is the fur of dogs, which they cut into stripes, and sew on different parts of their apparel. As dogs are not in plenty, they dispose these stripes with great economy. They have a few dresses ornamented with feathers; and one man was seen covered wholly with those of the red parrot. The women never tie their hair on the top of their head, nor adorn it with feathers; and are less anxious about dress than the men. Their lower garment is bound tight round them, except when they go

a-fishing, and then they are careful that the men shall not see them. The ears of both sexes are bored, and the holes stretched so as to admit a man's finger. The ornaments of their ears are feathers, cloth, bones, and sometimes bits of wood; a great many of them use nails, which were given them by the English for this purpose; and the women sometimes adorn their ears with the white down of the albatross which they spread before and behind the hole, in a large bunch. They likewise hang to their ears by strings, chisels, bodkins, the teeth of dogs, and the teeth and nails of their deceased friends. The arms and ankles of the women are adorned with shells and bones, or any thing else through which they can pass a string. The men wear a piece of green talc, or whalebone, with the resemblance of a man carved on it, hanging to a string round the neck. They anoint their hair with oil, melted from the fat of fish or birds. The poorer people use that which is rancid, so that their smell is very disagreeable; but those of superior rank make use of that which is fresh. They wear combs, both of bone and wood, which are considered as an ornament, when stuck upright in the hair. The men tie their hair in a bunch on the crown of their head, and adorn it with the feathers of birds, which they likewise sometimes place on each side of the temples. They commonly wear short beards; the hair of the women sometimes flows over the shoulders, and sometimes is cut short. Both sexes, but the men more than the women, mark their bodies with black stains called *Amoco*; in general the women stain only the lips, but sometimes mark other parts with black patches; the men, on the contrary, put on additional marks from year to year, so that those who are very ancient are almost covered. Exclusive of the *Amoco*, they mark themselves with furrows: these furrows make a hideous appearance, the edges being indented, and the whole quite black. The ornaments of the face are drawn in the spiral form, with equal elegance and correctness, both cheeks being marked exactly alike, while the painting on their bodies resembles filagree work, and the foliage in old chased ornaments; but no two faces or bodies are painted exactly after the same model. These Indians likewise paint their bodies, by rubbing them with red ochre, either dry or mixed with oil. The houses are from 16 to 24 feet long, 10 or 12 wide, and 6 or 8 in height. The frame is of slight sticks of wood, and the walls and roof are made of dry grass pretty firmly compacted. Some of them are lined with bark of trees, and the ridge of the house is formed by a pole, which runs from one end to the other. The door is only high enough to admit a person crawling on hands and knees; and the roof is sloping. There is a square hole near the door, serving both for window and chimney, near which is the fire-place. A plank is placed near the door, adorned with a sort of carving, and this they consider as an ornamental piece of furniture. The side walls, and roof, projecting two or three feet beyond the walls at each end, form a sort of portico, where benches are placed to sit on. The fire is made in the middle of a hollow square in the floor, which is inclosed with wood or stone. They sleep near the walls, where the ground is covered with straw for their beds. Besides the fern root, which serves them for bread, they feed on albatrosses, penguins, and some other birds. Whatever they eat is either roasted or baked, as they have no vessels in which water can be boiled. There were no plantations of cocoas, potatoes, and yams, to the southward, though there were many in the northern parts. The natives drink no other liquor than water, and enjoy perfect and uninterrupted health. When wounded in battle, the wound heals in a very short time, without the application of medicine; and the very old people carry no other marks of decay about them than the loss of their hair and teeth, and a failure of their muscular strength, but enjoy an equal share of health and cheerfulness with the youngest. The canoes of this country are not unlike the whale boats of New England, being long and narrow. The larger sort seem to be built for war, and will hold from 30 to 100 men: one of these measured near 70 feet in length, 6 in width, and 4 in depth.

depth. It was sharp at the bottom, and consisted of three lengths, about two or three inches thick, and tied firmly together with strong plaiting: each side was formed of one entire plank, about 12 inches broad, and about an inch and a half thick, which were fitted to the bottom part with equal strength and ingenuity. Several thwarts were laid from one side to the other, to which they were securely fastened, in order to strengthen the canoes. These vessels are rowed with a kind of paddles, between five and six feet in length, the blade of which is a long oval, gradually decreasing till it reaches the handle; and the velocity with which they row with these paddles is surprising: their sails are composed of a kind of mat or netting, which is extended between two upright poles, one of which is fixed on each side. Two ropes fastened to the top of each pole serve instead of sheets. The vessels are steered by two men, having each a paddle, and sitting in the stern; but they can only sail before the wind, in which direction they move with considerable swiftness. These Indians use axes, adzes, and chisels, with which last they likewise bore holes. The chisels are made of jasper, or of the bone of a man's arm; and their axes and adzes of a hard black stone. Their tillage of the ground is excellent, owing to the necessity they are under of cultivating or running the risk of starving. A long narrow stake, sharpened to an edge at bottom, with a piece fixed across, a little above it, for the convenience of driving it into the ground with the foot, supplies the place both of plough and spade. The soil being light, their work is not very laborious; and with this instrument alone they will turn up ground of six or seven acres in extent. Their fish-hooks are of shell or bone; and they have baskets of wicker-work to hold the fish. Their warlike weapons are spears, darts, battle-axes, and the patoo-patoo. The spear, which is pointed at each end, is about 26 feet in length, and they hold it in the middle, so that it is difficult to parry a push from it. Whether they fight in boats or on shore, the battle is hand to hand; their contest must be bloody.

Several missionary stations have been established in New Zealand, for the double purpose of civilizing the ignorant natives, and instructing them in the truths of the Christian religion; and the missionaries continue still struggling against the serious obstacles opposed to their progress, from the ferocious habits and superstitions of the natives, by whom they are frequently ill-treated and abused. It was in the year 1814 that the first missionary settlers were established among the New Zealanders, on the Bay of Islands, by the Rev. Samuel Marsden, well known for his unwearied perseverance in this enterprise, and for the skill with which he has conducted it. Many difficulties were encountered; but the settlers still continued their efforts. The settlements were again visited in 1819 by Mr. Marsden, when a tract of land, consisting of 13,000 acres, was purchased from one of the chiefs, and the missionaries were settled on it. He also undertook a journey across the island, on which he discovered a large river, making its way, with its tributary streams, into the sea on the opposite shore. This river he named Gambier. He has since visited the settlements, for the purpose of superintending and encouraging the missionaries. And several New Zealanders, who were brought to New Holland, and had there an opportunity of witnessing the arts and improvements of civilized life, have been of great service to the missions. On the part of the missionaries there has been no want of perseverance or of courage. But the warlike habits and savage manners of the natives oppose great obstacles to their exertions. They are in all respects savages, possess their characteristic cruelty, improvidence, and brutality—their hatred of industry—and their disposition to steal wherever they can. The missionaries having, of course, no force to oppose for their protection, are frequently maltreated by them and abused when they refuse to comply with their requests for iron tools, or any other article they may take a fancy to; and their lives do not appear to be in great security, stationed as they are among such a horde of merciless savages. They appear, however, undismayed; and are prosecuting their labours, both spiritual and temporal, with

the greatest assiduity. They are cultivating the ground for a subsistence, and have already ample store of excellent wheat; they have also turned their attention to the breeding of cattle, some of which have been imported from New Holland for their use; and they have several of the natives employed in the sawing of wood, in which the country abounds, and which affords an article of export to New South Wales. We cannot expect that, in the present generation, any great impression will be made, or that it will be easy to reclaim the natives from their inveterate attachment to savage habits: and one great obstacle to the planting of any new community in this country, on the principles of civilized life, seems to be the want of any protection. If an industrious society were beginning to flourish and to grow rich in this wilderness, what security have they against the insatiable cupidity of the wretches by whom they are surrounded? To improve the country, the missionaries ought to be protected; and if they were joined by a band of resolute colonists, who would protect their own rights, and at the same time respect the rights of the natives, this accession of strength would certainly greatly conduce to the steady progress of the settlement. They might then proceed in their labours, both spiritual and temporal, particularly the latter; for if the natives will not listen to their religious exhortations, it would still be of great importance to instruct them in the arts of civilized life; and by degrees the missionaries might draw to them European colonists, and thus form an industrious and thriving community. The progress they have already made, under so many discouragements and obstacles, is certainly astonishing. Among other enterprises, they have succeeded in reducing to writing the language of the natives, and have constructed a New Zealand grammar, for the benefit of such new missionaries as may be inclined to adventure on this field of missionary enterprise.

The population of New Zealand has been variously calculated, from 100,000 to 150,000.

ZEAL'D, *adj.* Filled with zeal. *Not in use.*—This good king's judgement was over-zeal'd. *Fuller.*

ZEAL-LESS, *adj.* Wanting zeal.—Look on your indelivotion, that heartless, zealless behaviour in this very house of God. *Hammond.*

ZEALOT, *s.* [*zeleoteur*, French; ζηλωτης, Gr.] One passionately ardent in any cause. Generally used in dispraise.—The fury of zealots, intestine bitterness, and division, were the greatest occasion of the destruction of Jerusalem. *King Charles.*

ZEALOTRY, *s.* Behaviour of a zealot.—No casuist is sufficient to enumerate or resolve the many intricate niceties, and endless scruples of conscience, which some men's and women's more plebeian *zealotry* makes; as about ladies' cheeks and faces, &c. *Bp. Taylor.*

ZEALOUS, *adj.* Ardently passionate in any cause.—It is not at all good to be *zealous* against any person, but only against their crimes. It is better to be zealous for things than for persons: but then it should be only for good things; a rule that does certainly exclude all manner of zeal for ill things, all manner of zeal for little things. *Sprat.*

ZEALOUSLY, *adv.* With passionate ardour.—To enter into a party as into an order of friars, with so resigned an obedience to superiors, is very unsuitable with the civil and religious liberties we so *zealously* assert. *Swift.*

ZEALOUSNESS, *s.* The quality of being zealous.

ZEAMAH, a river of Algiers, which falls into the Mediterranean; 6 miles south-south-east of Cullu.

ZEB, or **ZIB**, a village of Syria, near the sea-coast, 9 miles from Acre.

ZEBBEY, a town of the island of Malta, said to contain 4000 inhabitants.

ZEBDAINEH, a village of Syria; 14 miles north-west of Damascus.

ZEBEE, a considerable river which flows through the south of Abyssinia, and has been supposed to fall into the Arabian sea; but, according to the information obtained by Mr. Salt, it is lost in the sands.

ZEBEER, a village of Irak Arabi; 12 miles west of Bassora.

ZEBEN, a town of Hungary, on the river Tarza or Torissa; 25 miles north-north-west of Caschau. Population 2100.

ZEBID, a city of Arabia, once the capital of Yemen, and the seat of a most extensive trade; but since its port at Ghalefka has been choked up, this has been transferred to Mocha, and Zebid has fallen into a state of great decay. It has even become an employment of the people to sell the stones of the old edifices, for the purpose of being employed in new erections elsewhere. The old mosques and minarets still give to the place a magnificent appearance from a distance; and it is still distinguished by an academy, much resorted to by the youth of Yemen, for the prosecution of such sciences as are cultivated among Musulmen; 52 miles north of Mocha.

ZEBRA, *s.* An Indian ass, naturally striped. *Mason.*—The chiefs are generally clad in skins of lions, tygers, or zebras. *Hawkesworth.*

ZEBU ISLE, one of the Philippine islands, situated about the 123d and 124th degrees of east long. It is 108 miles in length, by 24 in breadth. It was here that Magellan fell, in a skirmish with the natives, in 1521.

ZE'CHIN, *s.* [From *Zecha*, a place in Venice where the mint is settled for coinage.] A gold coin worth about nine shillings sterling.

ZED, *s.* The name of the letter *z*.—Thou whoreson *zed*, thou unnecessary letter. *Shakspeare.*

ZEDDAM, a village of the Netherlands, in Gelderland. Population 1800.

ZEDLETZ, OLD, a town of Bohemia; 5 miles north-west of Hayd. Population 900.

ZEDOARY, *s.* [*zedoaire*, French.] A spicy plant, somewhat like ginger in its leaves, but of a sweet scent.—If some infrequent passenger crossed our streets, it was not without his medicated posse at his nose, and his *zedoary* or angelica in his mouth. *Bp. Hall.*

ZEDROS, a river of New Granada, in the province of Choco, which rises in the province of Popayan, and falls into the Pacific ocean.

ZEELEST, a village of the Netherlands, in North Brabant, with 1000 inhabitants.

ZEEVENBERGEN, a town of the Netherlands, province of Utrecht. Population 2800.

ZEGGO, a town of Central Africa, south of the Niger, on the caravan route from Cashna to Ashantee.

ZEGHAMA, a town of Darfur; 60 miles north of Cobbe.

ZEGEN, a poor village of Fezzan, on the southern border of the desert of Soudah; 65 miles north of Mourzouk.

ZEGMA, a small town of Diarbekir, in Asiatic Turkey, situated on the Euphrates.

ZEGZEG, a country and city of central Africa, situated to the eastward of Agadez.

ZEHDEN, a town of the Prussian province of Brandenburg, on the river Muglitz; 46 miles east-north-east of Berlin. Population 1000.

ZEHDENIK, a town of the Prussian province of Brandenburg. Here is a foundry for casting balls, bombs, and other military stores; 33 miles north of Berlin. Population 1600.

ZEHISTA, a village of Germany, in Saxony; 3 miles south of Pirna.

ZEHREN, a village of Germany, in Saxony, on the Elbe; 5 miles north-north-west of Meissen.

ZEIBO, an island or rock in the Atlantic ocean, near the coast of Yucatan.

ZEIDEN, a town of Transylvania, north-west of Cronstadt. Population 3200.

ZEIDLER, a village of Bohemia, in the circle of Leutmeritz, on the borders of Lusatia. Population 1000.

ZEILA, a seaport, capital of the kingdom of Adel, situated to the south of Abyssinia. It lies on the gulf of Aden, almost immediately beyond the straits of Babelmandel, and on a bay, great part of which is dry at low water. The inhabitants are Mahometans, and dependent upon Yemen. The place is the theatre of a considerable trade; and contains some good houses, though the greater part of the habi-

tations consist of poor cottages. Lat. 10. 45. N. long. 44. 20. E.

ZEISELMAUER, a small town of Germany, on the Danube; 11 miles north-north west of Vienna.

ZEISEN, an island of the Atlantic ocean, on the coast of New Granada, South America, and province of Carthagera. It is in the bay of Tolu, and lies farthest out of all the islands which form that bay.

ZEISKAM, a village of the Bavarian circle of the Rhine, near Spire. Population 1100.

ZEITHAYN, a village of Saxony, on the Elbe; 24 miles north-west of Dresden.

ZEITLARN, a large village of Bavaria, on the river Regen; 5 miles north of Ratisbon.

ZEITUN, SEITUN, or ISDIN, a town of Greece, in the sandgiacat of Egribos, at a small distance from the gulf of Zeitun. It is an open town, and contains 4000 inhabitants, who export silk, cotton, and corn, and participate in the transit trade from Larissa and Salonica, to the Morea. To the southward lies the famous pass of Thermopylæ; 48 miles south-by-east of Larissa. Lat. 39. 6. N. long. 22. 58. E.

ZEITUN, a town in the island of Malta, which, though little known beyond the limits of the island, contains 3900 inhabitants.

ZEITZ, an ancient town of Prussian Saxony, on the Elster; 16 miles east-south-east of Naumburg, and 67 west of Dresden. It contains 5400 inhabitants, and has some small manufactures of woollens, leather, and earthenware. It is surrounded with a wall, and contains a beautiful castle called Moritzburg, formerly the residence of the princes of Saxe-Weitz.

ZELANDIA, a fort built by the Dutch, in the colony of Surinam, on the shore of the river.

ZELANDY, a small island in the Eastern seas, near the west coast of Sumatra. Lat. 0. 53. N. long. 98. 14. E.

ZELAYA, a town of Mexico, in the province of Valladolid. Its streets are strait, well proportioned, and regular; 110 miles north-west of Mexico. Population 600. Lat. 2. 0. 38. N. long. 100. 30. W.

ZELE, a town of the Netherlands, in East Flanders; 14 miles east of Ghent.

ZELECHOW, a town of Poland, 50 miles south-east of Warsaw, with 1000 inhabitants.

ZELEH, a town of Asiatic Turkey, in the government of Sivas; 21 miles west-south-west of Tocat.

ZELLENIN, a small island in the Frozen ocean, near the south-west coast of Nova Zembla. Lat. 70. 50. N. long. 56. 24. E.

ZELENOIKOLOK, a fortress of Asiatic Russia, in the government of Caucasus, on the Oural.

ZELEZENSKAIA, a fortress of Asiatic Russia, in the government of Kolivan, on the eastern side of the Irtysch.

ZELHEM, a village of the Netherlands, in Gelderland; 12 miles south-east of Zutphen. Population 2200.

ZELL, or CELLE, a city of Germany, in Hanover, at the confluence of the rivers Fuhse and Aller. It is surrounded with a mound and moat, but has suburbs on the outside; and the palace belonging to the royal family is surrounded by a separate wall and ditch. It has several charitable institutions, an orphan-house, a lunatic-hospital, a poor-house; also a school of surgery, and a society of agriculture. It is, however, best known by its court of appeal for the Hanoverian territory at large. Each province sends to this court two deputies, as assessors. The town is tolerably built, and has some trade; and the inhabitants, who are chiefly Lutherans, are in number about 8200. Zell was formerly the capital of a duchy belonging to a distinct branch of the house of Brunswick; on the extinction of this branch in 1705, their possessions devolved to the elector. The ducal palace was the residence of the unfortunate Caroline Matilda, queen of Denmark, from 1772 till her death in 1775; and a monument of Saxon marble is erected to her memory in the French garden; 21 miles north-north-east of Hanover, and 65 south of Hamburg.

ZELL, a town of Germany, in Bavarian Franconia; 3 miles north of Schweinfurt. Population 1000.

ZELU,

ZELL, a town of Germany, in Baden; 20 miles south of Freystadt. Population 1100.

ZELL AM HAMMERBACH, a town of Germany, in Baden; 22 miles south-east of Strasburg. Population 1100.

ZELL IM HAMM, a town of the Prussian province of the Lower Rhine, on the Moselle; 26 miles south-west of Coblenz.

ZELL IM PINZGAU, a town of Germany, in Upper Austria; 35 miles south-south-west of Salzburg.

ZELL IM ZILLERTHAL, a town of the Austrian states, in Tyrol, on the river Ziller; 24 miles east of Inspruck. Population 900.

ZELLA ST. BLAZIEN, a town of Germany, duchy of Saxe-Gotha; 18 miles south of Gotha. Population 1200.

ZELLANG, a town on the west coast of the island of Celebes. Lat. 4. 20. S. long. 120. 3 E.

ZELLENBERG, a small town of Alsace, surrounded by vineyards; 9 miles north of Colmar.

ZELLERFELD, or CELLERFELD, a town of Germany, in Hanover, in the Upper Hartz. It is separated from Clausthal only by the small river Zeller. It contains 3200 inhabitants, employed chiefly in the mines and smelting works of the Hartz. It is tolerably built, with broad streets, planted with lime-trees, and a large market-place. It has also a mint, with a collection of models of coins; 8 miles south-south-west of Goslar.

ZELLIN, a town of Prussia, in the New Mark of Brandenburg, on the Oder; 13 miles north-west of Custrin. Population 1300.

ZELLINGEN, a town of Germany, in Bavarian Franconia, on the Maine; 7 miles north-north-west of Wurzburg. Population 1700.

ZELLVIE, a small town of Russian Lithuania; in the government of Grodno; 25 miles north-west of Slonim.

ZELLWEILER, a village of France, in Alsace, with 1000 inhabitants.

ZELOTTI (Battista), was born at Verona in 1532. He was a pupil of Titian, according to Vasari, and a fellow-student with Paolo Veronese, with whom he co-operated in several important works at Venice. He particularly excelled in fresco, and that induced Paolo to court his assistance in many of the great works in which he was engaged. In consequence many of his works are given to Veronese, and those in the hall of the Council of Ten, in the palazzo S. Marco, have been engraved by Le Febre as the works of that master. His picture of the Holy Family, in the Carara collection, is painted with the strength and warmth of Titian, and others of his works in oil are deservedly esteemed and admired, particularly the Conversion of St. Paul, and Christ with his Disciples in the Fishing-boat, in the cathedral at Vicenza. He fell short of the grace and taste of Veronese, yet his invention was not lacking in energy; his touch is free and animated, and his compositions managed with skill and judgment. He died in 1592, aged 60.

ZEMANIAH, a town of Hindostan, province of Allahabad, district of Benares. It is situated on the south bank of the Ganges, a short distance above Ghazipore. It had formerly a good brick fort, built by Khan Zeman, the captain-general of Akbar, about the year 1570, three years after which it was attacked and taken by Daood Khan, the last king of Bengal. It is finely situated, but now not of any consequence; although its name is generally coupled with Ghazipore, by the natives.

ZEMINO, a town of Austrian Illyria, in Istria; 20 miles south-west of Fiume, with 2600 inhabitants.

ZEMPELBERG, a town of West Prussia; 30 miles north-west of Bromberg. It contains 2400 inhabitants, of whom a number are Jews. The chief trade of the place, in woollens, is carried on by them.

ZEMPLIN, a palatinate in the north-east of Hungary, bordering on Galicia, and lying between the palatinates of Saros and Ungvár. Its area is 2300 square miles; its population about 233,000. The country is mountainous, lying among the Carpathians and their ramifications; and contains the district (covered with the hills of moderate elevation,

called Hegy-Allya), which produce the far famed Tokay wine. This forms the most remarkable export of the county, though it is not deficient in other products, such as corn, tobacco, hemp, and fruit; nor in minerals. The Theiss forms part of its eastern boundary; and the Bodrogh, a smaller stream, intersects it. The chief town is Ujhely.

ZEMPLIN, a small town of Hungary, on the Bodrogh, which gives name to the preceding county, but is not the capital; 28 miles north-north-east of Tokay.

ZEMPOALA, a village of Mexico; 17 leagues north-east of Mexico.—It is the name of two other insignificant settlements in Mexico.

ZENATI, a river of Algiers, which soon changes its name to Seibouse.

ZENDAVESTA, by contraction *Zend*, and, as it is vulgarly pronounced, *Zundavestow* and *Zund*, denotes the book ascribed to Zoroaster, and containing his pretended revelations; and which the ancient Magians and modern Persees, called also Gaur, observe and reverence in the same manner as the Christians do the Bible, and the Mahometans the Koran, making it the sole rule of both their faith and manners.

The word, it is said, originally signifies any instrument for kindling fire, and is applied to this book to denote its aptitude for kindling the flame of religion in the hearts of those who read it.

The Zend contains a reformed system of Magianism; teaching that there is a Supreme Being, eternal, self-existent, and independent, who created both light and darkness, out of which he made all other things; that these are in a state of conflict, which will continue till the end of the world; that then there shall be a general resurrection and judgment; and that just retribution shall be rendered unto men according to their works; and that the angel of darkness with his followers shall be consigned to a state of everlasting darkness and punishment, and the angel of light with his disciples introduced into a state of everlasting light and happiness; after which light and darkness shall no more interfere with each other. The Zend also enjoins the constant maintenance of sacred fires and fire-temples for religious worship, the distinction of clean and unclean beasts, the payment of tithes to priests, which are to be of one family or tribe, a multitude of washings and purifications, resembling those of the Jewish law, and a variety of rules and exhortations for the exercise of benevolence and charity.

The above-mentioned doctrines of the Zend are accommodated to the eastern taste by a great intermixture of fable.

In this book there are many passages evidently taken out of the Scriptures of the Old Testament, particularly out of the Psalms of David: the author represents Adam and Eve as the first parents of all mankind, gives in substance the same account of the Creation and Deluge with Moses, differing indeed with regard to the former by converting the six days of the Mosaic account into six times, comprehending in the whole three hundred and sixty-five days; and speaks also of Abraham, Joseph, Moses, and Solomon. Moreover, this work contains doctrines, opinions, and facts, actually borrowed from the Jews, Christians, and Mahometans; whence, and from other circumstances, we may conclude, that both the history and writings of this prophet were probably invented in the later ages, when the fire-worshippers under the Mahometan government thought fit to vindicate their religion from the suspicion of idolatry.

In the "Memoirs of the Royal Society of Gottingen for 1799," i. e. "Commentationes Societatis Regiæ Scientiarum Gottingensis, &c." we have a memoir by M. Christopher Meiners, who enters into a critical examination of the authenticity and antiquity of the books published by M. Anquetil du Perron, as genuine writings of Zoroaster; and alleges many plausible arguments to prove them recent and spurious. He shews, that they contain a multitude of fables, totally unknown to the ancient Persians, and contrary to the spirit of their laws and religion; and also many opinions and ceremonies, which had their first rise many ages after Zoroaster. The dissertations of professor Meiners, relating to

the Zendavesta, are printed in the 8th volume of the *Novi Commentarii Soc. Reg. Gotting.*; and in the 1st and 3d volumes of the *Commentationes*.

Some have thought that the truths which are observable in the Zendavesta, Vendidad Sadi, and other writings of the eastern nations, were derived from the disciples of Nestorius, who were found very early on the coast of Malabar. But this, Mr. Bryant thinks, is a groundless surmise; because the religious sects among which these writings have been preserved, are widely separated, and most of them have no connection with Malabar or the Christians of that quarter. And besides, the Brahmins and Banians adhere closely to their own rites, and abhor all other persuasions; and they are influenced by customs and scruples which prevent their intercourse with other people. In their writings there occurs no trace of Christianity, or of its founder; and thence Mr. Bryant infers, that whatever truths may be found in the writings of these people, they were derived from a higher source, and by a different channel. *Anal. of Ancient Mythology.*

ZENDEROOD, a river of Persia, which rises in a mountain to the east of Ispahan, and passes through that capital, where three handsome bridges are built across it. It is afterwards employed and absorbed in irrigating the fields and gardens round the capital.

ZENEGUANCA, a bay of New Granada, on the coast of the province of Santa Martha.

ZENGG, or **SEGNA**, a town of Austrian Croatia, in the military district formerly called the Littorale, on the Adriatic. It stands at the foot of a steep mountain, and has a good harbour. It is a bishop's see, and contains 2800 inhabitants; 42 miles south-east of Fiume.

ZENGHI, a river of Armenia, which falls into the Aras; 10 miles south of Erivan.

ZENGUIA, a village of Syria, in the pachalic of Aleppo, on the Euphrates; 55 miles north-north-east of Aleppo.

ZENIEH, a village of Caramania, in Asiatic Turkey; 15 miles north of Selekeh.

ZENITARA, a river of New Granada, in the province of Antioquia, which enters the Rio de Magdalena.

ZENITH, *s.* [Arabic.] The point over head opposite to the nadir.

Fond men! if we believe that men do live
Under the *zenith* of both frozen poles,
Though none come thence, advertisement to give,
Why bear we not the like faith of our souls? *Davies.*

ZENIZO, a small island of New Granada, near the coast of the province of Carthagena, at the entrance of the river Magdalena.

ZENNAR, the name of a mystical thread worn by Brahmins, and by many individuals of other tribes of Hindoos. So prolix and minute are the authors of the Ordinances of the Hindoos, that rules for almost every occurrence of life, however trifling, have been laid down; not that any thing connected with the zennar has been deemed trifling by those who ordained it, by those who wear it, or those who revere it. On the contrary, the individuals to be so distinguished, the mode of manufacturing the sacred article, and its investiture, with many particulars, have occupied the attention of lawgivers, and are attended to with great respect by their obedient followers.

Brahmins affect to consider the zennar as of highly mysterious and sacred import, and do not consider an individual as fully a member of his tribe until he have assumed this holy emblem. A Brahmin should be invested with it at the age of eight years, by the hands of his father, who, with his Guru, or spiritual preceptor, twists that first put on. A Kshetriya receives it at eleven, from a Brahmin. A Vaisya at twelve years of age. A Sudra is on no account permitted to wear it. For a description of these four grand divisions comprising the whole race, see **HINDOO**.

ZENNOR, a parish of England, in Cornwall, adjoining the Land's End; 6 miles west-south-west of St. Ives. Population 671.

ZENO, called the *Eleatic*, in order to distinguish him from Zeno the Stoic, was a native of Elea, in Magna Græcia, and said to have been the adopted son of Parmenides, whose disciple he was, flourished about the year 463, B. C. and chose to live in his native city rather than at Athens, for the sake of maintaining his independence. He is represented as a zealous friend of civil liberty, and as having lost his life in his opposition to a tyrant. It is said, that having been detected in a conspiracy against the petty tyrant of the place of his nativity, he endured the most cruel torments, because he would not betray his accomplices; and that at length his countrymen, roused by his fortitude, fell upon the usurper and stoned him to death. To him the invention of the dialectical art has been erroneously ascribed.

According to Aristotle, Zeno taught that nothing can be produced either from that which is similar or dissimilar; that there is only one being, and that is God; that this being is eternal, homogeneous, and spherical, neither finite nor infinite, neither quiescent nor moveable; that there are many worlds; that there is in nature no vacuum; that all bodies are composed of four elements, heat and moisture, cold and dryness; and that the body of man is from the earth, and his soul an equal mixture of these four elements. He argued with great subtlety against the possibility of motion. If Seneca's account of this philosopher deserves credit, he reached the highest point of scepticism, and denied the real existence of external objects.

Bayle depreciates the practical philosophy of Zeno, on account of his vindication of the warmth with which he resented reproach, by saying, "If I were indifferent to censure I should also be indifferent to praise." His works, though unknown to the moderns, were held in high estimation among the ancients. *Diog. Laert. Bayle. Brucker, by Enfield.*

ZENO, the founder of the *Stoic* sect, was born about the year 366, before Christ, and died, as it is said, in the 1st year of the 129th Olympiad, or 264 B. C. For an account of him, see the article **STOICS**.

ZENO, Roman emperor of the East, was a descendant of an Isaurian family of distinction, and at first bore the name of "Trascalissæus." Being a commander of the Isaurian troops in the service of Leo I., he married Ariadne, a daughter of the emperor, who created him a patrician, and raised him to the chief command of all the armies in the East. See **ROME**.

ZENOBIA (*Queen*), was a native of Syria, in the third century, who claimed descent from the Macedonian kings of Egypt. See **ROME**.

ZENTHA, or **SZENTHA**, a small town of Hungary, on the Theiss; 60 miles north of Belgrade, and 52 west of Temesvar.

ZENTLA, a settlement of Mexico, in the province of Valladolid, containing 105 Indian families.

ZENTLALPAN, a settlement of Mexico, near the city of Mexico, containing 273 Indian families.

ZENTORA, a small river of Quito, in the province of Mainas, which runs east, and enters the Napo.

ZEOLITE. See **MINERALOGY**.

ZEPEDA, a settlement of New Granada, in the province of Santa Martha.

ZE'PHYR, or **ZE'PHYRUS**, *s.* [*zephyrus*, Lat.] The west wind; and poetically any calm soft wind.

They are as gentle
As *zephyrs* blowing below the violet. *Shakspeare.*

Mild as when *Zephyrus* on Flora breathes. *Milton.*

ZEPITA, a settlement of New Granada, in the province of Pamplona.—There is another settlement of this name in Peru.

ZEPTAU, or **ZOPTAU**, a small town of the Austrian states, in Moravia, circle of Olmutz. Here are several iron works.

ZERBST, or **ANHALT-ZERBST**, a small principality of the interior of Germany, of which the town of Zerbst was the capital until 1793, when the branch of the house of Anhalt in possession of that district, becoming extinct, the territory

was divided into three portions, and shared among the three remaining branches of that house.

ZERBST, a town in the interior of Germany, in the duchy of Anhalt-Dessau. It stands on the small river Nuthe; is surrounded with a mound; has a population of nearly 8000; and is the best town in the states of the house of Anhalt. The palace, where the prince resided, when this was the capital of Anhalt-Zerbst, and where Catherine II. of Russia was born, is a large and stately building, outside of the walls. Brewing, as in other German towns, forms a main branch of industry; woollens are made in small quantities; and the ornamental manufactures (jewellery and silver-smith's work), have decreased since the removal of the court. Here are a gymnasium and a free school; 65 miles west-south-west of Berlin.

ZERETE, a settlement of New Granada, in the province of Carthagena.

ZEREZUELA, a settlement of New Granada, in the province of Bogota; 9 miles south-east of Sante Fe.

ZERKOU, a town of Prussian Poland; 36 miles south-east of Posen. Population 800.

ZERMAGNA, a river of Dalmatia, near the borders of Croatia. There is a small town of the same name near its mouth.

ZERNOWITZ, or **ZARNOTZ**, a small town of Hungary, on the river Gran; 8 miles west of Schemnitz. Population 4000.

ZERUMA, a village of New Granada, in the province of Guayaquil, celebrated for having some rich gold veins in its neighbourhood, which have failed, owing to the want of proper exertion being made to clear them. This town or village was one of the first which was built in the province, and contains 5000 or 6000 inhabitants.

ZEST, *s.* The peel of an orange squeezed into wine.—A relish; a taste added.

Almighty Vanity! to thee they owe
Their zest of pleasure, and their balm of woe. *Young.*

To **ZEST**, *v. a.* To heighten by an additional relish.

ZETEGANTI, a small river of South America, in the province of Darien, which runs north, until it falls into the gulf of San Miguel.

ZETE'TICK, *adj.* [from *ἕτης*.] Proceeding by enquiry.

ZETIN, a small town of Croatia, and the chief place of a small district, ceded to Austria by Turkey, in 1791; 30 miles west-by-north of Novi.

ZEVACO, or **ZESACA**, a small island in the Pacific ocean, near the coast of Veragua. Lat. 8. N. long. 81. 46. W.

ZEVENHUIZEN, a village of the Netherlands, in the province of Utrecht, with 1400 inhabitants; 5 miles north of Amersfort.

ZEU'GMA, *s.* [from *ζευγμα*.] A figure in Grammar, when a verb agreeing with divers nouns, or an adjective with divers substantives, is referred to one expressly, and to the other by supplement; as lust overcame shame, boldness fear, and madness reason.

ZEULEN, a town of Germany, in Bavarian Franconia, on the Rodach; 19 miles north-north-east of Bamberg. Population 800.

ZEULENRODE, a town of the interior of Germany, and principality of Reuss; 11 miles west of Greitz. Population 3600.

ZEUS, a genus of fish, of the order of the thoracici; the characters of which are, that the head is compressed and declining; the upper lip is arched by means of a transverse membrane; the tongue is awl-shaped; the branchiostegous membrane has seven perpendicular rays, the lowest placed transversely; the dorsal fins, in most species, furnished with projecting filiform rays; and the body is compressed, broad, thin, and of a bright colour. The species enumerated by *Mélin* and *Shaw* are the following:

1. **Zeus vomer**.—Silvery dory, with the second ray of the dorsal fin very long; *Bloch.* (See *VOMER*.) Its shape is rhomboidal, length six or eight, or more, inches, body thin, without scales, tinged on the upper parts with a blueish cast,

mouth with small teeth.—Native of the American seas, and sometimes seen in those of the north of Europe: eatable, but not much esteemed.

2. **Zeus gallus**.—Silvery dory, with the tenth ray of the dorsal and second of the anal fin longer than the body. Shape and length, and body, like those of the former; back tinged with a greenish hue, head large, mouth wide.—Native of the American and Indian seas, esculent; when first taken grunting, like the gurnards. The abacatuaja of *Marcgrave*.

3. **Zeus faber**.—Gold-green, fuliginous dory, with a dusky central spot on each side of the body, or with a rounded tail, brown spot on the middle of the sides and two anal fins. *Linnaeus*. This is the common dory (see *DOREE*), which is a native of the Mediterranean, Northern, and Atlantic seas. Its head is large and long; length generally twelve or fifteen inches, and weight ten or twelve pounds; mouth wide, lower jaw longer than the upper, teeth small and sharp, eyes large, body covered with small scales, and marked by a curved lateral line, which descending pretty suddenly from the gill-covers, passes on to the tail; back arched, and furnished with a row of strong, small prickles, continued along the curve of the abdomen; two very strong and sharp spines at the base of the pectoral fins. The introduction of this fish, as excellent food, to the tables of the higher ranks, is of no remote date; Mr. *Quin* being considered as the founder of its peculiar reputation in the polite circles. This fish is of a very voracious nature, preying on smaller fishes and their spawn, as well as various kinds of sea-insects, the smaller shell-fish, &c. It emits a noise like that of the gurnards and scorpanas, when first taken, by violently forcing out the air from its gill-covers.

4. **Zeus aper**.—Reddish dory, with rough scales and even tail; a small species about three inches long, resembling the common dory in habit; snout protuberant, and turning upwards; no perceptible teeth; eyes large, with white irides; two dorsal fins, the anterior having nine strong and sharp spines, the first low and scarcely visible, the second four times longer, and the third very long and thick; the second dorsal fin consisting of twenty-three soft rays; the vent fin having twenty-six rays, the pectoral fins about fourteen, and the ventral six. This fish generally resides at the bottom, and is accidentally taken after great storms: it is not eatable, being small, coarse, and of an unpleasant odour.—It is a native of the Mediterranean.

5. **Zeus insidiator**.—Silvery dory, with sides speckled with black, and narrow extensile mouth; shape rhomboidal; smaller than *zeus ciliaris*; colour bright-silvery, blueish-green above, and speckled with black points; body without scales; lower lip retractile, and mouth capable of forming a tubular snout, for ejaculating a drop of water against such insects as happen to alight on or fly about the aquatic plants near the shores of the waters it inhabits, and thus obtain its prey.—A native of the rivers and fresh-waters of India.

6. **Zeus ciliaris**.—Silvery dory, with some of the rays in the dorsal and anal fin excessively long; body rhomboidal, thin, without scales, and of a bright silver colour, with a blueish or greenish cast on the back, and small and sloping; lower jaw longer than the upper; teeth small and sharp; several of the last rays of the dorsal and anal fin extending farther than the tail itself, the long and flexible filaments of which *count de Cépède* imagines attract small fishes, which mistake them for worms, the dory himself lying concealed among sea-weeds, &c., and waiting for its prey; the count also conceives that these may serve to sustain the fish by coiling round the stems of sea-plants, &c.—A native of the Indian seas, but not esteemed as food, being small and coarse.

7. **Zeus luna** or *opah*.—Dory with somewhat lunated tail; the body being generally either red, green, or purple, with oval white spots. This is a superb species, and found, probably wandering from the warmer regions, in the Mediterranean and northern seas, the largest species of the kind, being between four and five feet in length, in colour varying from a bright silvery-green ground to a bright gold colour, and

and variegated on the sides with pretty numerous and moderately large oval white spots, while the fins and tail are bright scarlet; the skin seemingly destitute of scales and perfectly smooth.

Specimens of this fish have been occasionally thrown on the British coasts, one of which is described under the article *OPAH*. A dried specimen of this fish may be seen in the British Museum.

7. *Zeus quadratus*.—Grey dory, with transverse dusky or a cinereous body, and even tail. This fish, found in the sea that washes the coast of Jamaica, is described by sir Hans Sloane, as five inches long and four broad in the middle, narrowing from thence gradually to the head and tail; mouth small, but with rows of small, sharp teeth; tongue round and cartilaginous; pupil large and black, in a white circle; seven fins; tail almost square; whole body clothed with grey or ash-coloured scales, having three or four transverse black lines; with a very crooked line from head to tail.

ZEUTZHEINN, a small town of Germany, duchy of Nassau, near Hadamar, on the Dietz.

ZEUXIS, a celebrated ancient painter, who is said to have been a native of Heraclea, either in Greece or Magna Græcia, and to have commenced the practice of his art in the fourth year of the 95th Olympiad, B. C. 397. According to Quintilian, he is the first artist who understood the proper management of lights and shades, and to have excelled in colouring; but ambitious of imitating the strength and grandeur of Homer's manner, he is charged with giving unsuitable bulk to the heads and massiveness to the limbs of his figures. Notwithstanding these alleged imperfections, he attained distinguished excellence; and in the prosecution of it he was attentive even to the minutest circumstance. Many instances occur in his history to this purpose. In his picture of Helen, executed for the Crotonians, as an ornament for their temple of Juno, he determined to combine every quality that might constitute a perfect beauty; and with this view he selected five of the handsomest females of Crotona, and transferred to his picture, from their naked charms, an assemblage of all that were most perfect in their kind. This figure has been extolled as the finest specimen of art existing; and under it the painter, not unconscious of his merit, inscribed the lines of Homer, in which Priam expresses his admiration of the beauty of the real Helen. Every one who saw it, before it was placed in the temple, paid the painter a fee, which, added to the liberal recompence of the Crotonians, amply repaid him for his skill and labour. This enabled him to gratify his vanity by making presents of his pictures, for which no adequate price could be given. To such a degree was he enriched by his art, that he was able to indulge his vanity by appearing at the Olympic games with his name embroidered in golden letters upon his mantle. Such were the failings of a man, who rendered his name illustrious by the supereminent exercise of his art. Among his most famous performances are enumerated—a Jupiter on his throne, with the other gods standing round;—a Hercules in his cradle, strangling the serpents, Alcmena and Amphitryon witnessing the exploit with terror;—a Penelope, with an expression conformable to her character;—a Cupid crowned with roses, for the temple of Venus at Athens;—a Marsyas bound, afterwards placed in the temple of Concord at Rome;—and a group of Centaurs. The time of his death is not known; but as to the manner of it, the following whimsical anecdote is recorded: after having painted an old woman, whilst he was attentively surveying it, he was seized with such a violent fit of laughter, that he died on the spot. *Pliny Hist. Nat. Gen. Biog.*

ZEYA, a small river of Germany, in Lower Austria, which falls into the March; 8 miles east of Zistersdorf.

ZEYL, a town of Germany, in Bavarian Franconia, on the Maine; 17 miles west-by-north of Bamberg. Population 1100.

ZEYRING, UPPER, a small town of the Austrian states, in Styria; 6 miles north-west of Judenburg. Population 1000.

ZEYST, a village of the Netherlands, in the province of

Utrecht, with a castle, and 1300 inhabitants; 11 miles north-east of Utrecht.

ZEZERE, a considerable river in the central part of Portugal, which falls into the Tagus, near Tancos, to the west of Abrantes.

ZEHOL, or *GEHOL*, a large village of Chinese Tartary, forming the hunting residence of the emperor of China during the summer months. The surrounding mountains are very high, some of them rising to the height of 15,000 feet. It consists merely of palaces of the grandes, mixed with a few miserable Tartar huts. The imperial gardens here possess uncommon splendour and beauty, being varied with magnificent woods, lawns, rocks, and hills, through which winds an extensive lake; 100 miles north of Pekin.

ZIA, or *ZEA*, the ancient *Ceos*, an island of the Greek archipelago, in the group of the Cyclades, situated to the south-west of Negroponte, and about 10 miles from Cape Colonna (Sunium), the southern point of Attica. Its length is fifteen miles; its breadth eight. Its soil is fertile, and tolerably cultivated. Its products are vines, mulberries, figs, cotton, and corn. The inhabitants, almost all Greeks, are in number about 6000. They are in general industrious, and appear to have retained several of the customs and good qualities of their ancestors. In ancient times, the island contained four towns; at present it has only that of Zia, which, being situated on the ascent of a mountain, the top of which is covered with wind-mills, presents a striking appearance from the sea. It is the see of a Greek bishop; has a large harbour; and is situated in Lat. 37. 30. N. long. 24. 24. E.

ZIBIRJOA, a settlement of Mexico, in the province of Cinaloa.

ZICALPA, a settlement of Quito, in the province of Riobamba.

ZICAPUZALCO, a settlement of Mexico, in the intendancy of Mexico.

ZICAVO, a town of the island of Corsica, not far from the Taravo. Population 1200.

ZICUICHI, a settlement of Mexico, in the province of Valladolid.

ZIEGELHAUSEN, a village of the west of Germany, in Baden; 5 miles east-north-east of Heidelberg. Population 900.

ZIEGELHAYN, a large village of Germany, in Saxony, and the county of Schonburg.

ZIEGENHALS, a town of Prussian Silesia, on the borders of Austrian Silesia, and 11 miles south of Neisse. Population 2000.

ZIEGENHAYN, formerly a county in the west of Germany, now a province of the electorate of Hesse, lies between Lower Hesse, Upper Hesse, and the province of Hersfeld. Its area is 220 square miles; its population 28,000, chiefly Calvinists. It is watered by the Schwalm; has extensive forests; also some good tillage and pasture land.

ZIEGENHAYN, a town of Germany, in Hesse-Cassel and the chief town of the county of the same name. It stands on the Schwalm, in the midst of marshes; contains 1100 inhabitants, is a place of some strength, and has a castle; 29 miles south-by-west of Cassel.

ZIEHL, or *THIELLE*, a navigable river in the west of Switzerland, which rises in the Pays de Vaud, flows through the lakes of Neufchatel and Bienné, and joins the Aar.

ZIELENZIEG, an inland town of Prussia, in the New Mark of Brandenburg, on a small river. It has 3100 inhabitants, and considerable woollen and linen manufactures; 22 miles east-north-east of Frankfort on the Oder.

ZIEMETSHAUSEN, a town of Bavarian Franconia, in the county of Oettingen-Wallerstein, on the Zusam. Population 1500.

ZIENABAD, one of the names of the city of Boorhanpore.

ZIERENBERG, a fortified town of Germany, near the river Warme; 9 miles west-north-west of Cassel. Population 1000.

ZIERIA [so named by Dr. Smith, in memory of John Zier, fellow of the Linnean Society, an indefatigable botanist], in Botany, a genus of the class tetrandria, order monogynia, natural

natural order of rutaceæ (*Juss.*)—*Essential Character.* Calyx four-parted. Petals four. Stamina smooth, placed on glands. Styles simple. Stigma four-lobed. Capsules four, united. Seeds arilled. This is one of the twenty new genera from the South Seas, the characters of which are given by Dr. J. E. Smith. It is distinguished by having each of the stamens inserted into a large gland; and consists of shrubs with opposite ternate leaves, and white flowers.

ZIERIK-SEE, a town of the Netherlands, in the province of Zealand, situated on the island of Schouwen, not far from the Eastern Scheldt, with which it communicates by what is called the New Harbour. It has a population of 6300, but few public buildings worthy of notice, except the town-hall and the principal church. It is said to have been formerly of greater consequence; but in the changes that occur in a country exposed to inundation, its harbour was almost blocked up with sand. It still, however, has 50 vessels belonging to its port; also fisheries, and extensive oyster banks. It has a traffic also in salt and in madder, a principal product of the island; 30 miles south-west of Rotterdam. Lat. 51. 39. 4. N. long. 3. 54. 59. E.

ZIESAR, a small town of Spain, in Murcia, on the river Segura.

ZIESAR, a town of Prussian Saxony; 18 miles south-west of Magdeburg. Population 1900.

ZIG-ZAG, *s.* A line with sharp and quick turns. *Mason.*

Like running lead,

That slipt through cracks and *zig-zags* of the head. *Pope.*

A winding road, which forms thirteen *zig-zags*. *Twiss.*

ZIG-ZAG, *adj.* Having sharp and quick turns.—He seems to have been contemplating some *zig-zag* shrubberies. *Graves.*

To ZIG-ZAG, *v. a.* To form into sharp and quick turns.—The middle aisle has on each side four Norman round arches *zig-zagged*, surmounted with as many round-headed small windows. *Warton.*

ZILAH, or ZILLENMARKT, a market town of Transylvania, in the palatinate of Solnoch. Lat. 47. 9. 30. N. long. 23. 2. 11. E.

ZILLEBA, a village of Yemen, in Arabia; 35 miles east of Loheia.

ZILTAN, a very high mountain of Northern Africa, to be passed in the way from Mourzouk to Augila.

ZIMACOTA, a settlement of New Granada, in the province of Tunja, which contains 1000 inhabitants.

ZIMAPAN, a town of Mexico, in the intendency of Mexico, containing 820 Indian families, and 200 of Spaniards, mestizoes, and mulattoes; 58 miles north-north-east of Mexico. Lat. 20. 45. N. long. 98. 40. W.

ZIMARA, a village of Asiatic Turkey, in the government of Sivas; 55 miles east of Sivas.

ZIMATLAN, a settlement of Mexico, in the intendency of Oaxaca, containing 600 Indian families; 11 miles south-west of Oaxaca.

ZIMBAO, a city of Mocaranga, in the interior of Eastern Africa, capital and residence of the Quiteve or sovereign of Monomotapa. It is situated fifteen days journey to the west of Sofala, and forty days journey south from the Portuguese settlement of Sena, on the Zambese.

ZIMI, a large river of New Granada, in the province of Carthagera, which runs north, and enters the Pacific ocean, in lat. 9. 28. N. The territory washed by this river is very fertile, and provides with fruit and herbs the city of Carthagera.

ZIMI, a town of the above province and kingdom, on the east shore of the former river. It was a large town in the time of the Indians; and in it much gold was found by Pedro de Heredia, in 1534. It is now reduced to a miserable village.

ZIMITARA, a river of New Granada, in the province of Carthagera, which runs north-north-east, and enters the Magdalena.

ZIMITI, a town of South America, in the province of Carthagera, near a lake; 60 miles south of Santa Fe de

Bogota, and 190 south-south-east of Carthagera. Lat. 7. 42. N. long. 74. 6. W.

ZIMMERMAN (John George), an eminent physician and miscellaneous writer, was born in 1728 at Brug, in the canton of Bern. Having completed his preparatory education at Bern, and chosen the medical profession, he placed himself in the university of Gottingen, under the tuition of the celebrated Haller; and on graduating in 1751, the subject of his thesis was the doctrine of irritability. His respect for Haller was testified in the account he gave of him in the journal of Neufchatel, printed in 1752. Having married at Bern a relation of Haller, he settled as a physician in his native town. The retirement of his situation afforded him an opportunity of composing many pieces in prose and verse; and in 1756 he published the first sketch of his popular work "On Solitude." This publication was followed by an essay "On National Pride," in 1758; by his work "On the Experience of Medicine," in 1763, and several others; and by "A Treatise on Dysentery," in 1766. In 1768 he accepted an invitation to occupy the vacant post of physician to the king of England for Hanover, whither he removed. In this situation, the accumulation of business furnished in some measure an antidote to that constitutional irritability of temper, and tendency to hypochondriacal complaints, which in the retirement of a small town had rendered him unhappy; and having occasion to place himself under the medical care of a surgeon at Berlin, on account of a local disease under which he laboured, his removal thither in 1771, and the notice that was taken of him by several persons of distinction, and even by the king, were favourable both to his health and spirits, and of course to his happiness. Having lost his first wife, he formed a second matrimonial connection in 1782; and to this union he was indebted for many of those comforts which counterbalanced and alleviated his afflictions. His remaining years were chiefly devoted to the completion of his work "On Solitude," which was published in four volumes. In the year 1786, Zimmerman was sent for to attend the great Frederick in his last illness; and this visit gave him an opportunity of publishing an account of his "Conversations" with that celebrated prince. He was induced also, by the notice that was taken of him, to undertake a defence of the character of Frederick against the censures of count de Mirabeau. The severe criticisms to which these writings exposed him, and the part he took in the controversies that agitated the continent with regard to the principles that produced the French revolution, irritated his feelings and disquieted a mind like his peculiarly susceptible of contumely and reproach. His political and religious principles led him to view with jealousy and detestation those societies which, in his judgment, and in that of others of similar sentiments, aimed at the subversion of established forms and authorities, and to declare war against them. Such were his abhorrence and dread of them that he addressed a memoir to the emperor Leopold, recommending the suppression of them by force; and he subjected himself to a prosecution for a libel by a charge brought against a person by name for an unavowed publication. His mind had arrived to such a state of irritation, that the approach of the French towards Hanover in 1794 almost subverted his reason. Dreading the consequences of their arrival, he abstained from food, wasted to a skeleton, and died absolutely worn out in 1795, at the age of 66. "Such," says his biographer, "was the melancholy end of a man whose moral and intellectual qualities rendered him in a high degree the object of private friendship and public esteem."—*Tissot's Life of Zimmerman. Gen. Biog.*

ZINAPEQUARO, a settlement of Mexico, in the intendency of Valladolid, containing 245 Indian families.

ZINC, *s.* A semi-metal of a brilliant white colour approaching to blue. *Mason.*—Zinc has been found native, though rarely, in the form of the thin and flexible filaments, of a grey colour, which were easily inflamed, when applied to a fire. *Cronstadt.*

ZINDINSKAIKA, a fortress of Asiatic Russia, in the government of Irkoutsk; 80 miles south of Selenginsk.

ZINDORF, a large village of the Prussian states, in the duchy of Berg. It is situated on the Rhine, near Siegburg.

ZINGA, a settlement of Peru, in the province of Huamalies.

ZINGILLA, a strong mountain fortress of Abyssinia, in the province of Samen.

ZINGIS, otherwise **JENGHIZ-KHAN**, or *Genghiz-khan*, the founder of the Mogul empire, was the son of Bisukai, or Jesukai, a chief over thirteen hordes of Moguls in the Tartarian range between China and the Caspian sea, and born about the year 1161 or 1163, his first name being Temujin. See **MOGUL**.

ZINGST, a small island on the coast of Pomerania. It is separated from the Baltic by a small strait called the Barthische Binnenwasser, and contains a few villages. Lat. 54. 28. N. long. 12. 50. E.

ZINJAN, a considerable and prosperous town in the northern part of Irak, in Persia, capital of a district; 21 miles north-west of Sultania.

ZINKENDORF, **GREAT** and **LITTLE**, two villages of the west of Hungary, in the palatinate of Oedenburg.

ZINKOV, a small town of European Russia, in the government of Pultava, and the chief place of a circle; 46 miles north of Pultava.

ZINKOW, another small town of Russia, in the government of Podolia; 32 miles north of Kaminiac.

ZINN (John Godfrey), an anatomist and botanist, was born in 1726, studied under Haller at Gottingen, and became botanical professor in that university. His first experiments were undertaken in order to ascertain the sensibility of different parts of the brain; he then proceeded to the examination of the eye, which produced his esteemed work, intitled "Descriptio Anatomica Oculi Humani, Iconibus illustrata," Gotting. 4to. 1755. Botany was also the subject of his assiduous study, the result of which appeared in several papers, and in a Catalogue of the Plants in the Academical Garden and Vicinity of Gottingen, arranged according to the system of Haller. His premature death happened at the age of 32, in April, 1758. He was a member of the Academy of Sciences at Gottingen, the Institute of Bologna, and the Royal Society of Berlin.—*Haller. Eloy.*

ZINNA, a town of the Prussian states, in the province of Brandenburg, with 1000 inhabitants. In the neighbourhood is a village of the same name; 35 miles south-by-west of Berlin.

ZINNIA [so named by Linnæus, in honour of John Godofr. Zinn, pupil of Haller, and professor of botany at Goettingen after him], in Botany, a genus of the class syngenesia, order polygamia superflua, natural order of compositæ oppositifoliæ, corymbiferæ (*Juss.*)—Generic Character. Calyx common ovate-cylindrical, even, imbricate; scales numerous, obtuse, erect, permanent. Corolla compound, radiate; corollets hermaphrodite, several in a raised disk. Females five to ten, in a ray. Proper of the hermaphrodite funnel-form, five-cleft, villose within. Female ligulate, roundish, retuse, larger than the disk, permanent. Stamina in the hermaphrodites: filaments five, very short. Anther cylindrical tubular. Pistil in the hermaphrodites: germ oblong, awned, one awn longer than the other. Style filiform, semibifid. Stigmas two, erect, obtuse. In the females: germ oblong, three-sided, awnless. Style capillary, semibifid. Stigmas two, recurved. Pericarp none. Calyx unchanged. Seeds in the hermaphrodite solitary, oblong, four-cornered-ancipital. Down with two points, one of them awned. In the females solitary, awnless, crowned with the permanent petal. Receptacle chaffy: chaffs tongue-shaped, channelled, length of the calyx, deciduous.—*Essential Character.* Calyx ovate-cylindrical, imbricate. Florets of the ray five, permanent, entire. Seed-down with two erect awns. Receptacle chaffy.

1. *Zinnia pauciflora*, or yellow zinnia.—Flowers sessile; leaves opposite, cordate-lanceolate, embracing, sessile. This rises to the height of four feet. The stalks become hard and woody, and divide into many branches.—Native of Peru.

2. *Zinnia multiflora*, or red zinnia.—Flowers peduncled;

leaves opposite, ovate-lanceolate, sub-petioled. Root annual. Stalk and branches more erect, covered with soft hairs and channelled.—Native of North America.

3. *Zinnia verticillata*, or whorl-leaved zinnia. Flowers peduncled; leaves in whorls ovate-lanceolate, petioled; ray double. This resembles the first species; but the leaves are always in whorls, three, four, or five together; and the ray of the corolla is red and double.—Native of Mexico.

4. *Zinnia elegans*, or purple zinnia.—Flowers peduncled; leaves opposite, cordate-ovate, sessile embracing; stem rough-haired; chaffs of the corolla serrate. Root annual. Stem erect, round, rough, six feet high, putting forth upright branches the whole length.—Native of Mexico.

5. *Zinnia tenuiflora*, or slender-flowered zinnia.—Flowers peduncled; leaves opposite, cordate-lanceolate, petioled; ray linear-lanceolate, reflexed. Root annual. Stem three feet high, erect, round, rugged, hirsute, branched, the thickness of a reed.—Native of South America.

Propagation and Culture.—Sow the seeds upon a moderate hot-bed in March. When the plants come up, raise the lights to give them air, whenever the weather is not too cold, otherwise the plants will draw up weak. When they are about an inch high, plant them on another hot-bed, but do not treat them too tenderly, for they are very subject to grow too luxuriant in branches.

ZINNWALD, a mining town of Germany; 4 miles south-south-west of Lowenstein. Population only 900.

ZINTEN, a town of East Prussia, on the small river Strage; 18 miles south-south-west of Königsberg. Population 1500.

ZINTO, a river of New Granada, in the province of Santa Martha, which runs from south to north, and enters the sea, forming a small bay. Its mouth is in lat. 11. 17. N.

ZINU, a seaport of South America, in the gulf of Darien, noted for the fertility of the surrounding country.

ZINZELEJO, a settlement of New Granada, in the province of Carthagena.

ZINZENDORF (Nicholas Louis), was born at Dresden in May, 1700. Under professor Franke at Halle, he became a good classical scholar; and his facility in composing verses was such, that he indited them faster than he could write them. Such, however, was his proneness to dissipation, and particularly gaming, that he squandered away not only his money, but all his effects. From his youth he was fond of forming religious societies, and it is said that he had established seven associations of this kind between the year 1710 and the year 1716, when he left Halle. About the year 1722 he indulged the notion of a purer church discipline, of which he observed some traces among the Bohemian and Moravian brethren, who, from their earliest connection with the Waldenses and true followers of John Huss, had formed a peculiar religious community. The Christians of this description had undergone from the year 1458 to 1627, severe persecutions, so that they were almost extirpated from Germany; but a small number of them remained, under oppression, in Moravia; and about the year 1720 the sect revived: so that they held frequent meetings, read the Scriptures with their old books of hymns, celebrated in secret the holy sacrament, and introduced, at least in their houses, the ancient church discipline. One of their number, of obscure condition, obtained an introduction to count Zinzendorf, who gave them leave to settle on his estate at Bertholdsdorf. Availing themselves of this permission, a small number of them, consisting of three men, two women, and five children, came hither from Moravia, in Whitsuntide, 1722, and erected on a hill, in a wild marshy district, a wooden habitation, exposing themselves to the derision of the adjacent inhabitants. They were so poor that the countess sent them a cow to supply milk for their children. However, they gradually gained new converts; and when the count and his consort visited this new settlement of the Moravian brethren in the month of December, he gave them a cordial welcome, and falling upon his knees, pronounced a benediction on the infant colony. Such was the origin of the village of Hernhut. The count, whilst he afforded them protection,

left them at full liberty to think for themselves; more especially as he found, upon examination, nothing improper in their doctrine. From this time, count Zinzendorf, in connection with some other persons similarly disposed, took pains in giving instruction to his subjects; and educating their children; avowing himself a true Lutheran, but wishing that his people might remain totally ignorant of the disputes that subsisted among Protestant divines.

In 1760 he died at Hernhut, after an illness of four days, and his funeral was attended by 2000 of his followers, and as many spectators; and his coffin was carried to the grave by thirty-two preachers and missionaries, some of whom had come from Holland, England, Ireland, North America, and even Greenland.

ZINZIG, a petty town of the Prussian states, near the Rhine; 20 miles west-north-west of Coblenz. Population 800.

ZIOPATA, a bay on the coast of New Granada, and province of Carthagena, in the gulf of Tolu.

ZIORICA, an island of the river Orinoco, opposite La Guyana.

ZIPACON, a settlement of New Granada, in the province of Bogota.

ZIPAQUIRA, a settlement of South America, in New Granada, containing 800 housekeepers; 10 miles north-north-east of Santa Fe.

ZIPLINGEN, a village of Germany, in Wirtemberg. Population 1000.

ZIPS, a palatinate in the north of Hungary, bordering on Poland, and situated between the palatinates of Saros and Liptau. Its area is about 1800 square miles; its population 165,000. It is a mountainous district, situated among the Carpathians, and containing the Lomnitz, the loftiest peak of the whole chain. Its wealth lies in its mines of iron and copper, and in its manufactures of hardware and linen.

ZIPUAZA, or **ZIPEZA**, in the time of the Indians, a large and populous city of New Granada, in the province of Santa Martha. It is at present a miserable village, situate on the south-west coast of Lake Zapotosa, and at a small distance from the grand river Magdalena on the east part, and about 56 miles south-south-east of the city of Teneriffe.

ZIRCON. See **MINERALOGY**.

ZIRITA, a river of the Caraccas, which runs into Lake Maracaibo. There is a town of the same name on its banks.

ZIRKE, or **SIERAKOW**, a town of Prussian Poland, on the Wartha; 38 miles west-north-west of Posen. Population 1800.

ZIRKNITZ, or **CZIRKNIZ**, a remarkable lake of the Austrian states, in Carniola; 23 miles south-south-west of Laybach. It is situated amidst lofty mountains and frightful precipices, composed of calcareous matter, and containing vast subterranean caverns, which communicate with each other by openings, which are in general small. The lake of Zirknitz, which is six miles in length, and three in breadth, presents a curious phenomenon, having two subterranean outlets, by which its water is wholly discharged. The bottom of the lake remaining dry for about four months, is cultivated, and made to produce a crop of millet and hay. At the end of this period, the water rises with impetuosity through several openings, and fills the lake to its former height, in the short space of twenty-four hours.

ZIRL, a populous village of the Austrian states, in Tyrol; 7 miles west of Inspruck.

ZIRLAW, a village of Prussian Silesia, in the circle of Schweidnitz. Population 900.

ZIS, a river of Africa, rising from a mountain of the same name, forming part of the Atlas, between Fez and Tafilet. It flows southwards, and loses itself in the sands of Tafilet.

ZISKA (John), a distinguished leader among the Hussites, was the son of a Bohemian gentleman, named "De Trocznou," and celebrated for military valour in his youth. Ziska, denoting "one-eyed," was an appellation, which he bore in consequence of having lost an eye in a combat, on occasion of the perfidious execution of John Huss and Jerome of

Prague, at the council of Constance. Their followers took up arms, and invited Ziska to be their commander. In 1519 he accepted the invitation; and having assembled a body of peasants, he soon disciplined them so as to be equal to veteran troops. From a fortress which he constructed on an elevated situation, and called Thabor, the Hussites derived the name of Thaborites. At the siege of Rabi he lost his other eye; but though totally blind, he executed his office as commander with great vigour and success. At Aussig on the Elbe he gained a complete victory over the Catholics, and left 9000 of them on the field, retaliating the severities which they inflicted on the Reformers, by demolishing their churches, committing their priests to the flames, massacring those who were prisoners, and laying waste their country, and thus rendering his name formidable. Having made himself master of the new town of Prague, it was invested by the emperor Sigismund and other princes: but Sigismund, being defeated with great slaughter by the Thaborites, was obliged to retreat into Moravia, while Ziska laid siege to Wisrhade. When the emperor with a fresh accession of forces renewed the attack, he lost his whole army, and the town surrendered to Ziska. He also dispersed an army of crusaders commanded by an archbishop; and in 1422 he again routed the army of Sigismund. In the mean time the Hussites renounced their allegiance to Sigismund, and chose for themselves a king; but this measure was disapproved by Ziska and the Thaborites, because they were inclined to a republican government; and the new king was compelled to abdicate his crown. Such were the reputation and importance which Ziska acquired, that Sigismund proposed to him terms of accommodation; but in his journey to hold a conference with the emperor, he was seized with the plague, which terminated his life in 1524. Although the story of his having ordered his flesh to be given to the birds and beasts, and his skin to cover a drum, for the purpose of sounding dismay to his enemies and courage to his friends, be fabulous, it is certain that the Bohemians regarded his memory with superstitious veneration.—*Un. Hist. Gen. Biog.*

ZISPATA, a bay of the Spanish Main, on the coast of South America; 90 miles south of Carthagena.

ZISPATA, a settlement of New Granada, in the province of Carthagena, situate on one of the arms of the river Cauca.

ZITAQUARO, a settlement of Mexico, in the intendency of Valladolid, containing 150 families of Spaniards, mestizoes, and mulattoes, and 115 of Indians.

ZITARA, a village of South America, in New Granada, and capital of a district to which it gives name, in the province of Choco. In the interior of Choco, the ravine of the Rspadura unites the sources of the river Noanama or San Juan, with the river Quito, which forms, with the Andegada and the Zitara, the considerable river Atrato. The river San Juan flows into the South sea; and a monk of the village of Zitara, caused his flock to dig a small canal in the ravine above mentioned, by which, when the rains are abundant and the rivers overflow, canoes loaded with cacao, pass from the Atlantic to the Pacific ocean. This communication has existed since 1788, unknown to even the Spaniards themselves; the distance of the mouths of the Atrato in the bay of Panama, to the estuary of the river San Juan, being 75 leagues; 120 miles south-west of Santa Fe de Antioquia, and 210 north of Popayan. Lat. 6. N.; long. 76. 30. W.

ZITLALA, a settlement of Mexico; 60 leagues south-west of Mexico, containing 175 families of Mexican Indians.

ZITLALTEPEC, a settlement of Mexico; 1 league west of Mexico, containing 90 Indian families.

ZITTAU, a town of Germany, in Saxony and Upper Lusatia, on the Mandau, a small river which falls into the Neisse, at a little distance from the town. It is pleasantly situated in a small valley, surrounded by hills, and retains its old fortification of a double wall and moat. It is tolerably built, contains a work-house, an orphan-house, a theatre, several schools, and a population of about 7200. This is a manufacturing quarter, and the inhabitants are employed partly in making woollen, linen, and leather, partly in dye-

ing and bleaching. Zittau is, in a manner, the centre of the linen trade of a considerable part of Lusatia; its district containing no less than 15 manufacturing villages. The town, however, has suffered severely by different calamities. In 1757 it was bombarded by the Austrians, set on fire, and pillaged by their irregulars. In 1786 an accidental fire destroyed a number of buildings; 47 miles east-by-south of Dresden.

ZITTER, or SETTER, a small river of Switzerland, which rises in the canton of Appenzel, and falls into the Thur.

ZIVOLO, a name by which some authors have called the smaller species of yellow-hammer, from its constant note, which is only *zi, zi*.

It is of the size of the common sparrow; its beak is thick and short; its breast and belly yellowish, spotted with brown; and its head, back, wings, and tail, of a dusky brown, but two of the tail-feathers on each side have a variation of white.

The difference between the male and female in this species is, that the male is yellow, and has some yellow spots on its neck and sides, which are wanting in the female. It is almost always seen on the ground, and feeds on seeds, &c. It seems but little if at all essentially to differ from the common yellow-hammer; and Mr. Ray has some suspicion that they are the same species.

ZIZANIA [plural of *ζιζανιον*, which some interpret lolium; in our translation of the New Testament it is Tares, but very erroneously], in Botany, a genus of the class monoecia, order hexandria, natural order of gramina gramineæ, (*Juss.*) Grasses.—Generic Character. Male flowers below the females. Calyx none. Corolla: glume two-valved, valves lanceolate, awnless, membranaceous, nerved, embracing the outer bigger. Nectary two-leaved; leaflets ovate, obtuse. Stamina: filaments six, capillary, very short. Anthers linear, bifid, scarcely the length of the corolla. Female flowers in the same panicle, bigger. Calyx none. Corolla: glume two-valved, closed, gaping only above the germ; outer valve bigger, hollow, long, straight, embracing the inner on both sides, rigid, ending in a long straight awn; inner narrower, lanceolate. Nectary two-leaved; leaflets ovate, rounded. Stamina: filaments six, minute. Anthers small, barren. Pistil: germ ovate. Styles two, very small. Stigmas feathered, eminent. Pericarp none. Glume closed, permanent. Seed single, oblong, equal, shining, naked.—*Essential Character.* Male—Calyx none. Corolla: glume two-valved, awnless, mixed with the females. Female—Calyx none. Corolla: glume two-valved, cowlid, awned. Style two-parted. Seed one, clothed with the plaited corolla.

1. *Zizania aquatica*.—Panicle racemed below, spiked above. Root annual. Culm two feet high, obliquely erect, covered all over with the sheaths of leaves. Branches two, opposite, from the base of the culm, flower-bearing. Leaves five or six, even, wider than those of the common reed, with smooth sheaths.—Native of North America: in great abundance in the lakes of Canada. These seeds, which are as large as oats, and perhaps as nutritive, are used by the Indians for food.

2. *Zizania Hispanica*.—Root annual, leaves stalked and narrow. Flowers numerous, calyx hispid.—Native of Spain.

ZIZELITZ, or SCHISSELITZ, a town of Bohemia, on the river Czidlina, with 800 inhabitants; 43 miles east of Prague.

ZIZENHAUSEN, a village of Germany, in Baden, near Stockach.

ZIZERS, a town of the Swiss canton of the Grisons. Population 800.

ZLABINGS or ZLAWONETZ, a small town of Moravia; 35 miles west-by-north of Znaym.

ZLIN, a town of Moravia; 13 miles north-north-east of Hradisch. Population 1900.

ZLOCZOW, a circle of Austrian Galicia, on the borders of the kingdom of Poland, to the east of the circles of Lemberg and Zolkiew. Its area is 2000 square miles; and its population exceeds 200,000. It is watered by the Bug and Stry, besides a number of smaller streams.

ZLOCZOW, a town of Austrian Poland, and the capital of a circle of that name. It contains 6200 inhabitants, and has a large public school; also a manufacture of canvas.

ZMEMOGORSKAIA, a strong fortress of Asiatic Russia, in the district of Semipalatnoi.

ZMIJEV, a small town of European Russia, in the government of Slobodsk-Ukraine, on the Donez; 23 miles south-by-east of Charkov.

ZMILACES, a name given by Pliny to a stone found in the river Euphrates, resembling marble, and of a blueish-green colour.

ZMILAMPIS, the name of a gem, described by Pliny and the ancients, which they tell us was very like the Proconnesian marble, except that in the centre of the stone there was always a blueish spot, resembling the pupil of an eye.

ZMILANTHES, a name given by Solinus and some others to a gem called by the more correct writers *zmlanpis*.

ZNA, a small river of the interior of European Russia, in the government of Tambov, which falls into the Mokscha.

ZNAYM, a circle of the Austrian empire, containing the south part of Moravia, and extending along the borders of Lower Austria, between the circles of Iglau and Hradisch. Its area is 1300 square miles; its population 134,000. It is generally hilly, but more particularly so in the west and north. It is not, however, deficient in fertility: madder has been cultivated for some years near the town of Znaym; and the vines of the district of Austerlitz are of good quality. Sheep are numerous, and the wool trade is considerable: it is chiefly in the hands of Jews.

ZNAYM, the chief town of the above circle, situated near the Theya. It contains some good public edifices, such as the Carthusian monastery, the abbey of Luka, an old palace, and a council-house. The chief square is also surrounded with houses ornamented with a piazza; but the rest of the town is ill built. It has a citadel; also a grammar school, a college, a Dominican convent, and 5200 inhabitants: 46 miles north-north-west of Vienna, and 33 south-west of Brunn. Lat. 48. 31. 15. N. long. 16. 1. 57. E.

ZOARA, a small seaport of Tripoli, in Africa; 60 miles west-south-west of Tripoli.

ZOBING, a market town of Germany, in Lower Austria; 3 miles north of Krems.

ZOBING, a village of Germany, in Wirtemberg; 8 miles west-north-west of Nordlingen.

ZOBLITZ, a town of Germany, in Saxony, on the borders of Bohemia. It has manufactures of yarn and lace; and also a manufacture of a stone found in the vicinity, into pitchers and other vessels; 32 miles north-west of Dresden. Population 900.

ZOBTEN, or ZOTTEN, a town of Prussian Silesia; 24 miles west-south-west of Breslau. It has a large church. Population 1000.

ZOBTENBERG, ZOROTENBERG, a mountain of Prussian Silesia, in the principality of Schweidnitz. It is 2600 feet high.

ZOCAUS, a river of Quito, in the province of Quixos and Macas, which enters the Putumayo.

ZOCHICOATLAN, a town of Mexico, containing 124 Indian families; 90 miles north-east of Mexico.

ZO'CLE, *s.* A small sort of stand or pedestal, being a low square piece or member, serving to support a busto, statue, or the like, that needs to be raised; also a low square member serving to support a column, instead of a pedestal, base, or plinth.

ZOCONUSCO, a settlement of Mexico, in the intendancy of Valladolid, containing 295 Indian families.

ZODIACAL, *adj.* Relating to the zodiac.—A philosophical explanation of the *zodiacal* system. *Warton.*

ZODIAC (Zodiacus). See ASTRONOMY.

ZO'DIACK, *s.* [*zodiaque*, Fr.; *ζωδιακος*, εκ των ζωνων, Gr. the living creatures, the figures of which are painted on it in globes.]—The track of the sun through the twelve signs; a great circle of the sphere, containing the twelve signs.

The golden sun salutes the morn,
And having gilt the ocean with his beams,
Gallops the *zodiack* in his glist'ring coach. *Shakspeare.*

It is used by Milton for a girdle.

By his side,
As in a glistering *zodiack*, hung the sword
Satan's dire dread; and in his hand the spear. *Milton.*

ZODIN, a small town of Russian Lithuania; 30 miles east-north-east of Minsk.

ZOETERWOUDE, a village of the Netherlands; 3 miles south of Leyden. Population 2000.

ZOFFANY (John), was born at Frankfort, about the year 1735. He came to England, as a painter of small portraits, when he was about 30 years of age. After passing some time with very little encouragement, he at length was fortunate enough to attract public attention by a portrait of the earl of Barrymore, and thenceforward enjoyed considerable favour and encouragement. The most considerable of his productions were portraits of the most celebrated dramatic performers in their favourite characters; as Garrick, in *Abel Dragger*, *Sir John Brute*, and *Lord Chalkstone*, &c.; Foote, in *Major Sturgeon*; and *Jacob*, as *Jacob Gallop*; Foote and Weston, as *Dr. Last* and the *President*, in the *Devil on Two Sticks*; *Parsons*, *Moody*, *Bransby*, *Aicken*, and many others, whose likenesses he preserved most admirably, with all the variety of expression required for the characters they personified. One picture he painted of the members of the Royal Academy, in the hall of the Academy devoted to the study of the living figure, round which they here assembled, and it received universal applause.

He had the honour to be employed by his Majesty, and painted portraits of the royal family; and he was engaged by the queen to paint for her a view of the Tribune of the Gallery at Florence. He was somewhat of a humourist, and it is said of him that, whilst he was engaged painting in the Florentine Gallery, the emperor of Germany visited the grand duke, and coming up to Zoffany in the Gallery, was much pleased with his performance, and asked him his name; and on hearing it, inquired what countryman he was, when he answered, an Englishman. Why, said the emperor, your name is German. True, returned the painter, I was born in Germany—that was accidental: I call that my country where I have been protected.

Soon after his return from Italy he went to the East Indies, where he was much employed, and acquired a considerable fortune; but it disappeared upon his return home, and was only restored by a second adventure to the same hot-bed of wealth and disease. He again returned to England, but with diminished powers; yet he still continued to paint, and, among other works, produced an elaborate picture of the sacking of the wine-vaults at the Tuilleries, in 1792; a disgusting display of the atrocities of that eventful period. He lived to a very advanced age, but was reduced exceedingly in intellectual powers for some years before his decease, which happened in 1808. He was a member of the Royal Academy.

ZOLKIEV, a circle of Austrian Galicia, lying between the kingdom of Poland and the circle of Lemberg. Its area is 1800 square miles; its population nearly 200,000.

ZOLKIEW, a town of Austrian Poland; 10 miles north of Lemberg. It has a high-school, and a military hospital. Population 2200.

ZOLLIKON, a large village of Switzerland, on the east side of the lake of Zurich.

ZOLODONOSKA, a small town of Russia, government of Pultawa, on the Dnieper.

ZOMBOR, a town of Hungary, in the palatinate of Bacs, or Batsch, a province extending, in an oblong form, between the Theyss on the one side, and the Danube on the other. This place is nothing more than an assemblage of cottages, with few public buildings, except a Catholic and a Greek church, along with the government offices requisite for the collection of taxes, and other public business. Cattle, corn, and country products, form the chief objects of traffic at

Vol. XXIV. No. 1675.

Zombor. Lat. 46. 45. 45. N. long. 18. 7. 45. E. Population 15,000.—There is another place of the name Zombor in the west of Hungary, near Tokay.

ZOMETLA, a settlement of Mexico, near the city of Mexico, containing 91 Indian families.

ZON, a town of the Netherlands, in North Brabant, with 11,000 inhabitants.

ZONE, *s.* [*ζώνη*, Gr.; *zona*, Lat.] A girdle.

The middle part

Girt, like a starry *zone*, his waist, and round
Skirted his loins, and thighs, with downy gold,
And colours dipp'd in heav'n. *Milton.*

A division of the earth.—The whole surface of the earth is divided into five *zones*: the first is contained between the two tropicks, and is called the torrid *zone*. There are two temperate *zones*, and two frigid *zones*. The northern temperate *zone* is terminated by the tropick of Cancer and the arctick polar circle; the southern temperate *zone* is contained between the tropick of Capricorn and the antarctick polar circle; the frigid *zones* are circumscribed by the polar circles, and the poles are in their centres.

And as five *zones* th' etherial regions bind,
Five correspondent are to earth assign'd:
The sun, with rays directly darting down,
Fires all beneath, and fries the middle *zone*. *Dryden.*

Circuit; circumference.

Scarce the sun

Hath finish'd half his journey, and scarce begins
His other half in the great *zone* of heaven. *Milton.*

ZO'NED, *adj.* Wearing a zone.

Gay youths advance,

And fair-*zon'd* damsels form the sprightly dance. *Pope.*

ZONITIS, in Entomology, a genus of the coleoptera order of insects, the characters of which are, that the antennæ are setaceous; the palpi four and filiform, and shorter than the whole jaw; and the lip emarginated. There are two species.

1. *Zonitis chrysolomelana*. Yellow, the wing-sheaths having a point in the middle, and the apex black.—Found in Egypt and the East.

2. *Zonitis flava*. Reddish, with wing-sheaths yellow, and black at the apex.

ZONNAR, a kind of belt, or girdle, of black leather, which the Christians and Jews of the Levant, particularly those of Asia and the territories of the grand seignior, are obliged to wear, to distinguish themselves from the Mahometans.

Hence, as most of the Christians of Syria, Mesopotamia, &c. are either Nestorians or Jacobites, those sectaries are often called Christians of the girdle.

ZONS, or SONS, a town of the Prussian states, province of Cleves and Berg; 8 miles south-south-east of Dusseldorf. Population, 1000.

ZONZERON, a settlement of Brazil, in the province of Sergippe.

ZOO'GRAPHER, *s.* [*ζωη* and *γραφω*, Gr.] One who describes the nature, properties, and forms of animals.—One kind of locust stands not prone, or a little inclining upward; but in a large erectness, elevating the two fore legs, and sustaining itself in the middle by the other four: by *zoographers* called the prophet, and praying locust. *Brown.*

ZOO'GRAPHY, *s.* [of *ζωη* and *γραφω*, Gr.] A description of the forms, natures, and properties of animals.—If we contemplate the end, its principal final cause being the glory of its Maker, this leads us into divinity; and for its subordinate, as it is designed for alimential sustenance to living creatures, and medicinal uses to man, we are thereby conducted into *zoography*. *Glanville.*

ZOO'LOGICAL, *adj.* [from *zoology*.] Describing living creatures.

ZOO'LOGIST, *s.* [from *zoology*.] One who treats of living creatures.—Nor have I seen any thing that interested me as a *zoologist*, except an otter. *Johnson.*

ZOOLOGY, *s.* [from the Gr. ζῷον, *life*, and λόγος, *doctrine*.] The doctrine of life; the laws of animated existence.

INTRODUCTION.

In the body of this work, when treating of the different genera into which living beings have been divided, we have spoken so largely on the habits and forms of animals, that we have nothing further to supply under the present head, than some account of their anatomy or internal structure. This, also, has been, in a slight degree, anticipated in the article ANATOMY (COMPARATIVE). But the accessions that have been made to Zoological science since that was written, are so numerous and important, and the article itself was so strictly confined to an exposition of those facts that serve especially to illustrate human anatomy, that it is imperative on us, in this place, to investigate as fully as our prescribed limits allow, into the structure and functions of animals.

In attempting to define the elements of which animals are composed, we are, at first sight, much embarrassed by the discovery of this fact. That the chemical constitution and the physical appearances of living parts vary not only with every animal, but with every part of the same animal; and the gradations that exist, are not only thus numerous, but are so changeable that we are utterly lost in the multiplicity that surrounds us.

Yet the simpler movements into which the more complicated motions of animated beings are resolvable are so few, that if we take them as a basis of investigation, and endeavour to determine, 1st, what are life's primary actions, and, secondly, what are the structures to which these actions are united, we shall find the whole of the wonderful processes of animated existence effected in a manner beautifully perfect by *three* elementary parts.

We have stated, in the article PHYSIOLOGY, that in plants, which form the lowest grade of existence, the chief vital acts that are performed, are the *imbibition, circulation, and conversion into their own substance* of the air and water which surrounds them. Further, we said that the part which performs this office is a tube which is of such small dimensions, that it may be denominated capillary, (indeed, that term is also appropriate on account of its mode of action, which is analogous to capillary attraction,) and vital, because it is not merely a capillary tube which can imbibe and circulate the fluid presented to it; but one which is only effected by particular fluids, and which changes them as they pass along it, either by decomposing their elements or by effecting new combinations. The existence of the VITAL CAPILLARY TUBE in all parts of most animals, has been rendered certain by the injections of skilful and laborious anatomists; but their existence required no such demonstration. For if a seed or an animal *grow*, this must arise evidently from some addition of matter; and since it is certain, this addition arises not from accretion, but from an internal growth, it follows that there must be some *canal* to carry it along the interior of the plant or animal; but since, when it is in the interior, it does not remain in its original state, but is changed into a peculiar substance, it follows that this canal has not only the power of imbibing and carrying matter, but also of subjecting this to chemical decomposition. Now it matters not what the form of this canal may be. It may be a cell, large in itself, communicating by small openings with others, forming thus a *cellular tissue*, or by large openings, an arrangement which produces a *reticular* texture. But ordinarily, from the flower to man, beings that are endowed with life, are manifestly composed of slender tubes running in various directions and separable into different kinds, according as they receive fresh materials for growth or expel redundancies, according as they are of one colour or another, and according as they are clearly defined or contorted and convolved on themselves.

The fact here stated, admits not, in our present state of knowledge, and indeed will scarcely ever admit further ex-

planation. The power that fine tubes of glass or metal possess of imbibing fluids and carrying them upwards against the force of gravity, bears some resemblance to the imbibing and circulating powers in question; and the circumstance that glass attracts water more than metal, inasmuch as it tends to shew that the phenomena of capillary attraction depend on a chemical attraction existing between the fluid imbibed and the imbibing vessel, serves to give some hint that the assimilating power of living vessels depends on the specific powers of attraction that their coats possess. But it will require study for ages to discover the laws of these attractions. In the mean time, we content ourselves with the undeniable fact, that a seed thrown into the earth, doth, by the innate powers of its vessels, imbibe the surrounding water and air, and has these circulated throughout its substance by vessels that produce successively the root, the stem, the leaves, flower, and the fruit. We must content ourselves with knowing, that in our own persons these vessels open into our stomachs and lungs, thence imbibe the materials for our existence, and deposit perishing materials, even as an acorn swells with imbibed moisture and grows; and that in the whole race of animals, from the thin bag of membrane that is termed the hydatid, through all the gradations of creatures that swim through the water, fly through the air, or walk upon the earth—to Man—the perfection of the whole—all are composed of these vessels; that every sustenance those are capable of deriving, are by these assimilated; and that all the products, or, as they are technically termed, secretions, these pour forth, are formed by the same. From the black ink, which defends like a cloud the cuttlefish, to the glowing hues that adorn the peacock's tail; from the disgusting odour of the pole-cat, to the balmy breath of the cow; the warm fur, the impenetrable hide, solid hoofs, tough claws, irrefragible teeth, fair hair, smooth skin, and shining eyes, all are the product of secretion; and the wondrous power of the vital tube is, in animated existence, what the law of attraction is in the inanimate world.

It will strike every one, that the knowledge of the particular powers of particular vessels must be highly important, and would properly form the next step of our enquiry; but, beyond the general exposition we have made, we have nothing to add. These vital tubes are different with every part they occupy. A bundle of them, denominated the liver, separates from the same materials a fluid totally different from the fluid separated by those that form the kidney. One set of vessels makes hair, another teeth, &c.; but no one has formed even a conjecture as to the causes on which these changes depend. All that can be said is, that every part has its particular powers, unknown and unknowable; and the vascular frame-work of the body is constant only in this law, that it always imbibes and circulates, partly assimilates, and partly rejects.

The next part which, in the article above referred to, we said was found distinct in power and in appearance from the general structure of animals, is a CONTRACTING FIBRE.

This part exists plainly, almost uniformly, wherever the slightest motion is visible. There are only a few gelatinous animals which shorten themselves when touched, and in whom contracting structure and vital tubes seem to co-exist without apparent difference, but blended as it were into an homogeneous mass. With these few exceptions, animals are furnished with parts composed of fibres that shorten themselves when *stimulated*. The word stimulation, which requires some explanation, implies simply this fact, that fibres of a given length shorten themselves when touched by a foreign body, or when a part that enters between these fibres and is called a nerve, is touched. As this phenomenon bears no similitude to the impulse that is given by one moving body to another, but depends upon some innate quality of the fibre itself, it is called stimulation. All enquiries into the means whereby contraction is effected, or into the mode by which touching a muscle or its nerve acts so as to stimulate them, are futile; no one knows any thing of the matter, nor probably can know. It is enough, however, to be in possession of the facts; for we have here a power of infinite advantage

vantage to the purposes of life. Possessed of this fibre, an animal, expanded to its full dimensions, can, on the approach of danger, contract itself into a small space, and into a covering of safety, or can move one part of its body towards another so as to lay hold on prey, or can push forth its extremities so as to use the media in or upon which it rests, as fixed points for moving its body from place to place. But we shall not, in this place, investigate further the various modes in which this simple power may be applied to complex movements, since this will be better seen in the sequel. It remains only to remark in this place, that the appearance of the muscular structure is as various as that of the vascular.

The third elementary part, referred to in the article *PHYSIOLOGY*, was the *NERVE*. We already somewhat anticipated the use of this part, by stating that muscular fibres are moved to contract, if the nerves that enter them are touched; and we may see at once how useful this circumstance must be, inasmuch as the movements of distant muscles may be thereby concatenated. But, independent of exciting muscular actions, nerves communicate to our consciousness an impression of *feeling*. We stated, in the article before mentioned, that it had been discovered by Mr. Charles Bell, that these two powers resided in different kinds of nerves, at least in general. But there are a third class of nerves, which preside over the assimilating functions, that excite the vessels or contractile fibres on which one of their extremities terminate when the other is irritated, and which we are unable to divide into the two classes of movent and sentient; indeed, to talk of these as sentient appears an error in terms, seeing that nothing can be called sentient of which we have no consciousness. The difficulty is easily got over by stating that these nerves are simply movent, and, of course, like all movent nerves, capable of stimulation. Still it may be conjectured that this power is analogous to sensation. In diseased states nerves actually become sensitive.

We find that when the nerve of one part terminates in the nerve going to another, a swelling is produced at the point of union, called, if small, a *ganglion*, (or more properly, by the Germans, a nerve-knot); but, if large, a *brain*. In both these one change is remarked, that the impression that the one nerve has received commands, if we may use the term, the other, to set in motion the muscular fibre or secreting tube. In the smaller ganglions, this, no doubt, takes place instinctively, and in obedience to a law as strict and undeviating as that which governs any property of dead matter; nor is there probably any difference in the power of the two nerves. But in time we observe that this action becomes modified by repetition, so that, as it were, *habit* is produced. Next we see obscure dawns of powers, that bear some analogy to those which our internal conviction informs us we possess ourselves; for pleasure and pain, memory and *association*, *affection* and *passion*, become apparent. And, lastly, we entertain the strongest presumption, that in ourselves the same structure is inhabited (if such a term be allowed in speaking of the immaterial) by *reason* and *will*.

We shall not carry further in this place our analogies of the nervous properties, contented with these facts:—1. That nerves set distant vessels and muscles in motion, sometimes in consequence of a preceding impression, sometimes without this. 2. That ganglia are the centres to which external impressions are carried, and from which moving impulses depart.

The existence of the three preceding parts being allowed, we profess to shew that, separately or combined, they and their products compose the whole animal kingdom.

The vital capillary tube forms, in all animals, far greater proportions of the systems that assimilate food and air, and engender progeny than any other; in a few animals, as in nearly all plants, it forms them entirely. Muscular and nervous fibres are added, but even the highest animals only in small proportions. The nerves particularly are but thread-like fibrils; and the highest development of the muscular fibres in these systems are seen in the hearts of mammalia and the stomachs of birds.

On the other hand, the systems that hold an animal in relation with the surrounding world, the prehensile and locomotive organs, are almost entirely composed of muscles and nerves. All the limbs of land animals, nearly the whole body of fishes and birds, are composed of large masses of muscular fibres, commonly called lean, and these are set in motion by large nerves, that have a communication with each other at divers points; so that there remain only so much of the capillary vessels as are necessary to keep the preceding structures in constant repair.

The very different proportions in which these elementary substances are combined form then a marked and leading division of the systems of an animal. The first class are concerned in the digestion of food, and its assimilation; in excretion, nutrition, and generation. The second class comprises the organs of prehension, voice, and locomotion, and the senses. We premise a general view of these organs preparatory to a particular account of them in different classes.

Of the digestive system.—The digestive organs are more invariably met with in the animal kingdom than any other of the compound systems. In some it is a mere receptacle, open at one end, which receives the fluid in which the animal is placed. The innumerable capillaries, which open on its inner surface, imbibe the nutritious particles, and bear them throughout the animal, to form its substance; while the remaining or innutritious portion of the matter received is ejected by the opening that gave it entrance. But this is not the general type of the alimentary canal. It may be universally described as a *tube*, running throughout the animal, supplied with—1, one order of capillaries, called *secrements*, to secrete a solvent juice; 2, another order of the same vessels, denominated *absorbents*, to imbibe the nutrient particles; 3, muscular fibres, variously disposed, which carry onwards the food; 4, a few nerves, in which reside the sensation of hunger, and which preside over the movement of the vessels and muscles. Various are the appearances this alimentary canal exhibits, sometimes being half the length of the animal, sometimes coiled in convolutions, which, when unravelled, extend to several times its length. The internal coat, rarely smooth, is thrown in folds or irregularities, that vary from mere rugæ to a perfect honeycomb structure, or a surface covered by long and numerous projections. In like manner the capillary vessels, coiled upon themselves, form around or in the neighbourhood of this tube glands that permit a more complete elaboration of the fluids presented to them than could probably be effected by tubes of short dimensions. The glands that are most constant have acquired various names, as the liver, pancreas, &c.; and, in the higher animals, we have made some faint approaches towards a discovery of the particular part they play respectively in the digestive function.

The processes that are carried on in the most perfect specimens of digestion are—1, trituration; 2, solution; 3, the separation of the nutrient from the excrementitious portions of the food; 4, the assimilation of the former, and the ejection of the latter. The most superficial reflection must suggest that these processes are not all of them necessary in equal degrees; that animals may exist whose food is so delicate that it requires no trituration, while others may take nourishment so nearly approaching the constitution of their own bodies, that almost all of it may be assimilated, and the excrementitious portion reduced to the smallest proportions.

The alimentary canal may be divided into various parts, according to the part it takes in these processes; thus the first portion, which is merely for taking in the food, is called the *oesophagus*; the second, which is the part where it is dissolved, is called the *stomach*; in the *smaller*, or first *intestines*, the separation of nutritious from excrementitious matter is effected, and the former absorbed. In the *large*, or lower intestines a partial absorption is continued, and the excrement propelled to the termination of the whole. The process of trituration also, when not performed previous to deglutition, is effected in the stomach, as happens in birds, lobsters, &c.

The nutrient portion of the food that is taken up by the absorbents,

absorbents, undergoes, while in those vessels, a still further change ere it is converted into the structure of the animal. In a few of the very lowest animals these vessels carry the nutrient matter directly to the rest of the body, building up the different organs, as it were, by its own powers. But this simple process seems inadequate to the production of the more complicated structures, or of parts that require constant accession of nutriment; and hence we observe that these vessels form an homogeneous fluid, of a constant appearance, which they pour into larger tubes. These, without materially changing the fluid, circulate it from one end of the body to another with wonderful rapidity—with a rapidity far greater than the absorbent vessels could effect. This fluid, then, into which all nutrient matters flow, and whence all the structures are formed, is called, in the animals of the higher orders, *blood*, *sanies* in the lower, and may be likened to the *sap* of plants. All these fluids resemble each other in being separable into a coagulum, and a fluid that is not solidified by heat or chemical agents.

Of the blood-vessel circulation.—The vessels that receive blood are too large to act on the principle of capillary attraction, or any other power analogous thereto. The aid of the contractile fibres is here required. The larger vessels are surrounded by rings of these fibres, which, alternately contracting and dilating, propel the blood rapidly through the body. In a few animals these fibres exist uniformly along the whole blood-system, but in the majority they are collected into a large mass at a central point, and here are denominated a *heart*. The heart is very soon divided into two cavities; one, which propels the blood through the body, is called the *ventricle*; one, (an *auricle*) that merely collects the returning blood, while the other is in action, then pours that fluid into the latter with a sudden gush, and thus affords a due quantity for the full impulse of the ventricle's fibres. The necessity that arises for two cavities, in order to effect a vigorous circulation, arises from this circumstance. The blood is brought to the heart by veins, which are large vessels, formed by the union of capillary vessels, and the power of the latter forces the blood in the former, even to the central point; for veins have no contractile fibres, and are too large to possess the attracting power. They are furnished, indeed, with valves, that prevent the return of blood, but these cannot, of course, contribute to its advance. Now, as the supply from the veins is constant and uniform, there is always a quantity of blood pressing for entrance into the heart. If there had been but a ventricle to receive it during the long contraction of this cavity, the veins must become enormously distended; but the auricle prevents this, for though, of course, during its contraction, the veins must be somewhat distended, yet this is but for a moment, the auricle requiring but a very brief contraction to throw its contents into the adjacent ventricle. But in perfect hearts we have *four* cavities; in order to explain the reason of which we must first give an account of the process of aeration, this function being intimately connected with the complexity of the heart.

Of the respiratory function.—There is no plant or animal that can live without air. The contact of this fluid is as material to the formation and growth of the body as food. In the article Physiology, we have stated that the change which the air effects on the fluids of animals is a union of the carbon contained in these fluids with that portion of the air which is called oxygen, and the consequent production of carbonic acid gas. 2. That this is expelled from the body. 3. That there is an evident connexion between this process and the temperature of the animal, but that both calorification and aeration depend, in a great degree, on the influence of the nervous system in all the higher animals. It was hinted, also, that besides the more evident change, some finer one, of an electrical nature, may be also effected during breathing.

Though all animals breathe, they have not all pulmonary organs. In a few the blood, flowing through the vessels on the skin of the body, becomes aerated through pores. In others, manifest air-vessels carry the air from the surface to the internal parts; these are called *tracheæ*. In others, a

large internal structure is formed by extended meshes of porous blood-vessels, and over these a quantity of aerating fluid is driven. The fluid in question flows in at the mouth, and out by another aperture; such respiratory organs are called *gills*. The more perfect of breathing creatures have *lungs*, organs into which pure air is drawn by muscular effort, and impure ejected by that power, both kinds passing through the same aperture.

Now in animals that breathe by the skin, it is clear that no extra circulating organs are necessary; and even in those which have separate respiratory organs, if they do not require to throw off carbon in abundance, or to evolve much heat, a vessel, branching from the main trunk, may carry to the air these organs contain a considerable quantity of blood, and this, being aerated, may be returned to the general mass, which becomes, therefore, partially purified. Here a heart, composed only of an auricle and ventricle, is sufficient. But the higher animals require that every particle of the blood should be submitted to the influence of the air, and therefore they have two circulations, one composed of an auricle and ventricle, to circulate impure blood through the lungs, and one composed of similar cavities to circulate purified blood through the body.

It will be seen, from the observations preceding the last paragraph, that whatever other functions the respiring system performs, it is an emunctory—that it gives out from the blood matter, which, if retained, would unfit that fluid for its offices. But there are several other structures that pour forth secretions from the blood for no other apparent purpose than their speedy ejection from the body. Thus the lower part of the alimentary canal, in the higher animals, is constantly being filled by large quantities of excrementitious matter. The skin and the urinary organs are the other main parts for excretion.

The skin and urinary organs.—The surface of the body in the lowest animals receives all that is received, and rejects all that is rejected, and hence is at once stomach, lungs, and every other viscus. In others, covered with hard shells or impervious scales, its office is confined to secreting these substances. In the mammalia and man it is constantly transpiring, and affords that peculiar odour that distinguishes one species from another, and even man from man. Its products are too various to allow us to enumerate them in this general view.

The urinary organs are the parts that separate the water from the blood, and with this several salts which it contains. The water passes originally into the blood from the alimentary canal, through absorbents; not, however, through the same absorbents that carry the chyle; on the contrary, aqueous fluids may be imbibed from the stomach itself, or from the lower end of the intestine. The water, after circulating along with the blood, is separated from a great portion of it by an artery that branches out into a congeries of capillaries, which get the name of *kidney*. These secrete the urine, and return the blood to the circulation in a venous state; the urine itself is poured by a duct, called a *ureter*, into a receptacle, called a *bladder*, where it collects in large quantities. The kidneys are the parts most generally found.

The locomotive system.—It seems useless to attempt a classification of the locomotive system in animals, for this is extremely diversified. Two great divisions may be made of those which move upon solid matter, and those which use the fluids in which they are placed, as resisting media against their muscular efforts. Both classes admit innumerable subdivisions, according as we consider the various modes in which they use these media as means of locomotion.

“The most simple progressive motion,” observes Sir Everard Home, in the first volume of his *Comp. Anatomy*, “that can be imagined, is that belonging to those blubbers of different descriptions which, from their structure, are nearly of the same specific gravity with the sea they inhabit, and, from their expanded form, are enabled to float upon its surface, moving with the waves on which they are supported, and in this way passing from one place to another, and catching the food necessary for their support. Next to this

this

this is the progressive motion which does not wholly depend upon the motion of the water, whether it arises from the winds or the tides, but where the animal itself is impelled by the wind, and has parts peculiar to it fitted for that purpose.

"Some of the mollusca float upon the surface of the sea, and have their motion assisted by means of something resembling a sail. The most beautiful contrivance of this kind is in the Portuguese man-of-war (*Holothuria Physalis*). The lower part of the animal consists of innumerable tentacula hanging in the water; the upper is an oval bag distended with air: when examined in the moist state, there is found a small valvular aperture, the size of a hog's bristle, near the pointed end, and another of a smaller size near the opposite end, with a thickened edge, which looks like a dark spot transparent in the centre. There are preparations in the collection made by Mr. Hunter to shew both these openings. Dr. Telesius, of St. Petersburg, who had the opportunity of seeing these animals alive, has given elegant engravings of them, and particularly describes the two orifices, of which no account had been before published. Some of the species he has delineated had a crest attached to the upper part of the bag, in a concave form, with transverse gelatinous bands, by the contraction of which it could be occasionally depressed, and afterwards raised by its own elasticity."

The next mode in which progression is effected in water, is by *swimming*.

"A fish in swimming, after having bent the tail, extends the dorsal, anal, and caudal fins, so as to increase the surface, and steady its body in the water. Having extended the tail, it contracts the fins until the tail is again bent. The stroke of a fish's tail does not propel the fish straight forwards, but obliquely: to move forward, it must bend the tail first a little to the right side, and after making this stroke, bend it to the left so as to be propelled a little to that side; and thus the fish's motion is in a zigzag direction. As fishes breathe through the medium of water, and are specifically heavier than the medium in which they live, they require some assistance to keep them from sinking to the bottom while swimming; this purpose is answered by air bladders, which the fish can at pleasure supply with air, so as to vary its specific gravity, as occasion requires. There are fishes, however, which have no air bladders, and therefore cannot rise far from the bottom of the waters in which they live; they are broad and flat in their form; their mode of swimming is different from that of common fishes; it consists in raising themselves by the motion of the lateral fins, and pressing perpendicularly against the water."

The whales strike the water from below downwards, instead of from side to side.

Water-birds, turtles, and frogs, may be said to *row*, since they use their legs as oars.

The last and the most difficult mode of using fluid media for progression is *flying*. The communications that exist between the lungs and bones of birds render them so light, that they require less muscular exertion than would otherwise have been necessary. Still this is exerted to a great degree.

"In swimming, the lower extremities, of whatever form, are the principal parts employed—but in flying, the upper extremities are the parts used; and those which correspond to the lower extremities of other animals take no part in this mode of progressive motion, but are destined for one of another kind; and the tail is added to direct their movements. The act of flying is performed in the following manner: the bird launches itself into the air, either by dropping from a height, or leaping from the ground: it raises up at the same time the wings, the bones of which correspond very closely with those of the human arm; but instead of the hand there is properly only one finger; it then spreads out the wings to their full extent, in a horizontal direction, and presses them down upon the air; and by a succession of these strokes, the bird rises up in the air with a velocity proportioned to the quickness with which they succeed each

other. If the intervals between them are lengthened, the bird remains on the same level, and when made still greater it descends. This vertical movement can only be performed by birds whose wings are horizontal, as is probably the case with the lark and quail. In general the wings are oblique: this is principally owing to the length of the feathers, the fixed point of which is at the root. When birds fly horizontally, their motion is not in a straight line, but obliquely upwards, and they allow the body to come down to a lower level before a second stroke is made by their wings, so that they move in a succession of curves. To ascend obliquely, the wings must repeat their strokes upon the air in quick succession; and in descending obliquely these actions are proportionally slower.

The tail, in its expanded state, supports the hind part of the body; when it is depressed while the bird is flying with great velocity, it retards the motion; and by raising the hinder part of the body it depresses the head. When the tail is turned up, it produces a contrary effect, and raises the head. Some birds employ the tail to direct their course, by turning it to one side or the other, in the same manner as a helm is used in steering a ship. Birds and flying insects include all the animals that have regularly formed wings, and whose usual mode of progressive motion is flying, which they perform in the most perfect manner. There are, however, some particular species of fish, and the lizard, which, although they are not endowed with regularly formed wings, yet have a substitute for them, by means of which they support themselves in the air, and fly, for short distances, tolerably well. What is still more extraordinary, there is an animal, the bat, belonging to the class mammalia, which, in its internal structure, bears a resemblance to the quadruped, that is supplied with a kind of wing peculiar to itself, which may be considered as an intermediate link in the gradation between the wings of birds and those of the different animals above mentioned."

The animals that use the earth and its products as fixed points for progression, adopt a multitude of very different methods. Man, and the majority of quadrupeds, *walk*—some animals *climb*—others *creep*—others again *cling*, either by hands, as monkeys; by suckers, as the seal; or by a glutinous exudation, as some insects that run along ceilings. Most brutes *jump*; but this mode of progression is seen in its greatest perfection in monkeys, the kangaroo, and squirrels. The worm moves by elongating and retracting its rings, of which the rough processes standing against the ground, afford fixed points. When we consider the great number of these points, we are not at a loss to estimate the mode in which, when they are acted against by correspondent muscular force, this creature is enabled to penetrate so readily the solid earth. The serpents move by various modifications of the locomotive apparatus; some move by the force of their tails; some by making the scutæ of their bellies points of attachment to the earth, and then contracting and elongating their bodies like worms. The colubra, as we have noticed in the article SERPENTES, perform their quick glidings by a process which is something like that our clowns use to draw themselves along the stage on the belly, when they have placed on their backs their hands and feet. These make the cartilages of the ribs the fixed points, alternately resting on those of one side, while they draw up the other. The serpent draws both sides forwards at once, but makes the ribs, by means of the scutæ in which they terminate, the points of attachment.

However various may be the modes of progression, it is observed in all cases, that muscles, when they have contracted, have a tendency to elongate themselves to their original length, or, when stretched, to retract themselves to their original shortness. These phenomena are produced not by any vital power, but by the common *elasticity* that is met with in inanimate matter. All muscular fibres are enclosed in cells of an elastic nature; they terminate, also, in tendons or fasciæ, having a similar property; and thus not only is the necessity of many antagonizing muscles obviated, but a celerity of movement is acquired, which muscular contraction cannot effect. A fine

example of this has been mentioned in the progression of fishes. These creatures contract the muscles of one side of their bodies, and thus bend the spine, which is highly elastic. These relax, and instantly its resilience strikes the tail against the water with astonishing quickness and force. The latter movement may be aided indeed by the muscles of the opposite side, but the chief power is exactly similar to that which a bow exerts when the hands of the archer having left the string, it brings this forward and propels the arrow.

A great facility is afforded to the passage of animals along the ground by the media they inhabit. Thus the turtle, slow moving on land, can pass very quickly along the bottom of rivers; and the *foot* of some shell-fish is sufficient, when it is struck on the sea's bottom, to afford the animals a considerable change of place.

The usual division of the locomotive system of animals, has been into the class that have a skeleton; that is, a number of solid levers, surrounded by muscles, and serving as points of resistance for the latter to act on, and into a class that have these points in the form of plates or scales that enclose the muscles. There are others, again, which have for points of resistance, soft parts that are too various to allow us to attempt to draw any general picture of their nature. They, none of them, possess, however, the rapid and automatic powers of motion that belong to such as have scales or bones.

"The simplest form of the external skeleton is seen in those shells which are termed univalves, and which answers no other purpose than to defend its inhabitant, which moves by the action of the soft parts. The bivalves contract themselves on the fluid, which they admit when open, and thus propel themselves along, or turn themselves over, while others protrude their soft parts, and use these only for progression. The crustacea, and insects which have more complex movement, are covered by shells or scales united by joints, which enable these parts to move on each other, either in the manner of flexion, extension, rotation, or circumduction. The external skeleton of some animals, the earth-worm for instance, is composed of ligamentous rings, that serve at once to defend the soft parts, and afford attachment to the locomotive powers. Horny cuticle serves the same purposes in many land insects. The internal skeleton may be composed of cartilages, which may be called soft bones, being very like them in structure, or of bones that vary much in strength and density, in different parts and in different animals. The most simple bony skeleton that is met with, is where the brain and spinal marrow only are enclosed in a bony case, composed of a number of bones closely connected with one another, but readily admitting of motion. The skeletons of some fishes, the common eel for example, are of this kind. The skull incloses the brain; it also forms a defence for the organs of sense, in which the tongue may be included; and the vertebræ that compose the spine, form a canal of bone in which the spinal marrow is contained. These are the principal, although not absolutely all the bones of these fishes; and it is by their means the progressive motion of the animal is performed. The most simple addition to this skeleton is the processes of the vertebræ being elongated in different degrees in the various kinds of flat fishes; and having their bones connected to the extremities belonging to the fins, as in the turbot. The spine is also extended in many animals beyond what is necessary to defend the spinal marrow, and then forms the tail, which answers a variety of purposes. As the first and essential use is to defend the brain and its appendages, the second is to assist in respiration, and different bones are added for that purpose, rendering the skeleton still more complex. In fishes which breathe the air contained in water, there are strong cartilages, on which the gills are supported and kept apart from each other. In animals that breathe the air of the atmosphere there are ribs; these, in the snake tribe, are only connected with the spine; the other extremities are loose, and are employed, in the progressive motion of the animal; but in birds and animals there is an addition to these, the breast-bone. Although the ribs are in most animals employed entirely for the office of respiration, yet in

the flying lizard the lower ribs on each side are extended to a considerable length, and support the expanded membrane, which, in that animal, serves the purpose of wings. In the cobra-de-capello snake some of the ribs are so shaped as to support the hood from which the snake takes its name. The extremities form the next addition. In many sea-animals there are only two, called pectoral fins, as in the whale tribe, corresponding to the anterior extremities of quadrupeds. In others there are four, as in the seal and turtle, that come occasionally on shore, and in all land animals, as well as the inhabitants of the air, whose skeleton is formed of bone. The bones of the trunk and four extremities form the essential part of the skeleton, for, in the most perfect animals, no new parts can be said to be added. In the different classes of animals they bear a much greater degree of resemblance than one would reasonably expect, from the uses to which they are applied, and the coverings in which they are enveloped; and there is no evident reason for this resemblance, unless it be intended to shew that all animals in this world come from the same hand, and belong to the same general scheme of creation. In what other way can we explain the fins of the whale, having nearly the same number of bones, and a similar form to those of the human hand, although the two parts in the living animals are so exceedingly unlike? Or the still more remarkable circumstance which may be observed in the turtle, where there is even a resemblance of a thumb. Animals that walk, appear to have no general likeness in the form of their bodies to those that creep, and still less to those that fly; yet in all of them, however differently the bones are formed to adapt them to these various uses, the skeleton consists of a skull and four extremities which have a correspondence in their bones; so that, although the parts are fitted for uses not at all similar, they are all links of the same chain. The bones of the fin of the seal, which is formed for swimming, and those of the bat, which are made for flying, resemble the human hand, which has so different an office."

Bones send out processes, or are attached to hard and tough parts, which serve as weapons of attack and defence: as the sword of the sword-fish, the horns of cattle, the hoofs of horses, lions' claws, &c.

In order to render it possible to use bones as locomotive powers, it is necessary that they should be united by joints, so as to move readily on each other. "*Joints*," says Sir Everard Home, "are formed upon three different principles: the most simple is, where an elastic substance connects the two bones, and, by its thickness, and a mixture of oil in the interstices, is enabled to yield in any one direction, to the force applied to it, the oil being squeezed out of that part; the substance, like a sponge, recovering its former state as soon as the force is removed. The second is, where the two bones are kept apart from each other, by means of a liquid, or soft jelly, which serves as a centre, round which the motion takes place. The third, where the bones are covered with articulating cartilages, adapted to one another in form, and lubricated with a fluid, which makes them move with more facility upon each other. The first of these structures, which is the most simple that can be imagined, is rarely employed; it is, however, met with in the whalebone whale. Between the condyles of the lower jaw, and the basis of the skull, is interposed a thick substance, made up of a network of ligamentous fibres, the interstices of which are filled with oil, so that the parts move readily on each other. The condyles have neither a smooth surface, nor a cartilaginous covering; but are firmly attached to the intermediate substance, which, in this animal, is a substitute for the double joint met with in the quadruped, and is certainly a substitute of the most simple kind. The second of these structures, where a fluid is interposed between the ends of the bones, which are hollowed out to receive it, forming a ball-and-socket joint, is met with between the vertebræ of fishes in general; and something like this occurs in the vertebræ of man and the mammalia." In these, however, the vertebral column is little hollowed. Hence caps of cartilages unite the edges of the bones, and these caps gradually decreasing in tenacity, become, in their centre,

the

the repository of fluid, over which the vertebræ turn, as on a pivot, while they are supported by the elasticity of the cartilaginous edges.

The third of the structures mentioned by Home, i what is met with in all the members of the mammalia. They are weak in proportion to their extent of movement, are strengthened by ligaments in part, but still more by muscles.

We shall postpone any general view of the *nervous and sentient* systems, until we speak of them in detail; because, having, with regard to their functions, some peculiar views to offer, it will be more convenient to refer immediately to the facts on which these are founded.

CLASSIFICATION.

The arrangement of animals into the most convenient order for description, is generally allowed to be a task of the greatest difficulty. It has employed many of the ablest zoologists, but is at present far from satisfactory. The classification of Linnæus, (see NATURAL HISTORY,) which we have adhered to throughout this work, is not well calculated for the ready display of zootomical facts. But we have adopted the system of Blumenbach, which being only a slight modification of the former, will best enable our readers to connect this article with the descriptions of the different genera dispersed throughout this work. We have thought proper to add, however, the arrangement of Cuvier, as one very generally adopted, and, for comparative anatomy, superior to that of Linnæus. We copy with little alteration, the following exposition of these systems, from Mr. Lawrence's introduction to Blumenbach's manual of anatomy, which inestimable work, it is proper to acknowledge, we have made, in considerable portions of the rest of this article, our textbook.

The differences of structure in the organs of circulation of such animals as possess a cardiac system, indicate the following classification.

<i>Mammalia</i> , viviparous	} Heart furnished with two ventricles, two auricles; blood warm and red.
<i>Birds</i> , oviparous	
<i>Amphibia</i> , respiring by lungs..	} Heart furnished with one ventricle and one auricle; blood cold and red.
<i>Fishes</i> , breathing by gills	
<i>Insects</i> , furnished with antennæ	} Sanies cold and colourless.
<i>Vermes</i> , furnished with tentacula	

Animals may be divided into two great families; the first family possessing vertebræ, and red blood; the second without vertebræ, and most of them with white blood. The former have always an internal articulated skeleton, of which the chief connecting part is the vertebral column. The anterior part of this column supports the head; the canal, which passes from one end of it to the other, incloses the common fasciculus of the nerves; its posterior extremity is most frequently prolonged, in order to form the tail, and its sides are articulated with the ribs, which are seldom wanting. None of this family of animals has more than four limbs, some of them have two only, and others have none.

The brain is inclosed in a particular osseous cavity of the head, called the cranium. All the nerves of the spine contribute filaments to form a nervous cord, which has its origin in the nerves of the cranium, and is distributed to the greater part of the viscera.

The senses are always five in number. There are always two eyes, moveable at pleasure. The ear has always at least three semicircular canals. The sense of smell is always sconfinned to particular cavities in the fore part of the head.

The circulation is always performed by one fleshy ventricle at least; and where the ventricles are two in number, they are always close together, forming a single mass. The absorbent vessels are distinct from the sanguiferous veins.

The two jaws are always placed horizontally, and open from above downwards. The intestinal canal is continued without interruption, from the mouth to the anus, which is always placed behind the pelvis, that is, behind the circle of bones which affords a fixed point for the posterior extremities. The intestines are enveloped within a membranous

sac, termed peritonæum. There is always a liver and a pancreas, which pour their secretions into the cavity of the intestines; and there is always a spleen, within which part of the blood undergoes some preparatory change before it is sent to the liver.

There are always two kidneys for the secretion of urine, placed on the two sides of the spine, and without the peritonæum. The testicles also are always two in number. There are always two bodies, called atrabiliary capsules, placed over the kidneys; the use of them is unknown.

Animals with vertebræ are subdivided into two classes, one of which is warm-blooded, and the other cold-blooded.

Warm-blooded vertebrated animals have always two ventricles, and a double circulation. They respire by means of lungs, and cannot exist without respiration. The brain almost always fills the cavity of the cranium. The eyes are covered with eyelids. The tympanum of the ear is sunk within the cranium; the different parts of the labyrinth are completely inclosed within bone; and, besides the semicircular canals, the labyrinth contains the cochlea, with two *scala*, resembling the shell of the snail. The nostrils always communicate with the throat, and afford a passage for the air in respiration. The trunk is furnished with ribs, and almost all the species of this branch of animals have four limbs.

Cold-blooded vertebrated animals resemble one another more by their negative than their positive characters. Many of them are destitute of ribs; some of them are totally destitute of limbs. The brain never fills the whole cavity of the cranium. The eyes seldom have moveable eyelids. The tympanum of the ear, when present, is always close to the surface of the head; it is often absent, as are likewise the ossicula auditus; the cochlea is always wanting. The different parts of the ear are not firmly attached to the cranium; they are often loosely connected to it in the same cavity as the brain.

Each of these two branches is subdivided into two classes.

The two classes of warm-blooded animals are the MAMMALIA and BIRDS.

The MAMMALIA are viviparous, and suckle their young with milk secreted by the mammæ. The females have consequently always the cavity termed uterus, with two cornua, and the males have always a penis.

The head is supported on the first vertebræ by two eminences. The vertebræ of the neck are never less than six, nor more than nine. The brain has a more complicated structure than in other animals, and contains many parts which are not to be found in the other classes, such as the corpus callosum, fornix, pons, &c.

The eyes have two eyelids only. The ear contains four small bones, articulated together, and has a spiral cochlea. The tongue is quite soft and fleshy. The skin is covered entirely with hairs, in the greatest number, and in all it is covered partially.

The lungs fill the cavity of the chest, which is separated from the abdomen by a fleshy diaphragm.

There is one larynx only, situated at the basis of the tongue, and completely covered by the epiglottis, when the animal swallows.

The lower jaw only is moveable; both jaws are covered with lips.

The biliary and pancreatic ducts are inserted into the intestinal canal at the same place. The lacteal vessels convey a white milky chyle, and pass through a number of conglobate glands, situated at the mesentery. A membrane, called omentum, suspended from the stomach and adjacent viscera, covers the fore part of the intestines. The spleen is always upon the left side, between the stomach, ribs, and diaphragm.

Blumenbach establishes the following orders in this class:

Order I. BIMANUS, two-handed. Genus, Homo.

Order II. QUADRUMANA, four-handed animals: having a separate thumb capable of being opposed to the other fingers, both in their upper and lower extremities, teeth like those of man, except that the *cuspidati* are generally longer.—1. Simiæ, apes, monkeys, baboons.—2. Lemur, macaüco.

Order

Order III. **CHIROPTERA**.—The fingers of the fore feet, the thumb excepted, are, in these animals, longer than the whole body; and between them is stretched a thin membrane for flying. Hence they are as little capable of walking on the ground as apes, with their hands, or sloths, with their hooked claws, which are calculated for climbing.—1. Vespertilio, bat, calugo, &c.

Order IV. **DIGITATA**.—Mammifera, with separate toes, on all four feet. This order contains the greatest number of genera and species, and is therefore conveniently divided, according to the differences of the teeth, into three families, *glires*, *feræ*, and *bruta*.

(A) *Glires*.—With two chisel-shaped incisor teeth in each jaw, for the purpose of gnawing without canine teeth.—1. Sciurus, squirrel.—2. Glis, dormouse (*Myoxus*, Linn.)—3. Mus, mouse and rat.—4. Marmota, marmot.—5. Savia, guinea-pig.—6. Lepus, hare and rabbit.—7. Jaculus, jerboa.—8. Hystrix, porcupine.

(B) *Feræ*.—With pointed or angular front teeth, and mostly with only a single canine tooth on each side, which is generally, however, of remarkable size and strength. The carnivorous animals, properly so called, and some other genera with teeth of the same kind, compose this family.—1. Erinaceus, hedgehog.—2. Sorex, shrew.—3. Talpa, mole.—4. Didelphis marsupialis, opossum.—5. Viverræ, weasels, ferret, polecat, civet.—6. Mustela, stunk, stoat, &c.—7. Ursus, bear.—8. Canis, dog, wolf, jackall, fox, hyæna.—9. Felis, cat, lion, tiger, leopard, lynx, panther, &c.

The three first genera belong to the insectivora of Cuvier; their feet are short, and their power of motion weak. They have no cæcum, and, walking, they rest the whole of the foot on the ground. They live principally on insects, whence their name is derived. The fourth genus belongs to the marsupialia of Cuvier; the animals of this class have a pouch in the abdomen, which contains the mammæ, as well as the young in their early state. The remaining genera, with the exception of the bear, belong to the digitigrada of Cuvier.

(C) *Bruta*.—Without teeth, or at least without front teeth.—1. Bradypus, sloth.—2. Myrmecophaga, ant-eater.—3. Manis, scaly ant-eater.—4. Dasypus or Tatu, armadillo.

This order forms the edentata of Cuvier, the tongue is long, slender, and projectile, for seizing the insects on which the animals live. The armadillo, manis, ant-eater, and ornithorhynchus, or duck-billed animal, belong to this order.

Order V. **SOLIDUNGULA** (Solipeda, Cuv.)—A single toe on each foot, with an undivided hoof. Large intestines, and particularly an enormous cæcum. Incisors in both jaws.—1. Equus, horse or ass.

Order VI. **BISULCA** (Pecora).—These are the ruminantia of Cuvier, their hoof is divided. No incisors in the upper jaw. Stomach consisting of four cavities. Rumination of the food. Long intestines.—1. Camelus, camel, dromedary, lama.—2. Capra, sheep, goat.—3. Antelope, antelope, chamois.—4. Bos, ox, buffalo.—5. Giraffa, giraffe, or camelopard.—6. Cervus, elk, deer kind.—7. Moschus, musk.

Order VII. **MULTUNGULA** (Belluæ).—Animals of an unshapely form, and a tough and thick hide; whence they have been called by Cuvier, *pachydermata* (from *παχυς*, thick, and *δερμα*, skin). They have more than two toes; incisors in both jaws, and in some cases enormous tusks.—1. Sus, pig kind, pecari, babiroussa.—2. Tapir.—3. Elephas.—4. Rhinoceros.—5. Hippopotamus.

Order VIII. **PALMATA**.—Mammifera, with webbed feet, the genera being divided (as in the order Digitata) according to the forms of the teeth, into three families:

(A) *Glires*. (B) *Feræ*. (C) *Bruta*.

(A) *Glires*.—With chisel-shaped gnawing teeth.—Castor, beaver. (B) *Feræ*.—With the teeth of carnivorous animals.—Phoca, seal. (C) *Bruta*.—Without teeth, or at least without front teeth.—Ornithorhynchus, duck-billed animal.—Trichechus, walrus.

The last genus of the order, together with the phoca (seal), constitutes the amphibia of Cuvier. These animals have short members, adapted for swimming.

Order IX. **CETACEA**.—Whales living entirely in the sea, and formed like fishes; breathe by an opening at the top of the head, called the *blowing-hole*, through which they throw out the water, which enters their mouth with the food. Smooth skin, covering a thick layer of oily fat. No external ear. A complicated stomach. Multilobular kidneys; larynx of a pyramidal shape, opening towards the blowing-hole. Testes within the abdomen. Mammæ at the sides of the vulva. Bones of the anterior extremity concealed and united by the skin, so as to form a kind of fin.—1. Monodon, narwhale, sea-unicorn.—2. Balæna, proper whales.—3. Physter, macrocephalus, white whale.—4. Delphinus, dolphin, porpoise.

Cuvier distributes the class mammalia into three grand divisions:—

1. Those which have claws or nails, (*mammifères à ongles*) including the following orders: bimana, quadrimana, chiroptera, plantigrada, carnivora, pedimana, rodentia, edentata, tardigrada.

2. Those which have hoofs (*mammif. à ongles*) including the pachydermata, ruminantia, and solipeda.

3. Those which have extremities adapted for swimming (*mammif. à pieds en nageoire*). Amphibia and cetacea.

Class II. **BIRDS**.—Birds are oviparous. They have only one ovary and one oviduct, in which they differ from other oviparous animals. The head is supported on the first vertebra of the neck by a single eminence. The vertebra of the neck are very numerous, and the sternum very large. The anterior extremities are used for flying, and the posterior for walking.

The eyes have three eye-lids. There is no external ear; the tympanum contains only one bone, and the cochlea is a cone, slightly curved. The tongue has a bone internally. The body is covered with feathers. The lungs are attached to the ribs. The air passes through the lungs in its way to the air-bags, which are dispersed throughout the body. There is no diaphragm. The trachea has a larynx at each end, and the upper one has no epiglottis. The upper mouth consists of a horny bill without lips, teeth, or gums, and both mandibles are moveable.

The pancreas and liver send out several excretory ducts, which enter the intestines at different places. The chyle is transparent, and there are no mesenteric glands nor omentum. The spleen is in the centre of the mesentery. The ureters terminate in a cavity called the cloaca, which also affords an exit to the solid excrement and to the eggs. There is no urinary bladder.

Blumenbach divides them into two leading divisions.

Division (A).—**LAND BIRDS**.—Order I. **ACCIPITRES**.—Birds of prey, almost all with short strong feet, large sharp claws, and a strong hooked beak, which, for the most part, terminates above in two short cutting points, and is commonly covered at the root with a fleshy membrane. A membranous stomach, and short cæca.—1. Vultur, vultures.—2. Falco, falcon, eagle, hawk, kite.—3. Strix, owl.—4. Lanius, shrike or butcher-bird.

Order II. **LEVIROSTRES**.—Light-billed birds, having a large hollow bill.—1. Psittacus, parrot kind.—2. Ramphastus, toucan.—3. Buceros, rhinoceros bird.

Order III. **PICI**.—The birds of this order have short feet, and commonly a straight bill.—1. Picus, woodpecker.—2. Yunx, wryneck.—3. Sitta, nuthatch.—4. Alcedo, kingfisher.—5. Merops, bee-eater.—6. Upupa, hoopoe.—7. Certhio, creeper.—8. Trochilus, humming birds, &c. &c.

Order IV. **CORACES**.—The birds of this order have short feet, with a strong bill, convex on the upper part, and of moderate size.—1. Buphaga, ox-pecker.—2. Crotophaga, razor-billed blackbird.—3. Corvus, crow, raven, jackdaw, magpie, jay, &c.—4. Coracias, roller.—5. Gracula, minor grackle.—6. Paradisea, birds of paradise.—7. Cuculus, cuckoo.—8. Oriolus, oriole.

Order V. **PASSERES**.—Small singing birds, with short and slender feet, and conical sharp-pointed bills, of various size and form.—1. Alauda, lark.—2. Sturnus, starling.—3. Turdus, thrush, blackbird.—4. Ampelis, chatterer.—5. Loxia, cross-billed

cross-billed tribe.—6. Emberizo, bunting.—7. Fringilla, finches, canary-bird, linnæ, sparrow.—8. Musicapa, fly-catcher.—9. Motacilla, nightingale, redbreast, wren.—10. Pipra, manakin.—11. Parus, titmouse.—12. Hirundo, swallow, martins, &c.—13. Caprimulgus, goatsucker, &c.

Order VI. GALLINÆ.—Gallinaceous birds, mostly domesticated, have short legs with a convex bill, which is covered with a fleshy membrane at its base, and of which the upper half overlaps the lower on each side. They possess a large crop.—1. Colomba, pigeons.—2. Tetrao, grouse, quail, partridge.—3. Numida, guinea-fowl.—4. Phasianus, cock, pheasant.—5. Crax, curresso.—6. Meleagris, turkey.—7. Pavo, peacock.—8. Otis, bustard.

Order VII. STRUTHIONES.—Struthious birds. The largest of the class; possess extremely small wings, and are therefore incapable of flight; but run very swiftly.—1. Struthio, ostrich, cassowary.—2.—Didus, dodo.

Division (B) AQUATIC BIRDS.—Order I. GRALLÆ. These birds have cylindrical bills of various lengths; long stilt-like legs; long neck, and short tail. They mostly live in marshes, and feed on amphibia.—1. Phœnicopterus, flamingo.—2. Platalæa, spoonbill.—3. Palamedea, horned screamer.—4. Ardea, crane, stork, heron, bittern.—5. Tantalus, ibis, &c.—6. Scolopax, woodcock, snipe, curlew.—7. Tringa, lapwing, ruffs and reeves.—8. Charadrius, plover.—9. Hamatopus, sea-pie.—10. Fulica, water-hen, coot.—11. Parra, spur-winged water-hen.—12. Rallus, rail.—13. Psophia, trumpeter.

Order II. ANSERES.—Swimming birds; web-footed; the upper mandible mostly ends in a little hook, and, together with the lower, is in most instances plentifully supplied with nerves.—1. Rhincops, sea-crow.—2. Sterna, noddy, silver bird.—3. Colymbus, diver.—4. Larus, gull.—5. Plotus, darter.—6. Phæton, tropic bird.—7. Procellaria, petrel.—8. Diomedea, albatross.—9. Pelecanus, pelican, comorant.—10. Anas, swan, duck, goose.—11. Mergus, goosander.—12. Alca, auk, puffin.—13. Aptenodytes, penguin.

The two classes of cold-blooded vertebral animals are the AMPHIBIA AND FISHES.

The animals of the former class differ from one another in many very essential particulars, and have not so many characters in common as the other classes. Some of the reptiles walk, some fly, some swim, many can only creep. The organs of the senses, and particularly the ear, differ almost as much as the organs of motion; none of the reptiles, however, have a cochlea. The skin is either naked or covered with scales. The brain is always very small. The lungs are in the same cavity with the other viscera; there are no air-bags beyond the lungs, but the cells of these organs are very large. There is but one larynx, and no epiglottis. Both the jaws are moveable. There are neither mesenteric glands, nor omentum. The spleen is in the centre of the mesentery. The female has always two ovaria and two oviducts. There is a bladder.

The class of reptiles, in the arrangement of Cuvier, corresponds to the orders of reptiles pedati, and serpentes apodes, belonging to the class of amphibia in the *Systema Naturæ* of Linnæus.

Order I. REPTILIA, having four feet, (*quadrupeda ovipara*) the toes of which are, according to their mode of life, either separate, (*pedes digitati*) connected by membranes, (*palmati*) or confounded with one another in the form of a fin, (*pinnati*).—1. Testudo.—2. Rana.—3. Draco.—4. Lacerta.

Order II. SERPENTIA.—No external organs of motion; body of an elongated form, covered with scales, plates, or rings. Their slender, and for the most part cloven tongue serves them for tasting. Many are provided with an active venom, contained in little bags on the front of the upper jaw, secreted by particular glands, and conveyed into the wound made in biting by means of isolated teeth, which are tubular, with a longitudinal opening at the top. They are oviparous, but the egg is sometimes hatched in the oviduct. Both jaws moveable.—1. Crotalus, rattle-snake.—2. Boa. Immense

serpents of India and Africa.—3. Coluber, viper.—4. Anguis, blind-worm.—5. Amphisbæna.—6. Cæcilia.

FISHES respire by means of organs in the shape of combs, placed at the two sides of the neck, between which they force water to pass. They have, consequently, neither trachea, larynx, nor voice. The body is formed for swimming. Besides the four fins, which correspond to the limbs, they have vertical ones upon the back, under the tail, and at its extremity; but they are sometimes wanting.

The nostrils are not employed in respiration. The ear is quite hid within the craanium. The skin is naked, or covered with scales. The tongue is osseous. Both jaws are moveable. There are often cœca in place of the pancreas. There is a bladder and two ovaria.

The animals destitute of vertebræ have less in common, and form a less regular series than the vertebrated animals. But, when they have hard parts, these are generally placed on the outside of the body, at least when articulated; and the nervous system has not its middle part inclosed within a canal of bone, but loosely situated in the same cavity with the other viscera.

The brain is the only part of the nervous system which is placed above the alimentary canal. It sends out two branches, which encircle the œsophagus like a necklace, and which afterwards unite and form the common fasciculus of the nerves.

None of the animals without vertebræ respire by cellular lungs, and none of them have a voice. Their jaws are placed in all kinds of directions, and many of them have only organs of suction. None of them have kidneys, or secrete urine. Those among them which have articulated members, have always six at least.

Division (A) CARTILAGINOUS FISHES.—Order I. CHONDROPTERYGII; have no branchial operculum, and, in most, the mouth is placed on the under side of the head.—1. Petromyzon, lamprey.—2. Gastrobranchus, hag-fish.—3. Raia, ray, skate, torpedo, stingray.—4. Squalus, shark, saw-fish.—5. Lophius, sea-devil, frog-fish.—6. Balistes, file-fish.—7. Chimæra, sea-ape.

Order II. BRANCHIOSTEGI, with opercula to the gills.—1. Accipenser, sturgeon, beluga.—2. Ostracion, trunk-fish.—3. Tetradon, globe-fish.—4. Diodon, porcupine-fish.—5. Cyclopterus, lumpsucker.—6. Centricus, snipe-fish.—7. Syngnathus, pipe-fish.—8. Pegasus, sea-dragon.

Division (B) BONY FISHES, divided according to the situation of their fins. Order I. APODES, without ventral fins.—1. Muræna, eel-kind.—2. Gymnotus, electrical eel.—3. Trichiurus.—4. Annarrhichus, sea-wolf.—5. Ammodites, lance.—6. Ophidium.—7. Stromateus.—8. Xiphias, sword-fish.—9. Leptocephalus.

Order II. JUGULARES. Ventral fins in front of the thoracic.—1. Callionymus, dragonet.—2. Uranoscopus, stargazer.—3. Trachinus, sting-fish.—4. Gadus, haddock, cod, whiting, ling.—5. Blennius, eel-pout.

Order III. THORACICI. Ventral fins directly under the thoracic.—1. Cepola, ribbon-fish.—2. Echeneis, sucking-fish.—3. Coryphæna, dorado.—4. Gobius, Gudgeon.—5. Cottus, poggè.—6. Scorpæna.—7. Zeus, dory.—8. Pleuronectes, flounder, plaice, dab, halibut, sole, turbot.—9. Chætodon.—10. Sparus, gilthead, sea-bream.—11. Labrus, rainbow-fish.—12. Scizænæ.—13. Perca, perch.—14. Gasterosteus, stickleback.—15. Scomber, mackerel, bonito, tunny.—16. Mullus, mullet.—17. Trigla, flying-fish.

Order IV. ABDOMINALES. Ventral fins behind the thoracic; chiefly inhabit fresh water.—1. Cobitis, loach.—2. Silurus.—3. Loncaria, harness-fish.—4. Salmo, salmon, trout, smelt.—5. Fistularia.—6. Esox, pike.—7. Polypterus.—8. Elops.—9. Argentina.—10. Atherina.—11. Mugil.—12. Exocoetus.—13. Polynemus.—14. Clupea, herring, sprat, shad.—15. Cyprinus, carp, tench, gold-fish, minnow, &c. &c.

The invertebral animals were distributed by Linnæus into two classes, insects and worms (vermes). In this arrangement the insects of Linnæus are divided into crustacea and insecta; and the vermes of the same author form three classes, viz. mollusca, vermes, and zoophyta.

The INSECTS in their perfect state have, like the crustacea, articulated limbs and antennæ. Most of them have also membranous wings, which enable them to fly. All these last pass through several metamorphoses, in one of which they are quite destitute of the power of motion. All of them have a nervous system similar to that of the crustacea; but insects have neither heart nor blood-vessels, and respire by tracheæ. Not only the liver, but all the secreting organs are wanting, and their place is supplied by long vessels, which float loosely in the abdomen. The form of the intestinal canal is often very different in the same individual, in its three different states.

As the class of insects corresponds to the same class in the *Systema Naturæ*, (see *Natural History* in this work) with the exception of the two genera cancer and monocolus separated from it, in order to form the class of crustacea; it is unnecessary to transcribe here the different genera or orders.

The VERMES may be divided into two orders; the intestinal, which inhabit the bodies of other animals; and the external.

The former are not of such a complicated organization as the latter; so that they are sometimes arranged among the zoophytes. The external worms have a nervous chord possessing ganglia, an elongated body composed of rings; and having no distinct head. There are no members. Circulating vessels, but no heart. No nerves have been discovered in the intestinal worms.

The class of worms comprehends some of the genera arranged by Linnæus among the vermes intestina, such as the lumbricus, gordius, thrudo; some of the genera placed by the same naturalist among the vermes mollusca, such as the aphrodita, nereis, terebella, and lastly some genera included in his order of vermes testacea, such as the serpula dentalium.

Order I. INTESTINA.—1. Gordius, hair-worm.—2. Ascaris, thread-worm, round worm.—3. Trichocephalus.—4. Echinorhynchus.—5. Lumbricus, earth-worm.—6. Fasciola, fluke.—7. Tænia, tape-worm.—8. Hydatid, hydatid.—9. Sipunculus.—10. Hirudo, leech.

The class of mollusca comprehends the greater part of the animals which Linnæus has arranged in the two orders of mollusca and testacea, in the class of vermes; such as the sepia, limax, ascidia, helix, ostrea, patella, pholas, teredo, &c.

The body of the mollusca is fleshy, soft, and without articulated members, though sometimes containing hard parts internally, and sometimes covered completely by hard shells. They have arterial and venous vessels, within which the blood undergoes a true circulation.

They respire by branchiæ. The brain is a distinct mass, from which the nerves and medulla oblongata proceed. There are ganglia in different parts of the body.

The internal senses vary as to their number. Some of the mollusca have the organs of sight and hearing quite distinct, while others seem to be confined to the senses of touch and taste. Many of them can masticate their food; others have the power of swallowing only.

They have a very large liver, which affords a great quantity of bile. The organs of generation vary extremely.

Order II. MOLLUSCA.—1. Limax, slug.—2. Aplysia.—3. Doris.—4. Glaucus.—5. Aphrodita, sea-mouse.—6. Amphitrite.—7. Nereis.—8. Nais.—9. Ascidia.—10. Actinia.—11. Tethys.—12. Holothuria.—13. Thalia.—14. Terebella.—15. Lernæa.—16. Scyllæa.—17. Clio.—18. Sepia, cuttle-fish.—19. Medusa, sea-blubber.

Order III. TESTACEA.—These animals very much resemble the worms of the preceding order.—1. Chiton.—2. Lepas, acorn-shell.—3. Pholas, pierce-stone.—4. Mya, muscle.—5. Solen, razor-shell.—6. Tellina.—7. Cardium, cockle.—8. Mactra.—9. Donax.—10. Venus.—11. Spondylus.—12. Chama.—13. Arca, ark.—14. Ostrea, oyster.—15. Anomia.—16. Mytilus, muscle.—17. Pinna, sea-wing.—18. Argonauta, paper-sailor.—19. Nautilus.—20. Conus.—21. Cypræa.—22. Bulla, dipper.—23. Voluta, rhomb-shell.—24. Buccinum, whelk.—25. Strombus, screw.—26. Murex, rock-shell.—27. Trochus, top-shell.—28. Turbo, whirl-

wreath.—29. Helix, snail.—30. Merita.—31. Haliotis, sea-ear.—32. Patella, limpet.—33. Dentalium, tooth-shell.—34. Serpula, worm-shell.—35. Teredo.

Order IV. CRUSTACEA.—The body is covered with a hard crust in separate pieces. There are articulated limbs, which are often very numerous. The nervous system consists of a long, knotted cord, from the ganglia of which proceed all the nerves.

The eyes are compound, hard, moveable. The ears are very imperfect. For the sense of touch, the crustacea have antennæ and palpi, like insects. They have a heart, arterial and venous vessels, and branchiæ for respiration. The jaws are transverse, strong, and numerous. The stomach has teeth within. The numerous cœca afford a brown liquor, which seems to be in the place of bile. The penis is double, and there are two ovaria.—1. Echinus, sea-hedgehog.—2. Asterias, sea-stars.—3. Encrinurus.

Order V. CORALLIA.—They inhabit certain immovable dwellings which, in most cases, are of a stony consistence, and are called corals.—1. Tubipora.—2. Madrepora.—3. Millepora.—4. Cellepora.—5. Isis.—6. Gorgonia.—7. Alcyonium, animal hydra.—8. Spongia.—9. Flustra.—10. Tubularia.—11. Corallina.—12. Sertularia.—13. Cellularia.

Order VI. ZOOPHYTA.—The class of Zoophytes correspond to the Zoophyta and lythopyta of Linnæus, but also include some of the vermes mollusca, such as the echinus, asterias, holothuria, actinia, medusa, together with the genus sipunculus from the vermes intestina.—1. Pennatulæ.—2. Hydra.—3. Brachionus, blossom-polype.—4. Vorticella.—5. Furcularia, wheel animal.—6. Vibrio.—7. Volvox.—8. Chaos.

Outline of Cuvier's classification of Animals; with Examples of Species belonging to each Division.

Class I. VERTEBRATA.—Order 1. MAMMALIA.—Bimana, man.—Quadrumana, monkey, ape, lemur.—Cheiroptera, bat, colugo.—Insectivora, hedgehog, shrew, mole.—Plantigrada, bear, badger, glutton.—Digitigrada, dog, lion, cat, martin, weasel, otter.—Amphibia, seal, walrus.—Marsupialia, opossum, kangaroo.—Rodentia, beaver, rat, squirrel, porcupine, horse.—Edentata, sloth, armadillo, ant-eater, pangolin.—Pachydermata, elephant, hog, rhinoceros, tapir, horse.—Ruminantia, camel, musk, deer, giraffe, antelope, goat, sheep, ox.—Cetacea, dolphin, whale.

Order 2. AVES.—Accipitres, vulture, eagle, owl.—Passeres, thrush, swallow, lark, crow, sparrow, wren.—Scansores, woodpecker, cuckoo, toucan, parrot.—Gallinæ, peacock, pheasant, grouse, pigeon.—Grallæ, plover, stork, snipe, ibis, flamingo.—Palmipedes, auk, grebe, gull, pelican, swan, duck.

Order 3. REPTILIA.—Chelonia, tortoise, turtle.—Sauria, crocodile, lizard, chameleon.—Ophidia, serpents, boa, viper.—Batrachia, frog, salamander, proteus, siren.

Order 4. PISCES.—Chondropterygii, lamprey, shark, ray, sturgeon.—Plectognathi, sun-fish, trunk-fish.—Lophobranchi, pipe-fish, pegasus.—Malacopterygii, salmon, herring, pike, carp, silurus, cod, sole, remora, eel.—Acanthopterygii, perch, mackerel, sword-fish.

Class II. MOLLUSCA.—Cephalopoda, sepia, nautilus.—Pteropoda, clio, hyalæa.—Gasteropoda, slug, snail, limpet.—Acephala, oyster, muscle, ascidia, pyrosoma.—Brachiopoda, lingula, terebratulæ.—Cirrhopoda, barnacle.

Class III. ARTICULATA.—Order 1. ANNELIDES, or VERMES.—Tubicolæ, serpula, sabella.—Dorsibranchiæ, nereis, aphrodite.—Abranchiæ, earth-worm, leech.

Order 2. CRUSTACEA.—Decapoda, crab, lobster, prawn.—Stomopoda, squill.—Amphipoda, gammarus.—Isopoda, asellus.—Brachiopoda, monocolus.

Order 3. ARACHNIDA.—Pulmonalia, spider, scorpion.—Trachealia, phalangium, mite.

Order 4. INSECTA.—Aptera, centipede, podura.—Coleoptera, beetle, glow-worm.—Orthoptera, grasshopper, locust.—Hemiptera, fire-fly, aphid.—Neuroptera, dragon-fly, ephe-mera.—Hymenoptera, bee, wasp, ant.—Lepidoptera, butter-fly,

fly, moth.—Rhipiptera, xenos, stylops.—Diptera, gnat, house-fly.

Class IV. ΖΟΟΡΗΥΤΑ.—Echinodermata, star-fish, echinus.—Entozoa, fluke, tænia, hydatid.—Acalephæ, actinia, medusa.—Polypi, hydra, coralline, pennatula, sponge.—Infusoria, brachionus, vibrio, proteus, monas.

In the remainder of this article, we have to furnish an account of the anatomy of the animals previously spoken of. Two roads lay open to us: one to commence with an analysis of each genus or species, a mode very complete and desirable; the other to give merely such an account of the leading systems, in the different orders, as may best illustrate the general differences. This incomplete sort of exposition, is what is usually adopted by writers on General Zoology, and this our limits compel us to adopt. We shall now proceed to give an account of

THE SYSTEMS OF REPAIR AND WASTE IN GENERAL:
viz. the Digestive, Circulating, Respiratory, Urinary, Cutaneous, and Generative.

In the class *vermes*, the stomach presents many varieties. In general, it is a mere membranous bag; but in the aphrodite aculeata, in the helix stagnalis, and the orchidia, its muscular structure is developed so as to make it a sort of gizzard. Again, the œsophagus in many of the testacea is furnished with hard processes, which serve to triturate the food. In the cuttle fish, for example, there are two teeth, or rather jaws, in the œsophagus; the bulla lignaria has three, so powerful as to crush very strong shells; the stomach of the chiton cinereus is studded with small grinders; the triconia has two jaws, which act like scissors; the leech has three semicircular cutting plates, just within the mouth.

The size, the form, and the connexions of all these parts, vary considerably; and the teeth above mentioned, are periodically shed, like the cutaneous scales or feathers of the higher animals.

The intestines vary in the *vermes*, as much as the stomach. In the ascaris lumbricoides it is merely a canal, nearly straight, that runs from the stomach to the anus; in the hirudo, the intestines contract towards their termination, and end in an anus so minute, that some, (Dumeril amongst others) have denied its existence altogether; in the aphrodite aculeata, as well as in several other *vermes*, the intestine has several blind pouches of considerable dimensions, entering it on different sides; these, Zoologists have described, as furnishing peculiar secretions, or forming receptacles for the aliment; they perform, probably, both these functions. It is curious that in all the acephalous mollusca, the intestine passes through the heart.

In the annexed engravings are specimens of these parts.

Fig. 1.—*a a*, the two larger horns of the helix pomatia; *b b*, the smaller horns; *c*, the mouth; *d*, the opening (visible only during the rutting season) out of which the generative organs unfold themselves; *e*, the limbus, a thick border, which adheres to the edge of the shell, having two orifices; one, *g*, for the passage of air, the other, *f*, for the reception of air; *h*, the foot of the animal, which, being protruded from the shell before and behind, serves for locomotion; *l l*, the body of the animal; *n*, the situation occupied by the heart.

At fig. 2 is seen the alimentary canal of this helix; *c*, the stomach; *d*, the pylorus; *b*, the small intestines which, having made several turns corresponding with the body, end in the rectum, at *d*; the anus, *e*, is, as before shewn, on the side of the border that unites the animal to the edge of this shell. The liver is situated in the midst of the small intestines; at *e*, is the part where the bile is poured into the intestines. At fig. 3 are seen the same parts from the other side, *a* marking the liver, *b* the intestines, *c* the rectum, and *d* the stomach.

In the *insecta* we have the same kinds and varieties in the stomach and intestines as in the preceding order.—In the earwig we have rows of teeth round the upper orifice of the stomach, and in many species of cancer bony processes in the stomach, which are annually re-produced. Amongst other curious deviations, it may be mentioned that the grass-

hopper has the œsophagus larger than the stomach; and that one species (the gryllus gryllotalpa) has the stomach divided into three or four cavities, which have been compared with the stomachs of the ruminating animals.

In some, as in the crustacea, the canal takes a direct course from the mouth to the anus, and is only enlarged at the stomach. The orthoptera, on the other hand, have a long, and complicated digestive apparatus; first, a membranous stomach, then one that is muscular and toothed, thirdly some cœcal processes, and fourthly an intestine of various length and calibre. As an universal rule, it is found that animals of the same order, living on animals, have a shorter alimentary canal than those which live on vegetable matter; but there is a great connexion between the size of the canal and the voracity of the animal. Thus the larvæ of the scarabæus and the butterfly have intestines ten times as large as they have when they become winged insects.

The simplest form of the alimentary canal in the *insecta* is seen at fig. 6, which is the stomach and intestines in the ephemera.

The œsophagus passes like a thread to the entrance of the stomach *a*; *c*, the stomach, with the trachæa ramifying upon it; *b*, its superior opening; *d*, the small intestine; *e*, the large; *f*, the rectum. The stomach is placed close to the back, and within the fourth and fifth rings of the body.

As another example of the anatomy of the alimentary canal in the *insecta*, we have taken the louse. Fig. 5 is a representation of the stomach and intestines of this insect, in which the mouth, *a*, is an opening, so small that it can rarely be detected; but its existence may readily be demonstrated by examining the insect while he is sucking blood; for, from the transparency of its parietes, this fluid is seen passing into the mouth with a velocity, which, Swammerdam says, "is enough to frighten the observer." The mouth is seated at the extremity of a proboscis, and is moveable therein; its extreme sharpness enables it to penetrate the human skin very readily. The proboscis is armed with sharp claws, which bury themselves readily in the skin, and serve to hold the mouth immoveable when insinuated into the insect's prey.

The œsophagus lines the whole length of the proboscis, and terminates in the stomach. It is situated at *x*, behind the eyes, passes over the brain, forms a small swelling in the neck, *g*, contracts itself considerably immediately afterwards, *h*, and finally enters into the stomach by an opening, of a diameter so small, that it is never visible except while the animal is sucking. At *i i*, we observe the stomach partly contained in the thorax and loins, but chiefly in the abdomen, while in the chest it has entering into it two blind pouches, *k k*, which are extended on each side of the œsophagus and medulla spinalis, even to the first pair of feet. In the abdomen the stomach is in form an elongated sac, and is remarkable for the amazingly extended and powerful contractions it exhibits, as well as for the thick manner in which it is studded with trachææ, *l l l*; and these trachææ have been considered by some as furnishing, by their alternately swelling and contracting, the intestinal movement of the alimentary canal. A small body, *m*, of irregular size and, in different insects, extremely variable figure, is found in the abdomen, just beneath the stomach; it furnishes a secretion to the alimentary canal, and thus answers to the liver or pancreas of the higher animals, or perhaps to both. At the extremity of the stomach we have the pylorus, *n*, followed by the small intestine, *o o*, which is much convoluted, and, like the stomach, thickly covered with the racemes of the trachææ. Four large vessels enter it at *p p p p*, to which Malpighi gave the indeterminate name of *varicose vessels* but which Swammerdam shewed to be cœca. Soon after these the colon becomes visible at *q*. A large dilatation at *r* may be considered as the cloaca, terminating in the rectum, *s*, at the extremity of which is the anus, *t*, that opens under the belly of the insect at the bifurcation of the tail.

The preceding may, in some measure, be contrasted with a representation of the same parts in the bee, at fig. 10.

The œsophagus, *a*, fig. 10, is very thin, and the stomach, *b*, is membranous and thin; it is fortified by fleshy fibres, and is generally found full of honey, which is easily recognised by

its taste. We may readily distinguish the pylorus, *c*, and beneath we perceive a part a little more protuberant, of an orange colour. Next we see the intestine, *d d*, somewhat resembling a colon; it is much thicker than the stomach, especially when it is full; it has also strong muscular fibres, which form it into folds, and therefore valves. When in action, this intestine becomes very thin, and contracts considerably. In examining the commencement of this contraction, we discover a great number of little white threads, *e e e*; these threads, which resemble small intestines, are attached to the colon throughout its whole length, but particularly at the part *f*, where the contraction begins; this connexion is very strong, and is made, by means of the trachea, which are distributed through the whole body, but chiefly here. This intestine, after the contraction, of which we have spoken, dilates itself again at *g*, when it becomes entirely membranous; as it is transparent, it allows us to see some oblong white particles, *h*, traversing its whole substance. If we open the intestine, we find that they are glandulous bodies, six in number, which are raised in a remarkable manner on the internal surface of the intestine. The colon contracts itself once more at the part *i*, where it finishes, then the intestinum rectum, *l*, is met with, which terminates at the anus, immediately beneath the sting.

In *fishes*, the alimentary canal is generally short; sometimes, as in the petromyzon marinus, it runs straight from the œsophagus to the anus. The œsophagus is of great width, generally on account of the necessity that exists for this order of animals swallowing large substances, as they do not masticate. The enlargement of the stomach is very often so little, that this cannot be distinguished from the gullet. In the tetradon hispidus the stomach is so large, and of so elastic a structure, that the fish can change itself from a long to a round shape, by distending it with air. Ordinarily, the coats of the stomach are thin; but there are not wanting fishes that have it very thick and muscular. The intestines are of various lengths, generally short; but they are sometimes enlarged by a spiral valve, and nearly always by the appendices pyloricæ, which Blumenbach thus describes:—

“The appendices pyloricæ (which are found in all fishes, with a very few exceptions, as the *pike*) sometimes open at the lower orifice of the stomach, but generally at the commencement of the intestinal canal, and secrete a fluid, which seems to have considerable influence on the business of digestion and chyliification, which is performed in these animals in a very short time. They have generally the appearance of small blind appendices, and their number varies in the different species, from one to several hundred. In some cartilaginous fishes they are, as it were, consolidated into a glandular body, which has been compared to the pancreas of warm-blooded animals.”

These appendices have been supposed to perform the same office as the liver in the superior orders; but this opinion is erroneous, since they co-exist with that organ: but the glandular structure of their parietes, renders it certain that they are the repositories of some secretion.

The letters *c, d, e, f, g, h*, in fig. 26, mark the course of the alimentary canal in the *squalus maximus*.

The alimentary canal of the conger eel is seen at fig. 28.

In the *amphibia* we do not find any very remarkable change in the alimentary canal. Snakes have an œsophagus larger and still more elastic than fishes, and a stomach of the same dimensions—generally a short intestine. In the coluber natrix this is not equal to the length of the animal; but its dimensions are enlarged by a fallopian valve, formed by the projection of the lesser intestine into the greater. The capacious size of the œsophagus enables these serpents to swallow, as we have elsewhere mentioned, animals of larger bulk than their own bodies; and it is curious to observe how the part of their prey that is within the stomach is digested, while the rest remains sticking in the œsophagus unchanged.

The turtle's œsophagus is capacious, and is beset with numerous white pointed processes, which, Blumenbach con-

jectures, serve to prevent the return of the food. The testudo caretta has an internal canal, five times as large as his body; and in this, as in other species, the surface of the mucous membrane of the intestines is much extended by a multitude of thin longitudinal processes, which become fewer as the intestine descends.

In the crocodile the most remarkable points in the alimentary canal, are the funnel-like shape of the œsophagus, and the thickness and muscularity of the stomach.

At fig. 19, we have a view of the alimentary canal in frogs, *in situ*; *p*, the stomach and intestine; *q*, the liver; *r*, the gall-bladder.

Of the alimentary canal in *birds*.—The chief peculiarity of the alimentary canal in this order, are—1st. The crop, a dilatation of the œsophagus just before the sternum, furnished with numerous glands. 2d. A dilatation surrounded by glands, which is called the bulbus glandulosus, or, by Cuvier, the ventricule succenturié. 3d. The amazing thickness and muscularity of the stomach, constituting this viscus a gizzard. 4th. The existence of two cæca. These peculiarities are general, but not universal; for the crop exists in land-birds only—the piscivorous fishes having an œsophagus so large and elastic, that the cavity can be dispensed with; the stomach is, in those birds who live on insects, only a thin membranous bag; and some few aquatic birds have but one cæcum, and several predatory birds none.

The termination of the rectum in a cloaca, or common receptacle for the ureters, the generative organs, and the aperture of a membranous mucus-secreting bag, called bursa Fabricii, are peculiarities always met with.

At the entrance of the alimentary canal in birds, a number of small mucous glands are generally found that facilitate deglutition, and defend the membrane. In the ostrich two of these are so large that they appear like tonsils. These, however, bear no analogy to those salivary glands of the higher animals; for as there is no trituration performed in the mouth of birds, parts for the secretion of a solvent fluid would be clearly misplaced.

A throat-sac is also met with in some birds; this is a dilatation of the lining of the mouth between the lower jaw. It is most remarkable in the pelican, which has it large enough to contain several quarts of water and the fishes that form its prey. The buzzard has one of a somewhat different kind in the front of the throat, which opens by a large orifice at the root of the tongue.

It is to be remarked, that considerable varieties in size and form, are met with in the parts previously described. These we cannot better illustrate, than by extracting from the notes, appended by Messrs. Lawrence and Coulson to Blumenbach's “Manuel of Comp. Anat.,” the following observations:—“The solvent glands in birds are larger, and more distinct from the other parts of the digestive organs than in the mammalia. The solvent glands in the whole of the extensive genus falco, of Linnæus, are cylindrical bodies, with very small canals, a villous internal surface, and thick coats, open at one end, closed and rounded off at the other; they are placed on the outside of the membrane which lines the cardiac cavity, they lie parallel to one another, and nearly at right angles to the membrane through which they open, the closed end being slightly turned upwards, so as to make the orifice the most depending part. In the golden eagle (the falco chrysaëtos, L.) and the sea eagle (falco ossifragus,) they form altogether a broad compact belt; but in the hawk (falco nisus) this belt is slightly divided into four distinct portions; immediately below these glands the cavity becomes wider, and is enclosed in a digastric muscle of weak power, with a flat tendon on each side. The internal surface of this cavity, which is the gizzard, is soft and vascular.

“In all animals that live on animal food, the solvent glands appear to have a similar structure to that which has been just described, only differing in size and situation. In the solan goose (pelecanus bassanus) these glands are rather larger than in the eagle, but are placed in the dilated part of the cavity of the gizzard, forming a complete belt of great breadth, consequently are extremely numerous.

“In

"In the heron (*ardea cinerea*) they are in the same situation as in the solan goose; they are thinly scattered, and do not form a complete belt, being more numerous on the anterior and posterior surfaces. A ball of fish-bones, held together by mucus, was found in the cavity of the gizzard.

"In the cormorant (*pelecanus carbo*) the situation of the solvent glands is the same as in the solan goose; but they only form two circular spots, one anterior, the other posterior.

"In birds that live upon fish and sea insects with crustaceous coverings, as the sea-gull (*larus canus*), the gizzard has a horny cuticular lining, and the solvent glands are in the same situation as in the genus *falco*.

"In those birds that live on land insects, some of whose coverings are soft, others hard, there is a difference in the structure of the digestive organs from what has been described. The solvent glands are placed in a triangular form in the cardiac cavity, and immediately under it is a small gizzard with a horny lining. Of this kind is the woodpecker (*picus minor*).

"There is still another variety in the structure of these organs. In the little auk (*the alca alle*) the solvent glands are spread over a greater extent of surface than in any other bird that lives on animal food, and the form of the digestive organs is peculiar to itself. The cardiac cavity appears to be a direct continuation of the oesophagus, distinguished from it by the termination of the cuticular lining, and the appearance of the solvent glands. The cavity is continued down with very gradual enlargement below the liver, and is then bent up to the right side, and terminates in a gizzard; when the cavity is laid open, the solvent glands are seen at its upper part, every where surrounding it, but lower down they lie principally upon the posterior surface, and where it is bent upwards, towards the right side, they are entirely wanting. The gizzard has a portion of its anterior and posterior surfaces opposite each other, covered with horny cuticle.

"In birds that live principally on vegetable food, the solvent glands have a different structure, according to the substances the birds are intended to feed upon, and vary in situation according to the habits of life."

These facts are illustrated by the annexed figures; fig. 12 shews the gizzard of the swan, laid open to expose the internal structure. The grinding surfaces have an oval form, and each of them is made up of a ridge and hollow, which are adapted to the opposite side, the ridge of one fitting into the hollow of the other. Reduced to one fourth of the natural size.

Of the alimentary canal in the Mammalia.—The salivary glands of the mammalia exhibit very few variations in structure. They are small in the carnivora, as mastication, properly so called, can hardly be said to take place in them. On the contrary, the ruminantia and solipeda have them very large. The size of the sub-maxillary gland, in particular, is remarkable in the cow and sheep: it extends along the side of the larynx, quite to the back of the pharynx.

The parotid and sublingual glands do not exist in the amphibious mammalia, as the seal: the teeth of that animal are only adapted for seizing their prey, and must be utterly incapable of mastication. The same remark may be made on the cetacea, where the salivary system seems to be altogether deficient.

The mucous glands, which constitute the labiales and buccales of man, are larger and more distinct in some animals. There is a row of these opposite to the molar teeth of the dog and cat, penetrating the membrane of the mouth by several small openings. There is also a considerable gland in the dog, under the zygoma, and covered by the masseter. Its duct, equal in size to that of the parotid, or sub-maxillary glands, opens at the posterior extremity of the alveolar margin of the upper jaw. The molar glands and their openings are very conspicuous in the pig: The cow and sheep have an assemblage of similar glands in the zygomatic fossa: their excretory ducts open behind the last superior molar tooth.

No mammalia possess an uvula, except man and the simiæ.

VOL. XXIV. No. 1676.

As the cetacea possess no nostrils, they have not of course any velum palati.

The parts about the pharynx in the cetacea exhibit a very singular structure. The larynx is elongated, so as to form a pyramidal projection, on the apex of which its opening is found. The projection of this part will divide the pharynx; and the food must pass on either side of the pyramid. A muscular canal extends from the pharynx to the blowing holes, and is attached to the margin of those apertures. The circular fibres of this tube form a sphincter muscle; which, by contracting round the pyramid, cuts off the communication between the blowing holes and the mouth and pharynx.

The oesophagus of quadrupeds is distinguished from that of the human subject by possessing two rows of muscular fibres, which pursue a spiral course and decussate each other. In those carnivorous animals which swallow voraciously, as the wolf, it is very large; on the contrary, in many of the larger herbivora, and particularly in such as ruminant, its coats are proportionally stronger.

The opening of the oesophagus into the stomach is marked by some differences, both with regard to its size, and to the mode of termination. We understand, from observing these points, why some animals, as the dog, vomit very easily, while others, as the horse, are scarcely susceptible of this process, except in extremely rare instances.

It seems extraordinary, on the first consideration, that the ruminating animals, in whom the passage of the food from the first stomach into the oesophagus is very easy, should not be excited to vomit without such difficulty.

The form, structure, and functions of the stomach, are subject to great variety in this class of animals. In most carnivorous quadrupeds, particularly those of a rapacious nature, it bears a considerable resemblance, on the whole, to that of the human subject; its form, however, differs in some cases, as in the seal (*phoca vitulina*), where the oesophagus enters directly at the left extremity, so that there is no blind sac formed in the stomach.

The truly carnivorous stomach, as well as the human, which in its structure is closely allied to it, is, according to Sir E. Home, capable of dividing its cavity into two distinct portions by a transverse contraction of its coats, in which state the cardiac portion is, in length, two thirds of the whole, but, in capacity, much greater, and in several instances, where the opportunity was afforded of examining the part immediately after death, the stomach has been found in this form both in the human body and other animals. This appearance corresponds with the permanent form of the stomach of many other animals.

In some herbivora the stomach has a uniform appearance externally; but it is divided into two portions internally, either by a remarkable difference in the two halves of its internal coat, as in the horse, or by a valvular elongation of this membrane, as in several animals of the mouse kind. This is also the case in the hare and rabbit, where also the food in the two halves of the stomach differs very much in appearance, particularly if the animal has been fed about two hours before death.

The reader may refer to the plates, where fig. 13 indicates a hare's stomach that has the appearance before described; *a*, the oesophagus; *b b*, the cardiac portion of the stomach; *d*, the pyloric; *c*, a muscular band separating them; *e*, gastric glands; *f*, pylorus; *g*, duodenum.

In the animals alluded to in this paragraph the left half of the stomach is covered with cuticle, while the other portion has the usual villous and secreting surface. The cuticular covering forms a more or less prominent ridge at its termination. The left portion of the cavity may be regarded as a reservoir, from which the food is transmitted to the true digestive organ; and the different states in which the food is found in the two parts of the cavity justify the supposition. Hence these stomachs form a connecting link between those of ruminating animals on one side, and such as have the whole surface villous on the other.

In some other mammalia, particularly the herbivorous ones, this

this organ consists of two or more portions manifestly distinct externally, and forming as many stomachs. There are two of these in the hamster, three in the kangaroo and tajaçu, four in the sloths.

The carnivorous cetacea have also a complicated stomach, consisting in some species of three, in others of four, and even of five subdivisions.

The most complicated and artificial arrangement, both with respect to structure and mechanism, is found in the well known four stomachs of the ruminating animals with divided hoods; of this we shall take as examples, the cow and sheep.

The first stomach, or paunch, (rumen, penula, magnus venter, ingluvies; Fr. le double, l'herbier, la panse,) is by far the largest in the adult animal; not so, however, in the recently born calf or lamb. It is divided externally into two saccular appendices at its extremity, and it is slightly separated into four parts on the inside. Its internal coat is beset with innumerable flattened papillæ.

The second stomach, honeycomb bag, bonnet, or king's-hood, (reticulum arsineum, oltula; Fr. le bonnet, le réseau,) may be regarded as a globular appendage of the paunch; and is distinguished from the latter part by the elegant arrangement of its internal coat, which forms polygonal and acute-angled cells, or superficial cavities.

The third stomach, which is the smallest, is called the manyplus, which is a corruption of manyplies, (echinus, concave, centipellio, omasum; Fr. le feuillet, le pseautier); it is distinguished from the two former, both by its form, which has been compared to that of a hedge-hog when rolled up, and by its internal structure. Its cavity is much contracted by numerous and broad duplicatures of the internal coat, which lie lengthwise, vary in breadth in a regular alternate order, and amount to about forty in the sheep, and one hundred in the cow.

The fourth, or the red, (abomasum, faliscus, ventriculus intestinalis; Fr. la caillette,) is next in size to the paunch, of an elongated pyriform shape, with an internal villous coat like that of the human stomach, with large longitudinal folds.

The three first stomachs are connected with each other, and with a groove-like continuation of the œsophagus, in a very remarkable way. The latter tube enters just where the three first stomachs approach each other; it is then continued with the groove, which ends in the third stomach. This groove is therefore open to the first stomachs, which lie to its right and left. But the thick prominent lips, which form the margin of the groove, admit of being drawn together so as to form a complete canal, which then constitutes a direct continuation of the œsophagus into the third stomach.

The functions of this very singular part will vary, according as we consider it in the state of a groove, or of a closed canal. In the first case, the grass, &c. is passed, after a very slight degree of mastication, into the paunch, as into a reservoir. Thence it goes in small portions into the second stomach, from which, after a further maceration, it is propelled, by a kind of antiperistaltic motion, into the œsophagus, and thus returns into the mouth. It is here ruminated, and again swallowed, when the groove is shut, and the morsel of food, after this second mastication, is thereby conducted directly into the third stomach. During the short time which it probably stays in this situation between the folds of the internal coat, it is still further prepared for digestion, which process is completed in the fourth, or true digestive stomach.

Fig. 14 is a longitudinal section of the first cavity of the bullock's stomach, which is made up of two compartments, separated from each other by two strong transverse ridges, composed of a mixture of ligamentous and muscular fibres; also shewing the opening into the second cavity, a part of that cavity, the orifice leading into the third, and the canal from which the food is thrown up from the second cavity into the mouth, before it is conveyed into the third: *a*, the œsophagus, terminating in the first cavity of the stomach; *b b b b*,

the cavity itself exposed; *c c*, the two ridges, dividing it into two compartments; *d d*, orifice of the second cavity; *e*, the passage leading to the third cavity; *f f*, two muscular bands, which have their origin from the coats of the first cavity, and terminate in the orifice of the third, forming a canal, along which the food is conveyed from the second cavity to the mouth, and from the mouth to the third cavity.

Fig. 15 is a posterior view of the first and second cavities of the bullock's stomach unopened, and an internal view of the third and fourth, in their natural relative situation to the others: *a*, the œsophagus; *b b*, the coats of the first cavity, in a distended state; *c*, the coats of the second cavity; *d*, the orifice leading into the third cavity; *e e e*, the plicæ, of three different breadths, which are contained in the third cavity; *f*, the valvular termination of the third cavity in the fourth; *g g g*, the longitudinal plicæ of the fourth cavity; *h*, the rugæ of the fourth cavity, near the pylorus; *i*, the glandular projection opposed to the orifice of the pylorus; *k*, the pylorus, or termination of the fourth cavity;—on a scale of one inch to a foot.

There are still two peculiarities in the stomachs of some mammalia, which must be mentioned here, before we proceed to consider that of birds.

In the opossum, the two openings of the stomach are placed as near, or even nearer together, than in many birds, contrary to the usual rule in this class of animals.

There is a peculiar glandular body at the upper orifice of the beaver's stomach, about the size of a shilling, full of cavities that secrete mucus. It resembles, on the whole, the bulbous glandulosus of birds, and assists in the digestion and animalization of the dry food which this curious animal takes, consisting chiefly of the bark and chips of trees, &c.

The stomach of the pangolin (*manis pentadactyla*) is almost as thick and muscular as that of the gallinaceous fowls, and contains, like that of granivorous birds, small stones and gravel, which are probably swallowed for the same purpose as in the case of those birds.

According to Cuvier, there is a gland, as large as the head of a man, situated between the coats of the stomach, in the manati (*trichechus manatus borealis*). It is placed near the œsophagus, and discharges, on pressure, a fluid like that of the pancreas, by numerous small openings.

The stomach of the ornithorhynchus *hystrix* is covered with cuticle, and possesses sharp, horny papillæ, near the pylorus.

The peculiar structure of the stomachs of the kangaroo, camel, and lama, deserves a detailed examination. The stomach of the kangaroo differs in many particulars from that of any other known animal, and bears a greater resemblance to the human cœcum and colon than to any stomach. The œsophagus enters the stomach very near its left extremity, which, unlike the corresponding part in other animals, is very small and bifid. From the entrance of the œsophagus, the cavity extends towards the right side of the body, then passes upwards, makes a turn upon itself, crosses over to the left side before the œsophagus, and again crosses the abdomen towards the right, making a complete circle round the portion into which the œsophagus enters, and terminates by a contracted orifice at the pylorus.

Its cavity gradually enlarges from the left extremity through its whole course, till it approaches the pylorus; it then contracts and dilates again into a rounded cavity, with two lateral processes: beyond this is the pylorus, the orifice of which is very small. On the anterior and posterior side of the stomach, there is a longitudinal band, similar to those of the human colon, beginning faintly at the left termination, and extending as far as the enlargement near the pylorus; these bands being shorter than the coats of the stomach, the latter are consequently puckered, forming sacculi, as in the human colon.

When the cavity of the stomach is laid open, the cuticular lining of the œsophagus is found to be continued over the portion immediately below it, and extends to the termination of the smallest process at the left extremity, and nearly to the

the same distance in the opposite direction; the cuticular covering is very thin, and extremely smooth.

The lining of the larger process, at the left extremity, is thick and glandular, and, in the living body, probably receives no part of the food, but is to be considered as a glandular appendage.

On the right of the œsophagus the cuticle does not end by a transverse line, but terminates, first, upon the middle of the great curvature, where a villous surface begins by a point, and gradually increases in breadth till it extends all round the cavity; its origin, therefore, is in the form of an acute angle. The villous surface is continued over the remaining cavity, as far as the longitudinal bands extend; and that half of it next the pylorus has three rows of clusters of glands: one row is situated along the great curvature, and consists of fifteen in number; the other two rows are close to the two longitudinal bands, and consist only of nine. Besides these, there are two large clusters of an oblong form, situated transversely, where the longitudinal bands terminate. The internal surface of the rounded cavity, next the pylorus, has a different structure, putting on a tessellated appearance, formed by a corrugated state of the membrane. Immediately beyond the pylorus is a ring of a glandular structure, surrounding the inner surface of the duodenum.

The stomach of the kangaroo, in the peculiarities of its structure, forms an intermediate link between the stomachs of animals which occasionally ruminate; those which have a cuticular reservoir; and those with processes or pouches at their cardiac extremity, the internal membrane of which is more or less glandular. The kangaroo is found to ruminate when fed on hard food. This was observed by Sir Joseph Banks, who had several of these animals in his possession, and frequently amused himself in observing their habits. It is not, however, their constant practice, since those kept in Exeter Change have not been detected in that act. This occasional rumination connects the kangaroo with the ruminant. The stomach having a portion of its surface covered by cuticle, renders it similar to those with cuticular reservoirs; and the small process from the cardia gives it the third distinctive character; indeed it is so small, that it would appear as if it were placed there for no other purpose.

The kangaroo's stomach is occasionally divided into a greater number of portions than any other, since every part of it, like a portion of intestine, can be contracted separately; and when its length and the thinness of its coats are considered, this action becomes necessary to propel the food from one extremity to the other.

Such a structure of stomach makes regurgitation of its contents into the mouth very easily performed. The food in the stomach goes through several preparatory processes; it is sacerated in the cuticular portions; it has the secretion from the pouch in the cardia mixed with it, and is occasionally ruminated. Thus prepared, it is acted on by the secretion of the gastric glands, which probably are those met with in clusters in the course of the longitudinal bands, and afterwards converted by the secretions near the pylorus into chyle.—See Sir E. Home's Lectures on comparative Anatomy, vol. i. p. 155, 4to edit. to which work we are also indebted for the following excellent account of the structure of the stomach of the camel. The structure of this part in the lama, according to the account which Cuvier has given of it in the examination of a fœtus, (*Léçons d'Anat. comparée*, tom. iii. p. 397,) does not differ essentially from that of the camel.

Opportunities of examining the camel rarely occur in this country. One of these, however, was met with thirty years ago, and the late Mr. Hunter availed himself of it, and made several preparations to illustrate the different parts of its structure, which are now in the collection at the College of Surgeons. As the stomach was blown up, and preserved in a dry state, many peculiarities were left unexamined, particularly those respecting the power which the animal has of carrying a provision of water as a supply when traversing the deserts.

Sir E. Home was led by many circumstances to be very desirous of investigating this subject, and in the year 1805,

a favourable opportunity presented itself; a camel in a dying state having been purchased by the board of curators of the College of Surgeons, with a view of illustrating the anatomy of that animal.

As professor of Comparative Anatomy, Sir E. Home was directed to examine the peculiarities of the stomach, and to make a report on that subject.

The camel, the subject of the following observations, was a female, brought from Arabia, twenty-eight years old, and said to have been twenty years in England, and twelve years in the possession of the person from whom the board of curators purchased it. Its height was seven feet from the ground to the tip of the anterior hump.

In December, 1805, when it was purchased by the college, it was so weak, as hardly to be able to stand: it got up with difficulty, and almost immediately kneeled down again.

By being kept warm, and well fed, it recovered so as to be able to walk, but was exceedingly infirm on its feet, and moved with a very slow pace.

It drank regularly every second day six gallons of water, and occasionally seven and a half, but refused to drink in the intervening period. It took the water by large mouthfuls, and slowly, till it had done. The quantity of food it daily consumed, was one peck of oats, one of chaff, and one-third of a truss of hay.

In the beginning of February, 1806, it began to shed its coat. Towards the end of March the wind became extremely cold, and the animal suffered so much from it, that it lost its strength, refused its food, and drank only a small quantity of water at a time.

In this state it was thought advisable to put an end to so miserable an existence, and it suggested itself to the committee appointed for the purposes of this investigation, that if this was done soon after the animal had drunk a quantity of water, the real state of the stomach might be ascertained.

On the second day of April, by giving the animal hay, mixed with a little salt, it was induced to drink, in the course of two hours, three gallons of water, not having taken any the three preceding days, or shewn the least disposition to do so.

Three hours after this, its head was fixed to a beam to prevent the body from falling to the ground after it was dead; and in this situation it was pithed by Mr. Clive, junior, assisted by Mr. Brodie and Mr. Clift.

This operation was performed with a narrow, double-edged poniard passed in between the skull and first vertebra of the neck; in this way the medulla oblongata was divided, and the animal immediately deprived of sensibility.

In the common mode of pithing cattle, the medulla spinalis only is cut through, and the head remains alive, which renders it the most cruel mode of killing animals that could be devised.

The animal was kept suspended, that the viscera might remain in their natural state, and in two hours the cavities of the chest and abdomen were laid open.

The first stomach was the only part of the contents of the abdomen which appeared in view. The smooth portion of the paunch was on the left side, and on the right towards the chest was a cellular structure, in which it was evident to the feeling that there was air; but no part of the solid food with which the general cavity was distended. On the lower posterior part, towards the pelvis, there was another portion made up of cells, larger and more extensive than that which was anterior. On pressing on this part, a fluctuation of its contents could be distinctly perceived. A trochar with the canula was plunged into the most prominent of the cells, and on withdrawing it, there passed through the canula twelve ounces of water of a yellow colour, but unmixed with any solid matter.

This fact having been ascertained, the first cavity was laid open on the left side, at a distance from the cellular structure, and the solid contents were all removed.

While this was doing, some water flowed out of the œsophagus, and some out of the second cavity, but the greater part was retained.

That

That in the second cavity was found nearly pure, while the other was muddy, and of a yellow colour, tinged by the solid contents of the first cavity.

On examining the cellular structure, no part of the solid food had entered it, nor was there any in the second cavity; those cavities having their orifices so constructed as to prevent the solid food from entering even when empty.

On measuring the capacities of these different reservoirs in the dead body, they were as follows:—The anterior cells of the first cavity were capable of containing one quart of water when poured into them. The posterior cells three quarts. One of the largest cells held two ounces and a half, and the cells of the second cavity four quarts. This, however, must be considered as much short of what those cavities can contain in the living animal, since there are large muscles covering the bottom of the cellular structure, to force out the water, which must have been contracted immediately after death, and by that means had diminished the cavities.

By this examination it was proved, in the most satisfactory manner, that the camel, when it drinks, conducts the water in a pure state, into the second cavity; that part of it is retained there, and the rest runs over into the cellular structure of the first, acquiring a yellow colour in its course.

This confirms the account given by M. Buffon, in his examination of the camel's stomach, as well as that of travellers, who state that when the camel dies in the desert, they open the stomach and take out the water which is contained in it to quench their thirst.

That the second cavity in the camel contained water, had been generally asserted, but by what means the water was kept separated from the food, had never been explained, nor had any other part been discovered by which the common offices of a second cavity could be performed. On these grounds Mr. Hunter did not give credit to the assertion, but considered the second cavity of the camel to correspond in its use with that of other ruminants, as appears from his observations on the subject, stated by Dr. Russel, in his history of Aleppo.

The difference of opinion on this subject led Sir Everard to examine accurately the structure of the stomach of the camel, and of those ruminants which have horns; so as to determine, if possible, the peculiar offices belonging to their different cavities.

The camel's stomach anteriorly forms one large bag, but when laid open, this is found to be divided into two compartments, on its posterior part by a strong ridge, which passes down from the right side of the orifice of the œsophagus, in a longitudinal direction. This ridge forms one side of a groove that leads to the orifice of the second cavity, and is continued on beyond that part, becoming one boundary to the cellular structure met with in that situation. From this ridge, eight strong muscular bands go off at right angles, and afterwards form curved lines, till they are insensibly lost in the coats of the stomach. These are at equal distances from each other, and, being intersected in a regular way by transverse muscular septa, form the cells.

This cellular structure is in the left compartment of the first cavity, and there is another of a more superficial kind on the right, placed in exactly the opposite direction, made up of twenty-one rows of smaller cells, but entirely unconnected with the great ridge.

On the left side of the termination of the œsophagus, a broad muscular band has its origin from the coats of the first cavity, and passes down in the form of a fold parallel to the great ridge, till it enters the orifice of the second, where it takes another direction. It is continued along the upper edge of that cavity, and terminates within the orifice of a small bag, which may be termed the third cavity.

This band on one side, and a great ridge on the other, form a canal which leads from the œsophagus down to the cellular structure in the lower part of the first cavity.

The orifice of the second cavity, when this muscle is not in action, is nearly shut; it is at right angles to the side of the first. The second cavity forms a pendulous bag, in which there are twelve rows of cells, formed by as many

strong muscular bands, passing in a transverse direction, and intersected by weaker muscular bands, so as to form the orifices of the cells. Above these cells, between them and the muscle which passes along the upper part of this cavity, is a smooth surface extending from the orifice of this cavity to the termination in the third.

From this account it is evident, that the second cavity neither receives the solid food in the first instance, as in the ruminantia, nor does the food afterwards pass into the cavity or cellular structure.

The food first passes into the first compartment of the first cavity, and that portion of it which lies in the recess, immediately below the entrance of the œsophagus, under which the cells are situated, is kept moist, and is readily returned into the mouth along the groove formed for that purpose, by the action of the strong muscle, which surrounds this part of the stomach, so that the cellular portion of the first cavity in the camel, performs the same office as the second in the ruminants with horns.

While the camel is drinking, the action of the muscular band opens the orifice of the second cavity at the same time that it directs the water into it; and when the cells of that cavity are full, the rest runs off into the cellular structure of the first cavity immediately below, and afterwards into the general cavity. It would appear that camels, when accustomed to go journeys, in which they are kept for an unusual number of days without water, acquire the power of dilating the cells, so as to make them contain a more than ordinary quantity, as a supply for their journey; at least such is the account given by those who have been in Egypt.

When the cud has been chewed, it has to pass along the upper part of the second cavity, before it can reach the third. How this is effected without its falling into the cellular portion, could not, from any inspection of dried specimens, be ascertained; but when the recent stomach is accurately examined, the mode in which this is managed becomes very obvious.

At the time that the cud is to pass from the mouth, the muscular band contracts with so much force that it not only opens the orifice of the second cavity, but acting on the mouth of the third, brings it forward into the second, by which means, the muscular ridges that separate the rows of cells, are brought close together, so as to exclude these cavities from the canal through which the cud passes,

It is this beautiful and very curious mechanism, which forms the peculiar character of the stomach of the camel, dromedary, and lama, fitting them to live in the sandy deserts, where the supplies of water are very precarious.

The first and second cavities of the camel, as well as those of the ruminantia, are lined with a cuticle.

The third cavity in the camel is so small, that were it not for the distinctness of its orifices, it might be overlooked. It is nearly spherical, four inches in diameter, is not like the third of the ruminantia, lined with a cuticle, nor has it any septa projecting into it. The cuticle, continued from the second cavity, terminates immediately within the orifice of the third, the surface of which has a faint appearance of honey-combed structure; but this is so slight as to require a close inspection to ascertain it.

This cavity can answer no other purpose in the œconomy of the animal, than that of retarding the progress of the food, and making it pass by small portions into the fourth cavity; so that the process, whatever it is, which the food undergoes in the third cavity of other ruminants, would appear to be wanting in the camel, and consequently not required.

The fourth cavity lies to the right of the first, and has for a great part of his length, the appearance of an intestine; it then contracts partially, and the lower portion has a near resemblance in its shape, to the human stomach. Its whole length is four feet four inches; when laid open, the internal membrane of the upper portion, is thrown into longitudinal narrow folds, which are continued for about three feet of its length; these terminate in a welted appearance; the ridges are as large as in the bullock, but not so prominent nor so serpentine in their course, and for the last nine inches the membrane

membrane has a villous appearance, as in the human stomach. Close to the pylorus there is a glandular substance of a conical form, which projects into the cavity, the blunt end of it resting upon the orifice of the pylorus. This is similar to what is met with in the bullock, but still more conspicuous.

The fourth cavity of the camel, corresponds with that of the bullock in all the general characters, and resembles it in most particulars. It exceeds it in length; but the plicæ are so much smaller, that the extent of the internal surface must be very nearly the same in both. It differs from it in having a contraction in a transverse direction, immediately below the termination of the plicated part, which has led both Daubenton and Cuvier, to consider these two portions as separate cavities.

On a comparative view of the stomach of the bullock and camel, it appears that in the bullock there are three cavities formed for the preparation of the food, and one for digestion. In the camel there is one cavity, fitted to answer the purposes of two in the bullock; a second, employed as a reservoir for water, having nothing to do with the preparation of the food; a third so small and simple in its structure, that it is not easy to ascertain its particular office. It cannot be compared to any of the preparatory cavities of the ruminantia, as all of them have a cuticular lining, which this has not; we must therefore consider it as a cavity peculiar to ruminants without horns, and that the fourth is the cavity in which the process of digestion is carried on.

Fig. 16.—A posterior view of the first cavity of the camel's stomach unopened; and an internal view of the second, third, and fourth cavities, in their relative situation to the first—similar to the view given of the bullock's stomach, and on the same scale: *a*, the œsophagus; *b b*, the coats of the first cavity in a distended state; *c*, the communication between the first and second cavity; *d d*, the muscle running along its upper part to terminate in the orifice of the third cavity. This muscle, when it acts with its greatest force, brings forward the orifice of the third cavity almost close to that of the second, and shuts up the cells, so that no part of the solid food can pass into them: *e e*, the rows of cells which form a reservoir for the water; *f*, the opening, leading into the third cavity of the stomach; *g*, the third cavity; *h*, the orifice of the fourth cavity; *i i*, the longitudinal plicæ of the fourth cavity; *k k*, the rugous structure of the lower part of the fourth cavity; *l*, the glandular projection opposed to the orifice of the pylorus; *m*, the pylorus; *n*, a dilatation, or membranous cavity between the pylorus and duodenum; *o*, the duodenum.

Of the liver in vermes.—Several testacea, particularly among the bivalves, have a liver surrounding their stomach, and pouring its bile into the cavity of that organ. In many snails it occupies the upper turns of the shell.

A liver exists in all the mollusca, and is very large; but this class has no gall-bladder. The liver is supplied with blood from the aorta, and there is consequently no vena portarum. The vermes of Cuvier, and the zoophytes, have nothing analogous to this gland.

Of the liver in insects.—An organ secreting bile, and which may therefore be regarded as a liver, is found in such animals only of this class as have a heart and system of vessels, viz., in the genus cancer.

Of the liver in fishes.—In many animals of this class, the short intestinal canal is surrounded, and, as it were, consolidated with a long liver. Some fishes, which are almost destitute of fat in the rest of their body, have an abundance of oil in the liver; as, for instance, the skate and cod. It is wanting in some few species. The spleen gradually diminishes in size, from the mammalia to fishes. In the porpoise there are several small spleens; supplied from the arteries of the first stomach. It is always attached to the first, when there are several stomachs.

Of the liver in amphibia.—The liver in the amphibia is universally of considerable size; and in some instances, as the salamander, of immense magnitude. In the tortoise the liver has a peculiar conformation. It is divided into two

round irregular masses, of which one occupies the right hypochondrium, and the other rests on the small curvature of the stomach. Both are connected by two narrow branches of the same structure, into which the principal vessels run. In the green lizard, in the geckos, dragons, iguanas, it forms only a single mass, flat or convex below, and concave above. Its free edge in the dragons has two fossæ, which divide into three lobes, of which the right is prolonged into a sort of tail. In the geckos it has only one fossa, and the right side is also longer than the left. In the common iguana it extends into a long appendix. In the crocodiles and chameleons the liver has two distinct lobes. In the latter it has also a long appendix. It has but one lobe in the serpent tribe, in which it is long and cylindrical. There is but one also in the salamanders, but there are two in the frog genus.

Of the liver in birds.—The liver is much larger in domesticated than in wild birds. It is well-known that the gall-bladder is wanting in many species of this class, (for instance in the pigeon, parrot, &c.) and sometimes in particular individuals of a species, which commonly has it, as in the common fowl.

Of the liver, &c. in mammalia.—Animals of the horse and goat kind, and some of the cetacea, afford instances of the want of this receptacle.

On the contrary, in some of those which have it, there are hepatico-cystic ducts, which convey the bile immediately from the liver into this bladder, as in the horned cattle. It deserves to be remarked here, as a peculiarity of the liver of some four-footed mammalia, which live in or about the sea, namely, the polar bear and some seals, that it seems to possess some poisonous or noxious qualities when employed for food.

Mammalia alone possess a true and proper omentum.

The liver of mammalia is in general divided into more numerous lobes, and the divisions are carried deeper into its substance, than in the human subject. This is particularly the case in the carnivora, where the divisions of the lobes extend through the whole mass.

In many animals of this class, as the horse, the ruminantia, the pachydermata, and whales, the liver is not more divided than in man.

The ductus choledochus forms a pouch between the coats of the intestine, for receiving the pancreatic duct, in the cat and elephant.

All the quadrumana, carnivora, and edentata have a gall-bladder.

Many rodentia, particularly among the rats, want it. The tardigrada; the elephant and rhinoceros, among the pachydermata; the genus cervus and camelus among the ruminating animals; the solipeda; the trichecus and porpoise also want this part. It does not exist in the ostrich and parrot, but is found in all the reptiles. Cuvier thinks that it belongs particularly to carnivorous animals; that it is connected with their habit of long fasting, and serves as a reservoir for the bile.

All the mammalia which want it, except the porpoise, are vegetable eaters; and most reptiles, which universally possess it, live on animal food. (*Leçons d'Anat. comp.* tom. iv. p. 37.)

The valvular transverse folds of the cystic duct belong only to the simia, besides the human subject.

The spleen of the ornithorynchus hystrix is composed of two lobes; the anterior somewhat long and thick, the posterior broader and thinner. Both run obliquely towards the right side to meet at an acute angle in the left hypochondrium. The texture is loose and spongy. See Meckel *De Ornithorhyncho paradoxo*, p. 46.

Those capillary tubes which, because they uniformly bring fluids into the blood, have been described as a separate system—called the absorbent—are not met with as distinct parts in animals that have no very prominent circulating organs. They are absent, therefore, or at least imperceptible, in the vermes and insecta. In fishes, they are destitute of glands or valves; and they open by two common trunks into the united system; and in the amphibia, though these absorbents are readily injected in the mesentery,

no glands are found, either mesenteric or lymphatic, and the common duct is double. In birds there are no mesenteric, but some few lymphatic glands, though they are not strikingly apparent. It is in the mammalia that this system of vessels becomes most strongly marked; yet it has varieties. In the sea-otter, the chyle, after being collected in a *receptacle*, pours itself into the blood by a thoracic duct, formed of several branches; and in the order feræ the mesenteric glands form one mass, called, from its discoverer, the *pancreas Ascllii*.

Of the circulating and breathing systems.—The lowest of the class *vermes*, namely, the zoophytes, betray, as we have before stated, no traces of a distinct circulating system. The crustacea, and the majority of mollusca, have a heart formed of an auricle and ventricle, or of a ventricle only. The ventricle drives the blood into a central aorta, and the vena cava, ere it returns it into the heart, ramifies through the gills. The heart in the cuttle-fish consists of one ventricle and two auricles, which lie at some distance from the ventricle, near the gills, or, according to Cuvier, the cuttle-fish has three hearts, neither of which possesses an auricle. Two of these organs are placed at the root of the two branchiæ; they receive the blood from the body, (the vena cava dividing into two branches, one for each lateral heart,) and propel it into the branchiæ. The returning veins open into the middle heart; from which the aorta proceeds. Some bivalves are said by Poli to have two auricles, and some even four. But in all these crustacean animals, there has been no connexion hitherto discovered between the arteries and veins; orders of this class have a connected system of vessels without a heart. The heart in fishes is extremely small in proportion to the body. Its structure is very simple, as it consists of a single auricle and ventricle, which correspond with the right side of the heart in warm-blooded animals. The ventricle gives rise to a single arterial trunk, (which is expanded in most fishes into a kind of bulb as it leaves the heart,) going straight forwards to the branchiæ, or organs of respiration. The blood passes from these into a large artery, analogous to the aorta, which goes along the spine and supplies the body of the animal; it is then returned by the venæ cavæ into the auricle, which is an arrangement precisely opposite to that of the crustacea, in which the blood traverses the gills as it is returning to the heart instead of permeating them as it proceeds from that cavity.

The circulating system is the most obscure in the *insecta*. The tracheæ, or air-vessels, are plainly visible, but Cuvier has failed to detect, with the microscope, either blood-vessels or absorbents. The first appearance of an attempt at a central circulation is in insects, a membranous tube running down the back and performing alternate contractions and dilatations. These movements probably effect no more than mixing intimately the air that is brought by the trachea with the blood, for no vessels can be seen passing from the tube.

Blumenbach says that the frogs, lizards, and serpents of Germany have a simple heart, consisting of a single ventricle and auricle. That in others, as for instance crocodiles and lizards, properly so called, and serpents, the heart consists of one ventricle with two auricles.

But Cuvier describes and delineates the heart of the crocodile, as being formed nearly like that of the turtle; he says that the iguana has a similar structure, and that it obtains likewise in the serpents. He does not mention the more simple form as existing in any lizard or serpent.

The heart of the turtle possesses two auricles, which are separated by a complete septum, like those of warm-blooded animals, and receive their blood in the same manner as in those animals; viz., the two venæ cavæ terminate in the right auricle, the pulmonary veins in the left. Each pours its blood into the corresponding ventricle, of which cavities there are two; thus the structure of the heart hitherto resembles that of mammalia.

Three characteristic peculiarities distinguish the heart of these animals. First, the two ventricles (and in some species of turtles, the cavities of the auricles) are extremely small and narrow, but the fleshy walls of this viscus are of a thick and

spongy texture, so that the heart has the appearance not so much of a double visceral sac, as of a sponge soaked with blood. Secondly, both the ventricles communicate with each other; there is a muscular, and as it were tubular valve, going from the left to the right cavity, by means of which the former opens into the latter. Thirdly, the large arterial trunks arise all together from the right ventricle only; no vessel coming from the left. The aorta, with its three principal branches, is situated towards the right side and the upper part; the pulmonary artery comes as it were from a particular dilatation of the right ventricle, which is not situated nearly in the middle of the basis of the heart.

Mery and Morgagni considered this dilatation as a third ventricle, *ventriculus intermedius*; hence it has happened, that some zootomists have ascribed to the turtle a single ventricle, (on account of the communication); some two, and others three.

We can now comprehend how this wonderful and anomalous structure, by which all the blood is propelled from the right ventricle only, is accommodated to the peculiar way of life of the animal, which subjects it frequently to remaining for a long time under water. For the greater circulation is so far independent of that which goes through the lungs, that it can proceed while the animal is under water, and thereby prevented from respiring, although the latter is impeded. In warm-blooded animals, on the contrary, no blood can enter the aorta, which has not previously passed through the lungs into the left ventricle; and hence an obstruction of respiration most immediately influences the greater circulation.

The heart of the mammalia and birds differs in no essential respect from that of man. All birds have the right ventricle very strong and of a triangular shape, which some have thought is for the purpose of propelling the blood with great force into the lungs of these animals, because they are destitute of that full expansion which the mode of respiration in the mammalia affords, and is so favorable to the transmission of blood. The mammalia, generally, have not the heart so close to the diaphragm as man has; the simiæ approach him most nearly in this respect.

The heart of the orang-outang is placed obliquely, like that of the human subject; but in other simiæ the apex only is a little inclined to the left, and just touches the diaphragm.

The larger adult bisulca and the pig, have two small flat bones, (which have been called, particularly in the stag, *bones of the heart*) where the aorta arises from the left ventricle.

The right auricle receives, in the porcupine and elephant, two anterior venæ cavæ; the left of which opens near the communication with the ventricle.

We subjoin an account of the beautiful structure of the perfect heart, in the class mammalia, as extracted from Sir E. Home's Lectures:—

“In considering the muscular structure of the heart, it is only intended, at present, to examine the ventricles, which may be reckoned two separate muscles; the right ventricle for sending the blood through the vessels of the lungs, called the lesser circulation; the left, to propel it through the branches of the aorta, which go to every part of the body, called the greater circulation. If these two ventricles are superficially examined, the muscular fibres by which they are united, seem to belong equally to both; one half appearing to be a portion of the right, the other of the left ventricle. Were it so, the sides of the left ventricle, although evidently more muscular and thicker than those of the right, would by no means be so strong in proportion to the effects they have to produce, as it would be natural to expect. We find, however, upon dissection, that the septum is almost wholly a portion of the left ventricle, which gives it a great superiority over the right, and makes it capable of performing the important office of supplying the body with blood. The muscular structure of the left ventricle, detached from the other parts, is an oviform hollow muscle, but more pointed at its apex than the small end of a common egg. It is made

up of two distinct sets of fibres laid upon one another, in the form of strata; those which compose the outer set have their origin around the root of the aorta, and in a spiral manner surround the ventricle to its apex or point, where they terminate, after having made a close half turn. The fibres of the inner set, or stratum, are similar to those of the outer in their origin, in the mode of surrounding the cavity, and in their termination; but their direction is quite the reverse; they decussate the outer set in their whole course; and where the two sets terminate, they are both blended into one mass. There is an advantage gained by this disposition of fibres over every other in the body, which adapts the ventricle so perfectly for its office, that it would almost be impossible to construct it in any other way, so as to answer the purpose for which it is intended. In this muscle, the fibres, by their spiral direction, are nearly one-fourth part longer than the distance between their origin and termination; and the actions of the two sets being in different directions, renders only one-half the quantity of contraction in each fibre necessary, that would have been otherwise required; while the turn both sets make in opposite directions at the apex of the ventricle, fixes it, and prevents lateral motion. In the action of the ventricle, two different effects are produced; the first brings the apex nearer to the basis, by which means the *vis inertia* of the blood will be overcome where the resistance is least, and a direction given to its motion in the course of the aorta; the second brings the sides nearer together, which will accelerate the motion of the blood already begun; and the spiral direction of the fibres renders the power which is applied more uniform through the whole of that action, than it could have been made by any other known form of muscle. By this beautiful mechanism, the muscular fibres of the left ventricle of the heart, perform their office with a smaller quantity of contraction compared to their length (although in themselves proportionally longer,) than those of any other muscle in the body, and, consequently, produce a greater effect in a shorter time. The right ventricle is situated upon the outside of the left, with which it is firmly united; it is not oviform in its shape, but triangular; nor is it uniform in its structure, being made up of two portions, whose fibres have a very different distribution. The portion of the ventricle, which makes a part of the septum of the heart, consists of only one set of fibres, similar in their direction to those of the stratum underneath, belonging to the left ventricle, but from being considerably shorter, they are more oblique than the spiral ones; and at the edge of the cavity they are blended with the fibres of the opposite portion. That portion which is opposite to the septum, is composed of three sets of fibres; those of the external set are nearly longitudinal, the two others which lie under it, decussate each other, and are obliquely transverse in their direction, one passing a little upwards, the other downwards, and both terminate upon the edge of the septum. In the structure of this muscle, we find none of the mechanical advantages so obvious in the left ventricle: the want of these, however, is in some measure compensated by its situation; for the blood contained in its cavity will have the *vis inertia* overcome, and a direction given to its course by the action of the apex of the left ventricle; that motion only requiring to be continued and accelerated, for which purpose this muscle is very well calculated, and in which it is also assisted by the lateral swell of the septum into its cavity during the contraction of the left ventricle."

Of the respiratory system.—Among the vermes, some orders, as those which inhabit corals, the proper zoophytes, and perhaps the intestinal worms, appear to be entirely destitute of particular respiratory organs; so that the function is carried on in these animals by that invisible imbibition which affords them nourishment.

Those vermes, which are furnished with proper organs of respiration, have the same variety in their structure which was remarked in insects. Some, as the cuttle-fish, oyster, &c. have a species of gills, varying in structure in different instances. But the greatest number have air-vessels or tracheæ. Several of the testaceous vermes have both kinds of

respiratory organs. In some of the inhabitants of bivalve shells, as the genus *Venus*, the air-vessels lie between the membranes of a simple or double tubular canal, found at the anterior part of the animal, and capable of voluntary extension and retraction. It serves also for other purposes, as laying the eggs. The margins of its mouth are beset with the openings of the tracheæ.

In the terrestrial gasteropodous mollusca, of which we may instance the snail and slug, there is a cavity in the neck receiving air by a small aperture, which can be opened or shut at the will of the animal. The pulmonary vessels ramify on the sides of the cavity.

Many aquatic insects, as the genus *cancer*, have a species of gills near the attachment of their legs. The others, and particularly the land-insects, which constitute, as is well known, by far the greatest number of this class of animals, are furnished with air-vessels or tracheæ, which ramify over most of their body. These tracheæ are much larger and more numerous in the larva state of such insects as undergo a metamorphosis (in which state also the process of nutrition is carried on to the greatest extent) than after the last, or, as it is called, the perfect change has taken place.

In this class of animals the scorpions, being also provided with fins, present an extraordinary instance of an animal, which, though living nearly in the air, breathes like fishes.

A large air-tube (trachea) lies under the skin on each side of the body of larvæ, and opens externally by nine apertures (stigmata): it produces on the inside the same number of trunks of air-vessels, (branchiæ) which are distributed over the body in innumerable ramifications.

Both the tracheæ and branchiæ are of a shining silvery colour; and their principal membrane consists of spiral fibres. The most numerous and minute ramifications are distributed on the alimentary canal; particularly on the corpus adiposum.

There is a great variety in the number and situation of the external openings by which insects receive their air.

In most instances the stigmata are placed on both sides of the body. The atmospheric air enters by an opening at the end of the abdomen in several aquatic larvæ, and even perfect insects. A very remarkable change in this respect takes place in several animals of this class during their metamorphosis. Thus in the larva of the common gnat (*Culex pipiens*), the air enters by an opening on the abdomen; while in the nymph of the same animal, it gains admission by two apertures on the head.

Fishes breathe with gills or branchiæ; which are placed behind the head, on both sides, and have a moveable gill-cover (operculum branchiale), which is wanting in the order of pisces chondropterygii only. By means of these organs, which are connected with the throat, the animal receives its oxygen from the air contained in the water; as those animals which breathe, derive it immediately from the atmosphere. They afterwards discharge the water through the branchial openings (aperturæ branchiales).

The gills receive the venous blood by means of the branchial artery, and this blood is sent into the aorta after its conversion into the arterial state. The distribution of these vessels on the folds and divisions of the gills constitutes one of the most delicate and minute pieces of structure in the animal economy.

Each of the gills consists, in most fishes, of four divisions, resting on the same number of arched portions of bone or cartilage, connected to the os hyoides. Generally there is only a single opening for the discharge of the water; but in many cases, particularly among the cartilaginous fishes, there are several openings.

The lungs of amphibia are distinguished from those of warm-blooded animals, both by a great superiority in point of size, as well as by a greater looseness of texture; which circumstances are serviceable in swimming in many of these animals.

It is well known that the lungs of turtles and frogs do not collapse on opening the animals, like those of mammalia, but often remain expanded, at least partially, for some time.

In the frogs, lizards, and serpents, the lung consists of a cavity, the sides of which are cellular. The lower, or posterior part of the organ, either forms a mere membranous bag (the parietes of which are not cellular), or else the vesicles are larger at that part than elsewhere. In the serpents the lung has that elongated form, which characterizes all the viscera of these animals. A considerable portion of it is a simple membranous cavity; and this is supplied with arteries from the surrounding trunks. The turtles have a more complicated structure, or one which approaches more nearly to that of the warm-blooded classes. The lungs are uniform in their texture throughout, but the vesicles are very large. The cartilaginous annuli of the bronchi terminate before these vessels enter the lungs.

There are numerous projecting processes in the lungs of the chameleon and newt; in the latter animal they terminate behind in an elongated bladder. The serpents, at least for the most part, have only a single lung, which forms an elongated vesicular bag. In a coluber of four feet and a half long, the lung measured one foot one inch; its anterior half resembled a muscular intestine in appearance, and had an elegantly reticulated internal surface, which resembled on a small scale the inner surface of the second stomach of the ruminating animals. The posterior part formed merely a simple and long cavity with thin sides.

In the tadpole, and the young of such lizards as bring forth in water, there are two organs, which somewhat resemble the gills of a fish (appendices fimbriate, Swammerdam). These appendices are connected to the sides of the neck, and hang loose from the animal; they are not permanent, but are gradually withdrawn into the chest, (within a few days, in the reptiles of Germany), where their remains may still be perceived for some time near to the true lungs. That doubtful animal, the siren lacertina from Carolina, has, according to Hunter's dissection, two bladder-like lungs, besides the external branchiæ.

The same circumstance holds good respecting that no less mysterious creature, the proteus anguinus, from the Cirknitz or Sitticher lake of Carniola; whose remarkable internal structure has been described and delineated by Dr. Schreibern in the Philos. Trans. for 1801; and more recently by Signors Configliachi and Rusconi in their elaborate monograph on the proteus anguinus.

The lungs of birds are comparatively small, flattened, and adherent above to the chest, where they seem to be placed in the intervals of the ribs: they are only covered by the pleura on their under surface, so that they are in fact on the outside of the cavity of the chest, if we consider that cavity as being defined by the pleura. The cartilaginous annuli of the trachea, which are in general more complete in the other mammalia than in man, are perfect circles in birds, and overlap each other at their upper and lower margins. Hence the diameter of this part is not affected by any twisting motion of the neck. A great part of the thorax, as well as the abdomen, is occupied by the membranous air-cells, into which the lungs open by considerable apertures. Those of the thorax are divided, at least in the larger birds, by membranous transverse septa into smaller portions, each of which, as well as the abdominal cells, has a particular opening of communication with the air-cells of the lungs, and consequently with the trachea. The membranes of these cells in the larger birds are provided here and there with considerable fasciculi of muscular fibres, which have been regarded as a substitute for the diaphragm, which is wanting in this class of animals. They also serve very principally, as we may ascertain by examining large birds in a living state, to drive back again into the lungs the air which they received in inspiration, whence the repletion and depletion of the thoracic cells must alternate with those of the abdominal cavities.

Besides these cells, a considerable portion of the skeleton is formed into receptacles for air in most birds; for there are indeed exceptions and considerable variations in the different genera and species. This structure is particularly marked in the larger cylindrical bones, as the scapula, clavicle, and femur. It is also found in most of the broad and multan-

gular bones of the trunk, as the sternum, ossa innominata, dorsal vertebræ, &c. All these are destitute of marrow in the adult bird, at least in their middle; so that the cylindrical bones form large tubes, which are only interrupted towards the extremities by a sort of transverse bony fibres; the broad bones are filled with a reticulated bony texture, the cells of which are empty. They have considerable apertures (most easily shewn in those extremities of the cylindrical bones which are turned towards the sternum) communicating with the lungs by small air-cells; which facts may be shewn by various experiments on living and dead birds.

These receptacles of air, of course, serve the purpose of lightening the body of the bird in order to facilitate its motions. This effect is produced in most birds to assist their flight; in some aquatic species, for the purpose of swimming; in the ostrich and some others for running. Hence we find the largest and most numerous bony cells in birds which have the highest and most rapid flight, as the eagle, &c. And hence also the bones of the bird which has just left the egg, are filled with a bloody marrow, which is absorbed soon after birth, entirely in some, in others, particularly among the aquatic species, for the greater part. In many birds the interval between the two tables of the cranium contains air, but the apertures for its admission are not connected with the lungs, but merely with the Eustachian tube. The same, also, is the case with the immense bill of some birds, which are for that reason called *levirostres*.

The lungs of quadrupeds agree on the whole in structure, form, and connexion, with those of the human subject. In the cetacea, on the contrary, and in the web-footed mammalia (as the manati), which approach most nearly to them, they are distinguished by a firmer texture, particularly of the investing membrane, and by their peculiar form; since they are not divided into lobes, but have an elongated and flattened appearance. They are adherent to the pleura, as well as to the very strong and muscular diaphragm.

The annexed figures shew the parts of the circulating and respiratory systems in the different classes.

In fig. 17 we see the heart of the barnacle, where *a a* shews the heart situated in the intestine near the stomach; *b*, four large vessels which arise from its upper extremity; and *c*, two smaller ones, the larger of which is thin skinned, the smaller of thick parietes; it terminates at *d*, in several ramifications. The exterior of this creature's heart is irregularly furrowed. Within it is, as in more perfect animals, furnished with fleshy fibres. It has no auricle. The same vessels ramify on the gills as furnish the rest of the body.

Fig. 27, the heart of the *sæpia officinalis*: *a*, the heart situate in the abdomen; it is a full muscle, oblong and triangular, smooth externally; the interior, moderately furnished with fibres, hath many anfractuosities; *b b*, the auricles, two in number, cut off at the origin of the pulmonary vessels.

At fig. 21 is seen the heart of the bee. It is situated along the back as in silkworms, &c. It is a long tube bulging a little in places, fibrous and strong, and is marked *a a*; on each of its sides the delicate tracheæ, *b b*, are situated. These are spread out upon very fine membranes, *c c*, which serve also to contain fat; amid this fat muscular fibres may be seen, which have been conjectured to be useful in the circulation, by contracting and pressing the sides of the heart, and to press also the air from the tracheæ into it; *f f f*, mark the situation of muscular fibres that serve for the movement of the abdominal rings. The figures 1, 2, 3, 4, 5, indicate these abdominal rings.

The ovary is seen in the same figure, marked *e e*. There are two ovaries in most insects, and in some more removed from one another than in others.

At fig. 22 we have a representation of the heart in the common garden caterpillar, marked *a*. This organ is a small thin oblong canal, furnished with transverse contractile rings and longitudinal bands, that passes along the body, traversing successively the tail, abdomen, thorax, and penetrating some way into the brain. This canal has enlargements in different parts, and a multitude of tracheæ ramify on its surface. The muscular fibres previously described, produce contractions of this

this heart, but its dilatation is effected by a multitude of muscles, which at first sight appear as one, but may by care be divided.

Fig. 17. The arterial system of the frog.

Fig. 18. The venous system of the frog.

Fig. 17. *a*, The ventricle; *b*, the auricle. The aorta is seen issuing from the ventricle, and dividing into two branches; *c* on the right, and *d* on the left sides. These vessels divide into three chief branches, the first of which, *eee*, goes to the substance of the lungs in part, and partly to the air cells, around which it forms anastomoses with the pulmonary vein. Its divisions are represented as divided; these pulmonary arteries send off two recurrent branches, *ff*, to the mouth.

The second pair of branches are represented at *gg*, where they form a considerable dilatation, of a dark grey colour; these arteries form a similar dilatation a little higher, and are distributed to the respiratory muscles of the mouth and chest.

The third pair of principal branches of the main artery are considerable. These branches form the trunk of the lumbar aorta, by uniting together. Each arising from the great trunk near the heart, forms a curve near the lungs, *hh*; they give off, 1, the axillary, *ii*, which arise from their outer side; 2, the carotid, *kk*, which run up to the head, and penetrate its bones; 3, the vertebral, which unites with its fellow by an extensive anastomosis, from which the common trunk of the coeliac and inferior mesenteric is derived; 4, many small arteries, as the lumbar, *nn*; those going to the testicles; to the ovaries, *oo*; to the kidneys, *p*, &c. Finally the trunk divides into two iliacs.

Fig. 18. The distribution of the veins is very different from that of the arteries. The two trunks of the vena cava, *a a*, which arise from the upper part of the auricle, where the two arterial trunks that are cut off, are situate, send off two pulmonary veins, *c c*, also cut off, that are double the size of the corresponding arteries, and are distributed to the pulmonary cells. The two superior trunks of the vena cava superior, are situate upon the corresponding arteries, and, like them, divide into several branches, of which some, *d d*, are distributed to the different parts of the mouth; others, *e e*, turn upwards to the head, distributing a few branches, *ff*, to the fore-legs; the axillary veins, *g g*, which chiefly belong to the fore-legs, send two remarkable branches, *h h*, to the iliac region, where they are distributed between the muscles and the skin. The inferior vena cava, *i i*, that arises from the apex of the heart, divides into three branches, which are distributed to the liver, *k k*; a little below, the mesenteric vein, *l*, emerges from the liver; *m*, indicates the renal veins; *n*, the iliac; *o*, the epigastric.

The fig. 25 shews the respiratory system in the butterfly. The tracheæ, *a a*, lie among the ovaries and the fat.

At fig. 11 is represented the interior of the chrysalis of the bee: *a a*, indicate the stomach perforated by numerous tracheæ, and covered by muscular fibres, marked *e e*; *b b*, the œsophagus; *c c*, glandulous bodies; *g*, four intestinal cœca, terminating below the pylorus, *f*, at *h h*; *i* shews the remaining portion of the intestine, to the extremity whereof the sting is represented adhering. The shadowed parts of the figure marked *l*, shew the appearance the coagulated food in the stomach presents through its parietes.

Some difference between the pulmonary systems of the preceding insect and the bee, will be observed by referring to fig. 24. In the latter the ramifications of the tracheæ dilate into two large bags, *a a*, whence other ramifications pass out, *b b*, which terminate in other vesicles, *c c*, which again send forth branches, *d d*, and, by the continuance of this arrangement, the air is carried by vessels, *e c*, to all parts of the body.

In the scarabæus nasicornis, it will be noticed, that while a worm, this animal has merely as tracheæ, minute vessels carrying air, but that afterwards these are swelled out into vesicles, or air cells. These are readily distinguished by a reference to fig. 23. They are hollow cylinders somewhat leaf-shaped, of a white colour and flocculent appearance.

VOL. XXIV. No. 1677.

The tracheæ leading to them have, on the other hand, the shining appearance of mother of pearl.

Fig. 8 shews the circulating and respiratory systems of the ephemera; *oo*, mark the tracheæ; *tt*, the heart; *ss*, a sort of pen lying beneath the tracheæ; *v v v*, the tracheæ cut off; *x x x*, enlargements taking place in different parts of the heart.

Urinary organs are absent in the vermes and insecta.—“Although,” as Blumenbach observes, “we cannot perceive of what use an urinary bladder can be to fishes, and animals which live in water, several genera and species have one.”

These are the two large bags which Blumenbach and Cuvier represent as urinary bladders of the frog and toad, but are stated by Townson to have no connexion with the ureter. Indeed it is very clear that the ureters open at the posterior part of the rectum, while these two receptacles terminate on the front of that intestine. He states that the fluid contained in these reservoirs is a pure water. The size of these bags, which exceeds all ordinary proportion to the bulk of the kidney, renders it likewise probable that they are not receptacles of urine. Either of the bags is at least twenty or thirty times as large as the kidney. The testudo has a bladder.

The kidneys of birds (with a few exceptions, as the cormorant, &c.) form a double row of distinct but connected glandular bodies, placed on both sides of the lumbar vertebræ, in cavities of the ossa innominata; one of the most instructive examples of the remarkable analogy between the structure of the secreting viscera, properly so called, and the conglomerate glands. The urinary bladder is wanting in the whole class, and the ureters open into the cloaca.

The structure of the kidney in mammalia displays two very opposite varieties, which may be called the simple and the conglomerate kidneys. In the former there is a single papilla, which is surrounded by an exterior crust of the cortical substance. This is the case in all the feræ; and in some other animals, as many rodentia. The other kind of kidney consists of an aggregation of small kidneys, connected by cellular substance. It appears that this form of the gland is found in all those mammalia which either live in, or frequent the water. Thus in the seal and porpoise the small kidneys are extremely numerous, and send branches to the ureter without forming a pelvis. Mr. Hunter states that this structure belongs to all the whales. The otter has the same structure; but its small kidneys are not so numerous as in the animals above-mentioned. The brown bear, (*ursus arctos*) however, which lives on land, has this structure as well as the white polar bear, (*ursus maritimus*) which inhabiting the coasts and floating ice of the northern regions, spends much of its time in the water. But the badger, (*ursus meles*) which is a very similar animal, has the uni-lobular kidney. The number of small kidneys in the bear is 50 or 60; and it appears that each consists of two papillæ. The suprarenal glands, (*glandulæ suprarenales*) as their name implies, are intimately connected with the kidneys; but their functions, as well as those of the thyroid and thoracic glands, still remain unknown. They appear, from the latest anatomical researches, to have a great sympathy with the sexual organs. The urinary bladder is more loose in the abdomen of most quadrupeds than in the human subject. It is comparatively much smaller in carnivorous than in herbivorous animals; and is particularly large in the ruminating bisulca and the hare.

The external covering of the body is, in a great number of vermes, a mere organ of defence; in many others it is the grand organ of imbibition and respiration. In insects it performs the offices of defence, and, by means of the tracheæ, that open upon it, of respiration. The epidermis is very early seen as a distinct membrane.

In the testacea it usually covers the surface of the shell, and obscures the brilliancy of that part until it is removed. It may be seen by plunging a snail-shell into boiling water. It is very thick and villous in some species, as in the *arca pilosa*.

Crustacea have it; also insects, both in their perfect and larva states. It is shed in the latter several times before the change to the state of chrysalis; seven times in most of the butterflies and bombyces.

It is very distinct in the vermes, as in the common earth-worm and leech, which often shed it. In the sipunculus saccatus it is loose and not adherent to the surface.

All fishes, without exception, are covered with scales, which are bare in those which inhabit the open sea, but on the contrary are covered with a mucous membrane in those which live on coasts, or in fresh water. It is remarkable that the colour of the skin in some fishes, as for instance, the mullet, (*mullus barbatus*) depends on that of the liver. The scales are not changed like hair and feathers, but are perennial; and are said to receive yearly an additional layer to their laminated texture, from the number of which the age of the animal may consequently be determined.

The very various integuments which are found in amphibia, consisting of shields, rings, scales, or simple skin, are covered externally with cuticle, which is frequently separated in many of these animals, as in the snake, (forming what is called snakes-shirt *leberis, senecta,*) and water-newt.

The process of separation is repeated every week for some time in the latter animal, particularly in spring and autumn. Some, which have small fine scales, as the chameleon, or a simple skin, as some frogs, change their colour occasionally, either from difference in the light or warmth, or from the effect of their passions.

The integuments of birds consist of three parts. Some are furnished with hair in particular situations; as the vultur *barbatus*, the raven, and the turkey. Others, as the cassowary, have long spines like fish-bones in their wings, which approach in the tubular structure of their roots, to the formation of feathers; the universal and peculiar covering of this class of animals. The particular differences in the formation of the feathers are innumerable. Among the most remarkable are the small scale-like feathers (*squamulæ ciliatæ*) of the penguin's wing; and the horny, flat, and pointed processes on the tip of the neck, and wing-feathers of the common fowl in its wild state; and on those of the Bohemian chattering (*ampelis garrulus*). Several birds in different orders have two or more feathers arising from a common quill.

Blumenbach found in a young ostrich, which had just quitted the egg, as many as twenty feathers on the back, proceeding from a single barrel.

The cetacea have the epidermis quite smooth; and marked with none of those lines which are so often seen in the other mammalia.

It is detached from the surface, in the form of small scales, in all the mammalia, except the whales; and in some this happens chiefly at the season when their hair is shed. It gives the skin a branny appearance.

It is in the rete mucosum that the colour of the skin resides; but this part possesses, in very few instances, any brilliancy of colour in the mammalia. It is of a beautiful red and violet on the nose and buttocks of some baboons; and silvery white on the abdomen of the cetacea. It is remarkably thick on these animals; being about the sixteenth of an inch on the back, and such parts as are of a black colour.

The vascular net-work, says De Blainville, in the work referred to by Blumenbach, which is situated immediately over the cutis, occupying its whole surface, is in general of an exceedingly thin texture; it is formed entirely of arterial, venous, and lymphatic vessels, which undergo many complex ramifications and anastomoses; this net-work is spread over the projections situated on the surface of the cutis. The pigmentum does not perhaps exist in all animals; it forms at the surface of the vascular net-work a layer more or less defined, of slight consistence, semi-fluid, and in effect composed entirely of very minute grains, agglutinated to each other, without any organic continuity between their own particles or with the other portions of the skin; it is a sort of artificial membrane or depository, which is variously coloured, and

which seems to be exhaled by the parietes of the veins. This pigmentum and the vascular net-work are both crossed by the nervous extremities which meet at the surface of the skin, sometimes under the form of papillæ. These two parts of the skin are those, which, since the time of Malpighi, have been known by the name of Malpighi's net-work, *corpus reticulare, reticulum mucosum*, on account of the sort of net-work which they form for the passage, not only of the nervous papillæ, but also of the accessory parts. They are both in my opinion, says De Blainville, the source of the colouring matter, and the pigmentum is the depository of that matter.

The cutis of mammalia varies infinitely in thickness. It is extremely thin and delicate in the wing of the bat, and on the contrary exceedingly thick in the rhinoceros, elephant, &c. also in the web-footed animals, particularly the walrus. The form of the papillæ on its external surface is very various in the different animals of this class, as, indeed, in different parts of the same animal. They are sometimes threadlike, as on the paws of the bear, and are very elegant on the teats of the true whale (*balæna mysticetus*).

The colour of the rete mucosum varies, even in individuals of the same species, as in the different races of mankind. It is thickest in some cetacea.

In some spotted domestic animals, particularly the sheep, rabbit, and dog, there is a remarkable connexion between the colour of the palate, and even sometimes of the iris, and that of the skin; for spots of similar descriptions are found in both parts.

The cuticle is often of very unequal thickness in particular parts, from the different purposes to which it is destined. Thus it is very thin on the points of the fingers in apes and baboons, when compared with its great thickness where it covers the callosities on which they sit. In various multungula, particularly the elephant, it forms a kind of horny processes.

Hairs, at least single ones, are found in all adult mammalia, even without excepting the cetacea. In various states of thickness and strength they constitute every intermediate substance, from the finest wool to the strongest quills of the porcupine.

We may here take notice of some organs destined for the secretion of peculiar fluids.

1st. Both species of the elephant, viz. the African and Indian, have a considerable gland at the temple, between the eye and meatus auditorius, secreting in the rutting season a brownish juice, which is discharged through an opening in the skin.

2d. A remarkable gland is found on the back of the musk-hog, or peccary (*sus tajaçu*), over the sacrum. It is of a considerable size (between two and three inches long, and above an inch broad) and is composed of several lobules, whose ducts join into one canal, which penetrates the skin. It furnishes a secretion of a very pleasant musk-like odour, from which Tyson denominated the animal *aper moschiferus*. The opening of this part on the back has been described by many authors as the navel.

3d. In most of the ruminating animals, and in the hare, there are cavities in the groins, near the genitals, called by Pallas *antra inguinalia*, and containing a strong scented sebaceous substance, secreted from glands which lie under the integuments.

4th. Some other mammalia have pouches on the abdomen, covered internally with a fine hair, and containing fatty secretions of peculiar odours. Of this kind are the bags near the anus of the badger, and that which contains the teats of the female marsupial animals.

5th. There are also in the badger and the opossum, as well as in several other carnivorous animals, (both among the digitata and palmata,) peculiar glands and bags at the end of the rectum, secreting a yellow substance of a strong and disagreeable smell in its recent state, and which frequently gives to their excrement a kind of musk-like odour. These glands may be seen very well in the cat. Their secretion possesses that strong disagreeable odour which characterizes so remarkably many animals of this order, as the fox and all the weasel tribe,

tribe, and which has made the polecat proverbial even in common language, and has bestowed on it its scientific name, *mustela putorius*. Some American species exceed the fetor even of the polecat. This is the case with the *viverra mephitica* and coasse (the skunk and squash). They pour out the fetid matter when pursued; and are thereby effectually defended, as neither man nor animal can approach them. Several rodentia also possess them.

6th. Another kind of similar glands and bags secrete strong scented matters, but are rather connected with the genitals. These are found in some of the same carnivorous animals which possess the anal glands, as the lion, the civet, &c.; also in many herbivora, which want the latter organs; in some of whom they exist in both sexes, as in the beaver, the *ondatra*, (*mus zibethicus*) &c.; in others they are peculiar to the male, as in the musk animal, whose pouch is found in the prepuce near the navel.

7th. The glands which secrete the oil, on the upper part of the tail, in aquatic birds.

8th. Anal glands, which disseminate a strong specific odour at certain times, are found in some animals of the class amphibia; for instance, in the cayman, (*lacerta alligator*) and the rattle-snake.

9th. An acrid fluid exudes through numerous pores of the skin in some reptiles when they are irritated; as in the salamander and in toads. It is said that the gecko secretes a really venomous fluid between its toes.

10th. The mucus which besmears their skin and scales in fishes, and which is formed in canals lying near the lateral lines, and in the same direction with them; one or more of these canals running on each side from the head to the tail-fin. In some fishes the mucus is poured out in the intervals of the scales; but in others those parts are perforated by regular openings for its discharge.

11th. Besides the different secretions of peculiar matters which belong exclusively to single species of insects, as the vapour, which some carabi (*carabus crepitans*, *marginatus*, &c.) discharge, the strong odours with which several of the bug-kind defend themselves in case of necessity, and the wax of honey bees. Two kinds of secreted fluid deserve to be particularly remarked in this class: the silk which is formed by the larvæ of phalenæ (moths) and by spiders; and the poison with which several hymenopterous and apterous insects are armed.

12th. The formation of the calcareous matter of the shells of testacea, which takes place in a peculiar viscus lying near the heart (*sacculus calcarius*, Swammerd. See fig. 4).

13th. Several acephalous mollusca produce a kind of silk, similar to that of the larvæ of insects. It is sometimes called the beard; and is employed by the animal in order to attach itself to rocks, &c. It is formed by a conglomerate gland, placed near the foot, which latter part draws out the silk from the excretory duct, and moulds it in a groove on its surface. The sea-muscle, (*mytilus*) the pinna, and perna, exemplify this structure. The pinna produces it in such quantity, and of such quality, as to admit of its being manufactured into gloves, which is done at Messina and Palermo.

14th. The black inky fluid of the cuttle-fish, which has often been supposed to be the bile, is a very singular secretion, that must be noticed in this place. The bag in which it is contained has a fine callous internal surface, and its excretory duct opens near the anus. The fluid itself is thick, but miscible with water to such a degree, that a very small quantity will colour a vast bulk of water; and the animal employs it in this way to elude the pursuit of its enemies. Cuvier says, the Indian ink, which comes from China, is made of this fluid.

We now proceed to an account of the organs by which the species is reproduced.

The lowest animals seem to recur even below plants, in the simplicity of the powers they require for generation. In the article BOTANY, we have shewn that by far the greater number of plants are produced by a very complicated kind

of generation; that, commonly, the union of two sexes is required; or that where one individual procreates, it is not without possessing distinct male and female organs. But some zoophytes continually secrete new beings as they enlarge; which, when detached, are, from that instant, almost perfect forms. It is true, plants may be propagated from cuttings, but the slow evolution of these will not bear any comparison with the almost immediate indication of the powers of life, that a section of the polype displays. See HYDRA.

In the genera of acephalous mollusca, *ostrea mustelus*, &c., as well as in the *echinus* and *asterias*, no other parts of generation are visible, except an ovarium, varying in form and colour.

Most of the gasteropodous mollusca are true hermaphrodites, and have the male and female organs of generation united in the same individual; but they copulate so that each fecundates and is fecundated. The common slug (*limax*) and snail (*helix*) afford the most familiar examples of this structure. They possess an ovarium, oviduct, testis, vas deferens, and penis. The oviduct and vas deferens open into a cavity situated under the right superior horn; and the penis is contained in the same cavity. The latter part enters the oviduct of the other animal, at the time of copulation.

The snail has, in addition to these organs, a very singular one, the use of which is quite obscure. It consists of a cavity with an eminence at bottom, from which a sharp pointed, thin, calcareous body proceeds. This can be thrust forth from the cavity, and is employed by the snails to prick each other before the act of copulation.

The *sæpia* has, in the female, a very simple genital apparatus. There are two ovaries and a tube leading from them to the anus.

The part which corresponds to the soft roe of bony fishes, contains at the spawning season, several hundred small tubular seminal receptacles, (about four lines in length); these are placed in bundles towards the vas deferens, and are contained in a thick fluid. These tubes are expelled from the body in an entire state, when a spiral vessel, which they contain, together with the semen, as in a sheath, bursts their thin anterior extremity, from which the semen escapes and impregnates the spawn of the female.

The generative system in the male bee is extremely singular. The penis is erected in the following manner:—this organ is, in its quiescent state, merely a thin collapsed membrane, but by the action of the abdominal muscles the animal can force the air into it, so as to *turn it inside out*, and distend it to a considerable size. The bee has vesiculæ seminales, of enormous size, testes, and vasa deferentia, which form dilatations larger than the testes itself; moreover the penis is variously divided, as is seen in fig. 27. It does not appear that this apparatus can be introduced into the female.

The *ascaris lumbricoides* has an opening in the middle of the belly, which branches out into two tubes that gradually becoming contracted and contorted, form oviducts.

“The *ascaris*,” according to Blumenbach, “has one testis, occupying nearly the middle of the animal’s body, and consisting of a single vessel convoluted into a long bundle, but admitting of being unravelled with facility, when it appears to be about three feet in length. Towards the posterior part of the worm it forms a larger tube, which nearly equals a crow’s quill in size, and becomes connected to the penis, which lies concealed near the tail, and is probably projected at the time of copulation.” But Dr. Hooper states that he has never found any distinction of sex in these worms, but that they all possess the parts described as belonging to the female. The representation of Cuvier agrees with that of Dr. Hooper.

The animals of this class exhibit numerous varieties of structure in the different genera and species.

In the *gryllus verrucivorus*, Blumenbach notices the large testicles, with their convoluted fasciculi of vessels, which bear a very close resemblance to the ovaries.

In the moth of the silk-worm, (*bombyx mori*) we distinguish,

tinguish, besides the testes, long vasa deferentia, even a kind of vesiculæ seminales, and a very considerable penis, with a hook-shaped glans.

Each of the large ovaria of the female gryllus verrucivorus contains about fifty ova, disposed in bundles. The two organs are connected together at their posterior extremities, and open between the two sheaths of a part by which they are discharged from the body.

In the silkworm moth, on the contrary, the ovarium resembles four rows of pearls; each row contains about sixty ova, which are laid from the end of the abdomen, after passing through a short duct, which has, however, connected with it several vesicular processes of uncertain use.

The male organs of generation possess very different structures in the different orders of fishes.

In the torpedo there are manifest testicles, consisting partly of innumerable glandular and granular bodies, and partly of a substance like the soft roe of bony fishes. We find also vasa deferentia, and a vesicula seminalis, which opens into the rectum by means of a small papilla.

The soft roe supplies the place of testes in the carp, and most other bony fishes. It forms two elongated flat viscera of a white colour, and irregular tuberculated surface; placed at the sides of the intestines and swimming-bladder, so that the left encloses the rectum in a kind of groove. Through the middle of each soft roe passes a ductus deferens, which opens behind into a kind of vesicula seminalis, and this terminates in the cloaca. It is a curious circumstance that hermaphrodites, possessing the complete organs of both sexes, are found frequently in this species.

In the female torpedo there are two uteri, communicating with the cloaca by means of a common vagina. The oviducts form one infundibulum, which receives the ova as they successively arrive at maturity. These are very large in comparison with those of the bony fishes. The yolk, in its passage through the oviduct, acquires its albumen and shell. The latter is of a horny consistence, and is known by the name of the sea-mouse. It has an elongated quadrangular figure, and its four corners are curved and pointed in the skate, while they form horny plaited eminences in the sharks. The secretion of the albumen, and the formation of the shell are performed by the papillous internal surface of the duct; and chiefly by two glandular swellings which appear towards its anterior extremity in the summer months while the eggs are being laid.

The structure is much more simple in the carp, and probably also in the other oviparous bony fishes. The two roes occupy the same position as the soft roe of the male does. They are placed at the side of the intestines, liver, and swimming bladder, as far as the anus. They consist of a delicate membrane inclosing the ova, which are all of one size, and extremely numerous (more than 200,000 in the carp); and terminate by a common opening behind the anus.

The kidney, testes, and epididymis, lie close together in the testudines, but each of the three organs may be distinguished, by its peculiar colour and structure, on the first view. They have no vesiculæ seminales, according to Blumenbach, though Lieberkuhn speaks of them. The penis is very large, and retracted within the cloaca in its ordinary state. Instead of an urethra, this part contains a groove, whose margins approach to each other, when the part is erected, so as to form a closed canal. This may be compared with the groove-like continuation of the cesophagus, which goes into the third stomach of ruminating animals. The glans terminates in an obtuse hook-like point, somewhat resembling the end of the elephant's trunk.

Frogs have large vesiculæ seminales, and a small papilla in the cloaca instead of a penis. Both these parts are wanting in the toad.

Crocodyles have a simple penis, while lizards have two; and the water-newt, which does not copulate, has no organ of the kind.

Serpents have long slender testicles, no vesiculæ seminales, but a double penis, each of which has a bifid point covered with sharp papillæ.

The tortoise has a manifest clitoris, lying in the cloaca. The oviducts are double, and have two openings into the cloaca.

Frogs have two long convoluted oviducts which arise by open orifices at the sides of the heart. The ovaria lie under the liver, so that it is difficult to conceive how the ova get into the above-mentioned openings. These oviducts form a large and thick-sided protuberance, which Blumenbach calls, improperly, a uterus. The uterus opens into the cloaca.

The toads have not this large uterus; but their oviducts terminate by a common tube in the cloaca.

Lizards have on the whole a similar structure to that of the last-mentioned animals, and the ovaria contain fewer ova, and serpents also. The serpents have double external openings of the genitals for the reception of the double organs of the male.

The testes, which lie near the kidneys, and the ductus deferentes, are the only male organs which are constantly found in the whole class of birds. In a very few instances, as in the cock, the last mentioned canals terminate in a dilated part, which has been considered analogous to the vesiculæ seminales. Instead of a penis, most birds have in the cloaca two small papillæ, on which the seminal ducts terminate. But some have a simple penis of considerable length, which is ordinarily concealed and retracted within the cloaca; but remains visible externally for some time after copulation. It forms a long worm-shaped tube in the drake, and constitutes a groove in the ostrich, which is visible when the animal discharges its urine.

The female organs of generation in birds, may be most conveniently arranged under three divisions: the external parts including the cloaca; the tubus genitalis (which answers to the Fallopian tube of the mammalia or oviduct,) resembling an intestine; and, lastly, the ovarium, which is almost entirely separate from the latter part.

As the general structure of these parts is very uniform in all birds, we may take as an example the most familiarly known species, the *hen*.

The external opening of the genitals consists of a transverse slit behind the ossa pubis, which do not form a symphysis; this is larger in the hen than in the cock; and its smaller anterior labium is covered by the larger posterior one (velabrum).

This slit leads to the cloaca, in which several organs open. These are the rectum; the two ureters on the prominent margin of that part; the vagina on the left; behind which, and on the upper part of the cloaca, there is the *bursa Fabricii*.

A scrotum, or bag, in which the testes hang on the outside of the abdominal cavity, exists only in the mammalia; but is not by any means common to all the genera. It is not found in the aquatic animals of this class, nor in those which live under ground, as the *mole*; nor in such as roll themselves up on the approach of danger, as the *hedgehog*. Some mammalia, again, have the power of withdrawing these glands from the abdomen, and retracting them into the cavity according to circumstances; as the *guinea-pig*, the *squirrel*, the *rat*, the hamster, (*marmota cricetus*) and Canadian musk-rat (*mus zibethicus*).

A scrotum exists in all the quadrumana and in most of the carnivora; in animals of the opossum kind, which have it in front of the pelvis; in the hare and gerboa; in most of the ruminating genera, and in the solidungula.

The testes are placed under the skin of the perineum in the pachydermata and the civet; or under that of the groin, as in the camel and otter. They pass from the abdomen into one or the other of these situations, particularly at the rutting season, in the bats, the mole, shrew, and hedgehog; and in several rodentia, as the rat, guinea-pig, porcupine, beaver, squirrel, &c. They remain constantly in the abdomen in the ornithorhynchus paradoxus and hystrix, in the elephant, hyrax, the amphibious mammalia, and the cetacea.

The tunica vaginalis exists constantly in the mammalia, and the cavity of this covering always communicates by means of a narrow canal, with the abdomen.

In several quadrupeds, as the *dog*, *horse*, *ram*, and others, there

there is a body composed of condensed cellular substance, lying according to the axis of the testicle near the epididymis, and known by the name of *corpus Highmori*.

The vasa deferentia are usually enlarged in size, and assume a cellular structure for some short distance previous to their termination. The structure of this part is particularly remarkable in the *horse*.

Most species of mammalia, (and, with the exception of the cetacea, some out of every other order in the class,) possess vesiculæ seminales. The vesiculæ seminales swell to a vast size in the rutting season in many animals, as in some of the simiæ, and most particularly in the *hedgehog*.

The following animals have no vesiculæ seminales, according to Cuvier: the plantigrada, except the racoon and hedgehog; all the carnivora and marsupial animals; the ruminantia, the seals, the cetacea, and the two species of ornithorhynchus. Their existence or absence does not seem to follow any general law.

In the hedgehog these parts are of a vast size, much exceeding the volume of the testes. The rodentia are generally distinguished by the great size of their vesicles. These parts in the guinea-pig are long, uniform, cylindrical cavities, containing generally a firm cheesy matter. In the boar they are very large, and of a lobulated structure; a common excretory duct receives the branches from the lobes. In the horse they form two large and simple membranous bags, opening near the vasa deferentia, but separately.

The possession of a prostate (in some instances simple, but generally divided into two parts) is peculiar to the mammalia, and seems to take place in every species of the whole class.

In many species the penis consists of a single corpus cavernosum, without any septum. The pig and the cetacea furnish examples of this structure; and in the latter animals there are numerous tendinous layers crossing it.

In some species, where the act of copulation requires a longer portion of time, as in the dog, badger, &c. the corpus spongiosum of the glans, and of the posterior part of the penis, swells during the act much more considerably than the rest of the organ, and thus the male and female are held together during a sufficient space of time for the discharge of the seminal fluid.

In the quadrumana and bats the penis hangs loose from the pubis as in man. In most of the other mammalia it is contained in a sheath of the integuments, which extends nearly to the navcl. This sheath has an adductor and a retractor muscle. The penis is generally folded when drawn within the sheath, on account of its length. In some animals it turns back when it has reached the front of the pubis, and passes out near the anus; this is the case with the guinea-pig, marmot, and squirrel. It goes directly backwards from the beginning in the hare, rat, dormouse, and opossum, where the prepuce is found close to the anus.

The corpora cavernosa form a cylindrical ring in the kangaroo, and the urethra passes in the centre.

Several species of mammalia possess a peculiar bone in the penis, generally of a cylindrical form, but sometimes grooved. This is the case with some of the simiæ, most of the bat-kind, the hamster, and several others of the mouse-kind, the dog, bear, badger, weasel, seal, walrus, &c. It is somewhat remarkable this bone should not be found in all the species of the same genus.

In most of the male animals of this class the urethra runs on to the end of the glans, and forms a common passage for the urine, prostatic liquor, and semen. In some few species, the passage which conducts the two former fluids, is distinct from that of the seminal liquor. The bifid fork-like glans of the opossum has three openings, one at the point of bifurcation for transmitting the urine; and two for the seminal fluid at the two extremities of the glans. The short urethra of the ornithorhynchus paradoxus opens directly into the cloaca, and the large penis of the animal serves merely to conduct the seminal fluid. It divides into two parts at its extremity, and each of these is furnished with sharp papillæ, which are perforated for the passage of the semen. A similar structure

exists in the ornithorhynchus hystrix, where the penis divides into four glandes.

In some species of the cat-kind the glans is covered with retroverted papillæ, which may enable the male to hold the female longer in his embraces. Horny pointed processes turned backwards are found in the penis of the savia paca.

Lastly, it deserves to be mentioned, that in some species of this class, the male penis, while unerected, is turned backwards, so that the urine is voided in the male in the same direction as in the female. The hare, lion, and camel, afford instances of this structure. But these retromingents do not copulate backwards.

The clitoris probably is wanting in no other instance in the mammalia than the ornithorhynchus. It contains a small bone in several species of mammalia, as the marmota citillus, the racoon, (ursus lotor) the lioness, the sea-otter, &c., and in the opossum it possesses a bifid glans, like that of the penis.

In consequence of the horizontal position of the body of quadrupeds, the clitoris is at the under-margin of the orifice of the vagina, instead of the upper one, as in women.

Blumenbach says, "a true hymen, or one at least, which in form and situation resembles that of the human subject, has been observed in no other animal." But according to Cuvier, the mare and ass, and some of the simiæ, have an analogous structure. Hence he concludes, that the hymen is not a part exclusively peculiar to the human species.

The vagina of quadrupeds is distinguished from that of the human subject by two chief characters: its direction, which corresponds with the axis of the uterus, and the structure of its internal surface, which is little villous.

Dr. Gärtner, of Copenhagen, has recently called the attention of anatomists to the existence of two canals in the vagina and uterus of the cow, and some other mammalia. These canals commence in the neighbourhood of the Fallopian tubes, and open into the vagina near the meatus urinarius.

The structure and form of the uterus vary very considerably in this class. In no instance does it possess that thickness, nor has its parenchyma that density and toughness which are observed in the human female.

The variations in form of the impregnated uterus are reduced by Blumenbach to the following heads:

1. The simple uterus without horns (uterus simplex) which is generally of a pyramidal or oval figure. This is exemplified in those animals where we have stated that it possesses thick coats. Its circumference in some simiæ presents a more triangular form than in the woman: and towards the upper part, in the neighbourhood of the Fallopian tubes, there is an obscure division into two blind sacs (as in the gibbon, or long-armed ape); this distinction is more strongly expressed in the lori, (lemur tardigradus) so as to form a manifest approach to the uterus bicornis.

2. A simple uterus with straight or convoluted horns (uterus bicornis). They are straight in the bitch, in the racoon, in the bats of this country, (Germany) in the sea-otter, seal, &c., somewhat convoluted in the cetacea, mare, and hedgehog, and still more tortuous in the bisulca.

3. A double uterus, having the appearance of two horns, which open separately into the vagina; this is seen in the hare, mole, and rabbit (uterus duplex).

4. A double uterus, with extraordinary lateral convolutions, is met with in the opossum and kangaroo (uterus anfractuosus).

These various forms undergo different changes in the pregnant state.

The alteration in the simple uterus is, on the whole, analogous to that which occurs in the human female.

The pregnant uterus bicornis suffers a different change in those animals, which bear only one at a time, from that which it undergoes in the multipara. The foetus of the mare is confined in its situation to the proper uterus. In the cow it extends at the same time into one of the horns, which is enlarged for its reception. In those, on the contrary, which bring forth many young at once, as also in the double uterus of the hare and rabbit, both cornua are divided by con-

tracted portions into a number of pouches corresponding to that of the young; and where those horns are straight in the unimpregnated state, as in the bitch, they become convoluted.

The uterus anfractuosus of the marsupial animals undergoes the least change from its usual appearance in the impregnated state. For these strange animals bring their young into the world so disproportionately small, that they appear like early abortions.

The Fallopian tubes are convoluted upon each other in a kind of knob in some instances, as the *simia sylvanus*, and still more remarkably in the opossum. The fimbriæ are sometimes shaped like a funnel, as in the rabbit.

The ovaria are generally of an oval form, and have the ovula Graafiana buried in their parenchyma. These vesicles, however, project externally in some cases, as in the pig. In the hedgehog they are quite loose and separate, so that the ovary resembles a bunch of grapes.

We shall now proceed to examine the evolution of the two kinds of germs: first of the ova; and, secondly, of the fœtus. The ovum has only been properly examined in the birds and amphibia.

The egg is covered, within the shell, by a white and firm membrane, (*membrana albuminis*) which contains no blood-vessels. The two layers of this membrane, which in other parts adhere closely to each other, leave at the large end a space which is filled with atmospheric air.

This membrane includes the two *whites of the egg*, each of which is surrounded by a delicate membrane. The external of these is the most fluid and transparent, the inner one thicker and more opaque; they may be separated in eggs which are boiled hard.

The internal white surrounds the yolk, which is contained in a peculiar membrane, called the *yolk-bag*. From each end of this proceeds a white knotty body, which terminates in a flocculent extremity in the albumen. These are called the *chalazæ*, or *grandines*. Leveille distinguishes a third *white*, and considers the *chalazæ* as absorbing vessels floating in it, and destined to absorb it as well as the inner albumen, and mix them with the yolk during incubation.

A small, round, milk-white spot, called the tread of the cock, (*cicatricula* or *macula*) is formed on the surface of the yolk-bag. It is surrounded by one, or more, whitish concentric circles (*halones* or *circuli*).

A small shining spot of an elongated form, with rounded extremities, but narrowest in the middle, is perceived at the end of the first day, not in nor upon the *cicatricula*, but very near that part on the yolk-bag (*nidus pulli*, *colliquamentum*, *areola pellucida*). This may be said to appear before-hand, as the abode of the chick which is to follow.

No trace of the latter can be discerned before the beginning of the second day, and then it has an incurvated form, resembling a gelatinous filament, with large extremities, very closely surrounded by the amnion, which, at first, can scarcely be distinguished from it.

About this time the halones enlarge their circles, but they soon after disappear entirely, as well as the *cicatricula*.

The first appearance of red blood is discerned on the surface of the yolk-bag, towards the end of the second day. A series of points is observed, which form grooves, and these, closing, constitute vessels, the trunks of which become connected to the chick. The vascular surface itself is called *figura venosa*, or *area vasculosa*; and the vessel by which its margin is defined, *vena terminalis*. The trunk of all the veins joins the *vena portæ*, while the arteries, which ramify on the yolk-bag, arise from the mesenteric artery of the chick.

On the commencement of the third day, the newly-formed heart is discerned by means of its triple pulsation, and constitutes a threefold *punctum saliens*. Some parts of the incubated chicken are destined to undergo successive alterations in their form; and this holds good of the heart in particular. In its first formation it resembles a tortuous canal, and consists of three dilatations lying close together,

and arranged in a triangle. One of these, which is properly the right, is then the common auricle; the other is the only ventricle, but afterwards the left; and the third is the dilated part of the aorta (*bulbus aortæ*).

About the same time, the spine, which was originally extended in a straight line, becomes incurvated; and the distinction of the vertebræ is very plain. The eyes may be distinguished by their black pigment, and comparatively immense size.

From the fourth day, when the chicken has attained the length of four lines, and its most important abdominal viscera, as the stomach, intestines, and liver, are visible, (the gall-bladder, however, does not appear till the sixth day,) a vascular membrane (*chorion*, or *membrana umbilicalis*) begins to form about the navel; and increases in the following days with such rapidity, that it covers nearly the whole inner surface of the shell within the *membrana albuminis* during the latter half of incubation. This seems to supply the place of the lungs, and to carry on the respiratory process instead of those organs. The lungs themselves begin indeed to be formed on the fifth day; but, as in the fœtus of the mammalia, they must be quite incapable of performing their functions while the chick is contained in the amnion.

Voluntary motion is first observed on the sixth day, when the chick is about seven lines in length.

Ossification commences on the ninth day, when the ossific juice is first secreted, and hardened into bony points (*puncta ossificationis*).

At the same period, the marks of the elegant yellow vessels (*vasa vitelli lutea*) on the yolk-bag, begin to be visible.

On the fourteenth day the feathers appear; and the animal is now able to open its mouth for air, if taken out of the egg.

On the nineteenth day it is able to utter sounds; and on the twenty-first to break through its shell.

We shall conclude with one or two remarks on those very singular membranes, the yolk-bag and chorion, which are so essential to the life and preservation of the animal.

The chorion, that most simple yet most perfect temporary substitute for the lungs, if examined in the latter half of incubation in an egg very cautiously opened, presents a surface covered with numberless ramifications of arterial and venous vessels. The latter are of the bright scarlet colour, as they carry oxygenated blood to the chick; the arteries, on the contrary, are of the deep or livid red, and bring the carbonated blood from the body of the animal. Hence, as is well known, the incubated bird perishes if the shell be varnished over, as the respiratory process is thereby suspended. The trunks of the arteries are connected with the iliac vessels; and on account of the thinness of their coats, they afford the best microscopical object for demonstrating the circulation in a warm-blooded animal.

The other membrane, the *membrana vitelli*, is also connected to the body of the chick; but by a two-fold union, and in a very different manner from the former. It is joined to the small intestine, by means of the *ductus vitello-intestinalis* (*pedunculus*, *apophysis*), and also by the blood-vessels, with the mesenteric artery and *vena portæ*. This is regarded by Leveille merely as a ligament. It is well known that no true yolk is discoverable in the intestine of the incubated chick. Yet sometimes (not indeed always, but under certain circumstances not yet sufficiently understood) air will pass from the intestine through this part into the yolk-bag.

The analogous umbilical bag of the fœtal-shark (which is found also in several other fishes, and some reptiles,) is connected to the small intestine; at least to the *bursa entiana*, which is a peculiar dilatation of the posterior end of the intestine.

In the course of the incubation the yolk becomes constantly thinner and paler, by the admixture of the inner white. At the same time innumerable fringe-like vessels, with flocculent extremities, of a most singular and unexampled structure, form on the inner surface of the yolk-bag, opposite to the yellow ramified marks above mentioned, and hang

hang into the yolk. There can be no doubt that they have the office of absorbing the yolk, and conveying it into the veins of the yolk-bag; where it is assimilated to the blood, and applied to the nutrition of the chick.

The first parts which can be discerned in the uterus after impregnation, are the membranes (involucra) of the ovum; in which (the marsupial animals excepted) the embryo itself becomes visible after a certain period. By means of the navel-string the fœtus is connected to these membranes, and consequently to the uterus of the mother; from which its nourishment is derived until the time of birth.

The mode of connexion of the pregnant uterus with the membranes of the ovum, and thereby with the embryo itself, displays three chief differences in the various mammalia.

Either the whole external surface of the ovum adheres to the cavity of the uterus; or the connexion is effected by means of a simple placenta; or by numerous small placenta (cotyledons).

The first kind of structure is observed in the *sow*; and is still more manifest in the *mare*.

In those animals of this class, where the embryo is nourished by means of a placenta, remarkable varieties occur in the several species; sometimes in the form and successive changes of the part, sometimes in the structure of the organ, as being more simple or complicated. Thus in most of the digitated mammalia, as well as in the quadrumana, the placenta has a roundish form; yet it consists sometimes of two halves lying near together; and in the *dog*, *cat*, *martin*, &c. it resembles a belt (cingulum or zona). Its form in the *polecat* is intermediate between these two structures; as there are two round masses joined by an intervening narrower portion.

In several species of digitated mammalia the external surface of the placenta is provided with a white and apparently glandular body (corpus glandulosum Everardi, or subplacenta,) smaller than the proper placenta by which it is inclosed. In proportion as the embryo becomes more mature, this part admits of more easy separation from the placenta.

The placenta of the bisulca is divided into numerous cotyledons; the structure of which is very interesting, as it elucidates the whole physiology of this organ. The parts designated by this appellation are certain fleshy excrescences, (glandulæ uterinæ) produced from the surface of the impregnated uterus, and having a corresponding number of flocculent fasciculi of blood-vessels, (carunculæ) which grow from the external surface of the chorion implanted in them. Thus the uterine and fœtal portions of the placenta are manifestly distinct from each other, and are easily separable as the fœtus advances to maturity. The latter only are discharged with the after-birth, while the former, or the cotyledons gradually disappear from the surface of the uterus after it has parted with its contents. The number and form of these excrescences vary in the different genera and species. In the sheep and cow they sometimes amount to a hundred. In the former animal and the goat, they are, as the name implies, concave eminences; while on the contrary, in the cow, deer, &c. their surface is rounded or convex.

In the foal, as in the child, the chord possesses a single umbilical vein; whilst most other quadrupeds have two, which unite however into a common trunk near the body of the fœtus, or just within it.

The amnion, or innermost of the two membranes of the ovum, which belongs to the pregnant woman, as well as to the mammalia, is distinguished in some of the latter, as for instance in the cow and mare, by its numerous blood-vessels; while on the contrary, in the human subject, it possesses no discernible vascular ramification.

Between the chorion and amnion there is a part found in most pregnant quadrupeds, and even in the cetacea, which does not belong to the human ovum, viz. the allantois, or urinary membrane. The latter name is derived from the connexion which this part has, by means of the urachus, with the urinary bladder of the fœtus; whence the watery fluid, which it contains, has been regarded as the urine of the animal. The term allantois has arisen from the sausage-like

form which the part possesses in the bisulca and the pig; although this shape is not found in several other genera and species. Thus, in the hare, rabbit, guinea-pig, &c. it resembles a small flask; and it is oval in the polecat. It covers the whole internal surface of the chorion in the solidungula, and therefore incloses the foal with its amnion. It contains most frequently in these animals, (although not rarely in the cow) larger or smaller masses of an apparently coagulated sediment in various forms and number, which has been long known by the singular name of the horse-venom or hippomanes.

Some orders and genera of mammalia resemble the human subject in having no allantois; as the quadrumana and the hedgehog; nay, in the latter animal, the urinary bladder has no trace whatever of urachus; which even exists in a certain degree in the human subject; but its fundus is perfectly spherical in the fœtus.

There is in the hedgehog, as well as in the dog, cat, and others, a peculiar part called the tunica erythroides, situated between the chorion and amnion like the allantois, for which it might easily be mistaken on the first view. It contains a watery fluid at the commencement of pregnancy, but is easily distinguished from an allantois, as it is not joined to the fundus of the bladder by the urachus, but is connected by means of the omphalo-mesenteric veins, with the mesenteric blood-vessels of the fœtus. This connexion constitutes a resemblance on one hand to the yolk-bag of the incubated bird, and on the other hand to that remarkable vesicula umbilicalis, which is observable in the early months of pregnancy. The tunica erythroides, as well as that vesicula, are most complete in young embryos, and are, on the contrary, so diminished in subsequent periods, that their functions must be connected with the earlier stages of existence.

The first trace of the formation of an embryo cannot be discovered in the different species of this class until a considerable time after conception. The original formation, as in the human subject, is widely distant from the subsequent perfection of the mature fœtus: and the growth and formation of the members, instead of proceeding alike in the whole class, are so ordered in particular species, that those external organs, which are most necessary to the young animal, according to its peculiar mode of life, are formed and completed the soonest. Hence arises the great size of the posterior hands of the fetal quadrumana, of the feet of the squirrel, of such animals in short as are destined to live in trees; likewise of those of the foal and kid, which are obliged to use their legs immediately after birth, when compared with the corresponding parts of the mature human fœtus.

Having gone through the descriptions of the particular organs in the five classes, the reader may now turn to the following figures, which shew these parts *in situ*.

Fig. 3 and 4, already in great part described, are a specimen of the internal organs of the class vermes.

Fig. 4. The dotted portion, *i i*, of fig. 4, is filled up by the muscles that retain or propel the animal, and move the intestines; these latter parts and the liver cover the shadowed parts. The veins are shewn at *a*, coming from the limb, and toward the auricle, *d*, opening into the ventricle, *c*. We see the calcareous sac at *e*, and its duct running along the intestinum rectum, *m*; *h* marks the aorta arising from the ventricle, and ramifying through the body, and *g*, a remarkable swelling its commencement undergoes, similar to what is seen in fishes; *o* shews the oviducts, *p* the ovaries, and *r* the œsophagus.

Fig. 29 is a specimen of the internal organs in the class insectæ: *a a*, the two principal trunks of the tracheæ, which carry the air over the body; *b*, the branches they send to the head; *c c*, those to the muscles of the thorax, and of the wings; *d d*, those to the abdominal muscles, and to the medulla spinalis; *e e*, to the vesiculæ seminales; *f*, to the stigmata; *g g*, to the skin; *i i*, to the wing covers; *k k*, the medulla spinalis; ** the optic nerves.

Fig. 26. A specimen of the internal parts in fishes. An internal

internal view of the belly of the viviparous dog-fish, *squalus acanthius* of Linnæus, to shew the appearance of the stomach and intestine *in situ*, and their relative situation to the other viscera: *a*, the heart; *b b*, the liver; the left lobe is cut away to expose the parts behind; *c*, the œsophagus; *d*, the cardiac portion of the stomach; *e*, the pyloric portion; *f*, the small cavity between the pylorus and duodenum; *g*, the duodenum; *h h*, the valvular intestine; *i i*, an appendix, with which it communicates; *k k*, the testicle; *l l*, the vas deferens, the lower portion of which is straight, and distended with semen; *m*, the cavity which is the reservoir of semen, and urinary bladder; *n*, the kidney; *o*, the penis; *p p*, two external openings leading into the cavity of the abdomen; *q q*, the two holders, in their collapsed state.

Fig. 26*. A male burbot, (*gadus lota*) laid open, in order to shew the position of the various viscera: the branchial membrane also, (*c*), is stretched, in order to display the gills; *a*, the heart; *d*, the abdominal fin; *e*, the pectoral fin; *f*, the inferior layer of the pericardium; *g*, the liver; *h*, the testicles; *i*, the spleen; *k*, the intestine; *l*, the rectum; *m*, the bladder; *n*, the anus; *o*, the anal fin.

Fig. 19 and 20, specimens of the internal parts *in situ* in the amphibia: 19, being a dissection of a female frog; 20, the interior of a fecundated female frog.

19. *a*, A pin that holds up the retroverted heart of the frog; *b*, the heart; *c c*, the fimbriated extremities of the oviducts; *d d*, sinuosities of the oviducts, and *e*, blood-vessels of the fimbriæ; *f*, the opening of these ducts into the two enlarged cavities, *g g*, analogous to the uterus of higher animals; they terminate in the rectum, *h*, wherein also the double urinary bladder opens at *i*.

The same figure represents the ovary of one side, *k*; it is contracted, and far removed from the fimbriæ of the oviducts; *l*, one of the kidneys; *m*, the fatty appendices of the ovaries; *n n*, two small ova, floating in the cavity of the abdomen; *o*, an ovum in the oviduct.

p, shews the stomach and small intestines; *q*, part of the liver; *r*, the gall bladder; *s s*, the lungs and pulmonary vessels, one lung being partly removed, the other distended with air; *t t*, the auricle of the heart, (internally divided by a valve); *u u*, the cut edges of the integuments of the chest and abdomen.

Fig. 20. The ova in the ovaries: *a*, ova dispersed through the abdomen; *b, c*, some near the fimbriæ; *d, e*, some within the oviduct; *f*, some entering the uterine portion of the duct; *g*, one side of this uterine portion in its natural state, transparent, and therefore discovering its contained eggs; *h*, the opposite side opened, to display these completely; *i*, the single opening of both the false uteri. In the upper part of the figure are seen the heart and aorta: *k k*, the two branches this gives off; *l l*, the orifices of the oviducts; *m m*, the lungs.

Fig. 7 denotes the ovaries of the louse: *a*, two flat bodies that project beyond the vulva; *b b b*, the extremities of the oviducts, united on one side as they always are, until separated by the dissector; *c*, the oviduct with perfect eggs *d*, or such as are incipient, *e e*; *f*, the two main branches of the oviducts; *g g*, the five subdivisions of each; *h*, indicates what Swammerdam calls the uterus, containing an ovum; *i k*, a sac that pours a glutinous secretion upon the ovum; *l*, a contracted part of the uterus.

Fig. 9 marks the ovaries of the snail: *r*, the ova inflated.

Of the locomotive system in vermes and insectæ.—In the mollusca, the first trace of a skeleton is in the sœpiæ, where it forms a cartilaginous ring, closely connected with the nervous circle of the neck.

In some testacea the body is enclosed in a solid calcareous tube, with the addition of some detached portions serving to bore into wood, as in the tereidines. In other instances the number of portions of calcareous shell is multiplied, as in the balani, where they are six. Lastly, the form of the bivalve shells undergoes a variety of modifications, the two pieces being sometimes similar, at others altogether unlike, as in the oyster; or completely incorporated, as in the pinnæ.

As for the efficient apparatus for motion, the muscles, the most remarkable organ belonging to it is a fibrous membrane, which commonly surrounds the whole of the body, and is called generally the cloak.

The opening of the shells in bivalves is effected by a fibrous ligament at the hinge; as an antagonist to which there is usually a strong short muscle at the anterior and posterior extremities of the shells, attached to both of them, and serving to bring them together: such is the case in *Venus mya*, *unio*, *solen*, and many other genera. In others of the bivalves, however, as *ostrea*, *spondylus*, &c., there is but one muscle of this kind. In the next place we have to consider the *foot*, as it is called, serving not only as an organ of locomotion, but also for many other purposes: it is a fleshy mass, which contains the intestine, liver, and ovary, is attached by muscles of its own to the shell, and in some genera, as *cardium* and *mytilus*, is considerably elongated and apparently highly organized. In the fresh-water muscle, the foot, when employed in creeping along the ground like a snail, and stretched to its full length, is as long as the entire animal, though scarcely half its size when retracted; it is covered on each side with a double layer of decussating muscular fibres, which terminate posteriorly in two long, and anteriorly in two short tendons attached to the shell; its basis, also, presents many transverse fibres. In other genera, the structure of the foot varies in a greater or less degree from that here described; the most important circumstance, however, to be remarked, is, that the excretory duct of a gland opens on its base in several genera (*mytilus*, *pinnæ*, *avicula*, &c.) and pours out a tenacious mucus, which the animal draws into threads by the tongue-like point of the foot, and in that manner attaches itself to the rocks.

Of the active organs of motion in snails, slugs, &c., without shells, the most important is an external muscular membrane, (*panniculus carnosus*) in which the viscera are contained as in a bag. Strong fibres decussating in every direction, are found on this covering, and particularly on its broad abdominal surface. The name of *foot* is applied to that part on which the animal crawls. Mucus is copiously secreted from the under surface of this part, by which means the animal attaches itself, as well as by the vacuum produced by fixing its edges, and then retracting the space included within them.

We have, in fig. 46, an example of the locomotive system in an helix, where *q* marks the foot; *a* marks the spiral portion of the shell, into which the majority of the muscles are inserted; *b b*, muscles of the foot; *c*, of the tail, or hinder part of the foot; *d*, the point to which the anterior muscles are attached; *e*, the small muscle which retracts the mouth, throat, and tongue *g*, which is armed with teeth; *f*; *d d*, the muscles that retract the eyes and larger horns, *k k*; (*i i*, the optic nerves are seen across them;) *l l*, small muscles that retract the lips; *m m*, retractors of the lesser horns; *n n*, very strong muscles inserted into the middle of the body, and compressing it.

The principal organ of motion, in the articulated worms, is a fibrous muscular membrane, inclosing the viscera, and placed immediately beneath the external mucous covering. In it we particularly distinguish four bundles of longitudinal fibres; two of which are placed on the belly, and two on the back; and by the alternate or simultaneous contractions of which the various motions of the body are effected. When bristles or tufts of hair supply the place of feet in locomotion, they are set in action by peculiar fibres, which enable the animal to regulate their protrusion and retraction at pleasure. Where these are wanting, and where the progression of the animal is accomplished by fixing the extremities alternately, we find either moveable hooks, as in several of the intestinal worms, or else two suckers situated at each extremity of the body. In the order crustaceæ, we find that the articulation of the body, as it exists in insects, becomes more evident; new organs of motion—feet, being also developed at the rings or joints of the body.

Locomotion in the crustacea is performed by tolerably firm muscles, which present this peculiarity in their disposition

tion, that, as the skeleton constitutes the external covering of the body, so they are situated within the bony cylinders of the body and limbs, to the motions of which they contribute. Thus in crabs, each of the five legs on each side consists of five joints, to which, in the first pair, a sixth is superadded, being connected with the fifth articulation, and assisting to form the claws or nippers. Internally, each leg is prolonged under the dorsal plate in the form of a horny expansion, supporting the gills, and coinciding both in form and function with a scapula. Each joint of the leg contains an extensor and flexor muscle for the joint beyond it, the muscles of the first joint being attached to the horny plate within the thorax, in the same manner as the muscles of the upper arm in other animals are attached to the scapula. The muscles of the first pair of legs are particularly strong, as these are larger than the others, and constitute the nippers; the thumb of which, if we may call it so, is moved with greater force by strong muscles filling the spacious cavity of the fifth phalax. Besides the muscles of the limbs, those of the tail also, are very considerable, forming a superior and inferior layer of complicated bundles of fibres, which are separated by the interposition of the rectum in its passage through the tail.

A great diversity exists in the class *insecta*. In the centipedes, for instance, we still find the perfect shape of the vermes; and even their legs are but little more than the moveable bristles of those animals. Others, again, as the scorpions and spiders, rather resemble crabs; their organs of locomotion, in point of organization, coinciding remarkably with the crustacea. But, neither in these nor in other insects, do we find a calcareous shell, the external moveable skeleton being uniformly composed of *horny* plates. As to the external organs of motion, the structure of the legs, the number and position of which are liable to many varieties, coincides pretty closely with crabs. The wings of insects are attached to the *pectus*, and moved by muscles placed within it.

Before a single step can be taken with regard to the locomotive system in the remaining classes, it will be necessary to give an account of their skeletons.

The skeleton in fishes is extremely various. They agree together, however, on the whole, in having a spine, which extends from the cranium to the tail-fin; and in having the other fins, particularly those of the thorax and abdomen, articulated with peculiar bones destined to that purpose. They have in general many bones unconnected with the rest of the skeleton.

The cranium in several cartilaginous fishes (in the skate for instance) has a very simple structure, consisting chiefly of one large piece. In the bony fishes, on the contrary, its component parts are very numerous; amounting to eighty in the head of the perch. Most of the latter have a more or less moveable under-jaw.

Great variety in the structure of the teeth is observed in this class. Some genera, as the sturgeon, are toothless. Their jaws, which are distinct from the cranium, form a moveable part, capable of being thrust forwards from the mouth, and again retracted.

Those fishes which possess teeth, differ very much in the form, number, and position of these organs. Some species of bream (as the *sparus probato-cephalus*) have front teeth almost like those of man; they are provided with fangs, which are contained in alveoli. In many genera of fishes the teeth are formed by processes of the jaw-bones covered with a crust of enamel. In most of the sharks, the mouth is furnished with very numerous teeth for the supply of such as may be lost. The white shark has more than two hundred, lying on each other in rows, almost like the leaves of an artichoke. Those only which form the front row have a perpendicular direction, and are completely uncovered. Those of the subsequent rows are, on the contrary, smaller, have their points turned backwards, and are covered with a kind of gum. These come through the covering substance, and pass forward when any teeth of the front row are lost.

Vol. XXIV. No. 1677.

It will be understood from this description that the teeth in question cannot have any fangs.

The saw-fish only (*squalus pristis*) has teeth implanted in the bone on both sides of the sword-shaped organ with which its head is armed.

In some fishes the palate, in others the bone of the tongue (as in the frog-fish), in others (as in several of the ray-kind) the aperture of the mouth forms a continuous surface of tooth.

In the long-shaped fishes with short fins, the spine consists of a proportionally greater number of vertebræ; of which the eel, for instance, has more than one hundred, and some sharks even more than two hundred. The main piece, or body, as it is called, of these vertebræ, is of a cylindrical figure, with a funnel-shaped depression on both surfaces, and concentric rings, which are said to vary in number according to the age of the animal. The spinal marrow passes above these, in a canal formed at the roots of the spinous processes.

The ribs are articulated with what are called the dorsal vertebræ in most of the spinous fishes; but in some they are without this connexion, and in the cartilaginous fishes proper ribs cannot be said to exist.

Of the peculiar bones which serve as a basis for the fins, that of the pectoral fin may be compared to the scapula, and that of the abdominal in some measure to the os innominatum.

Fig. 30 is an example of the skeleton in fishes. It is the cyprinus *alburnus*: *a*, the occipital bone; *b*, the parietal bone; *c*, the frontal bone; *d*, the nasal bone; *e*, the superior maxillary bone, moveable and arched like the inferior maxilla; *f*, the intermaxillary bone, likewise moveable and arched; *g*, the inferior maxilla; *h*, fossa for the olfactory organ; *i*, arch of the zygoma; *i**, the orbit; *k*, the os quadratum; *l*, the operculum; *m*, the lingual bone; *n*, the lingual cartilage; *o*, the radii of the branchial membrane; *p*, bones of the shoulder; *q*, scapular appendage, by means of which the osseous belt of the shoulder is attached to the cranium; *r*, a rudiment of bones of the arm, supporting the radii of the thoracic fins; *s*, furcular bone; *t*, thoracic fin; *u*, abdominal fin; *u**, a rudiment of bones of the pelvis, to which the abdominal fin is attached; *v*, dorsal fin; *w*, anal fin; *x*, caudal fin, supported by, *y*, the radiating laminæ of the last caudal vertebræ.

Fig. 31. Head and thorax of the long-nosed shark:—*a*, the superior maxillary bone; *g*, the inferior maxilla; *n*, the lingual cartilage; *p*, bones of the shoulder; *t*, thoracic fin; *c*, the sternal cartilage; *d*, the branchial arches, or thoracic ribs; *e*, the external cartilaginous laminæ and arches, appended to the proper branchial arches.

The muscles of this class are distinguished from those of animals which breathe by means of lungs, not only by receiving a smaller supply of blood, and consequently being of a paler colour, but also by their disposition in layers, and by the uniformity of their substance, which in general is destitute of tendinous fibres. This structure, together with the number and bulk of their muscles, is well calculated to support that great expenditure of strength and exertion, which is a necessary consequence of the peculiar abode, and whole economy of these animals.

Fig. 30*. The muscles of the cyprinus *alburnus*, as they appear after the common integuments are removed: *k*, operculum; *o*, an elastic ligament for raising the eye; *r*, a muscle which, with the following one, depresses the superior maxilla; *s*, a retractor of the angle of the mouth; *t*, elevator of the inferior maxilla; *u*, depressor of the same part; *v*, abductor of the pectoral fin, (*h*); *x*, the great lateral muscle, composed of numerous bundles of fibres; *y*, muscular fasciculus of the caudal fin, (*c*); *d*, elevator of the dorsal fin, (*e*); muscular fasciculus of the abdominal fin, (*g*).

On the skeleton of *amphibia*.—The testudines, (turtles and tortoises) whose whole skeleton, and indeed whose whole body has a very peculiar structure, are entirely toothless; they have, however, a kind of os intermaxillare in the upper jaw. The horny covering of the jaws, particularly the upper

one, has some resemblance to the horse's hoof, in the mode of its connexion with the jaw. The cavity, containing the brain, is extremely small, in comparison with the size of the skull; the greatest part of which, in the turtle, is occupied by the large lateral fossæ, holding the eye and the powerful muscles that move the lower jaw. This circumstance is still more remarkable in the crocodile.

The trunk is consolidated with the two great shells of the animal; the dorsal vertebræ and ribs being attached to the upper, the sternum being fixed in the lower or abdominal shell.

The same bones are found in the pelvis of these animals, as in the mammalia; but the proportion of their relative size is inverted. For instance, the ossa pubis are so deep and broad, that they form the largest flat bones in the whole skeleton, while the ilia are the smallest.

The form and position of the scapula and clavicle are the most extraordinary. The former has a most anomalous situation towards the under part of the animal, just behind the abdominal shell; the latter consists of two pieces, joined at an acute angle, to which the humerus is articulated.

Frogs and toads have no real teeth, though the margin of the jaws is denticulated. Their spine is short, and terminates behind in a straight and single bone, which is received into the middle of the somewhat fork-like os innominatum.

They have no ribs; but the dorsal vertebræ are furnished with broad transverse processes. The scapula, which is thin and flat, and a pair of bones, corresponding to the clavicle, are joined to the sternum.

Among the amphibia of the class of lizards, the crocodile may be taken as an example, on account of many remarkable peculiarities in its structure. In no other animal are the jaws of such immense size, in comparison with the extremely small cavity of the cranium. The anterior part of the upper jaw consists of a large intermaxillary bone, and the lateral portions of the lower maxilla are formed of several pieces joined together. The lower jaw is articulated in a peculiar manner in these animals, although the commencement of this kind of articulation is seen in the jaw of the testudines: it has an articular cavity, in which a condyle of the upper jaw is received. The condyle resembles in some measure, the pulley at the inferior extremity of the humerus, the trochlea, or rotula of Albinus.

The old error of supposing that the upper jaw of the crocodile is moveable, and the lower, on the contrary, incapable of motion, which has been adopted even by such anatomists as Vesalius and Columbus, has perhaps arisen from this peculiar mode of articulation; which allows either of these bones to move when the other is fixed.

The numerous teeth of crocodiles have this peculiarity of structure, that in order to facilitate their change, there are always two, of which one is contained within the other.

But the most surprising singularity in the skeleton of the crocodile consists in an abdominal sternum, which is quite different from the thoracic sternum, and extends from the ensiform cartilage to the pubis, apparently for the purpose of supporting the abdominal viscera.

The serpents have an upper jaw, unconnected with the rest of the skull, and more or less moveable of itself.

We find in their teeth the important and clearly defined difference, which distinguishes the poisonous species of serpents from the much more numerous innocuous tribes. See the articles ANGUIS and COLUBER.

It appears, in general, that the number of vertebræ in red-blooded animals, is in an inverse proportion to the size and strength of their external organs of motion. Serpents, therefore, which entirely want these organs, have the most numerous vertebræ; sometimes more than 300.

Of all animals, serpents possess by far the greatest number of ribs; which amount, in some, to 250 pairs. It is necessary to mention here the costæ scapulares of the cobra di capello, (*coluber naïæ*) which enable it to inflate its neck. This is also the case with other species of the coluber; namely, the Egyptian coluber haje, which can dilate its neck very considerably when enraged.

Serpents, with the exception of the *anguis fragilis*, (blind-worm) are the only red-blooded animals which have no sternum.

The two chief divisions of the class amphibia, are distinguished from each other by a remarkable difference in their muscular structure, which arises from a corresponding diversity in the skeleton. In the reptiles, for instance, and particularly in the turtles and frogs, where the trunk of the skeleton possesses but little mobility, the muscles are very few in number. Not only the diaphragm, but also the muscles of the abdomen and chest are wanting in the genus *testudo*. The other muscles are, however, of vast strength in this genus. In the serpents, on the contrary, they are more uniform and thin, and more numerous, beyond all comparison, in consequence of the vast number of vertebræ and ribs, and the want of all external organs of motion.

The muscular system of amphibia has been fully described under SERPENTES and REPTILIA.

At fig. 47, we have the skeleton of a frog (*rana temporaria*); *a*, the parietal bone; *b*, the frontal bone; *c*, the ethmoid; *d*, the superior maxillary bone; *e*, the zygoma; *e*, the intermaxillary bone; *f*, os quadratum; *g*, inferior maxilla; *h*, appendage to the scapula; *i*, scapula; *k*, clavicle; *l*, furcula; *m*, xyphoid cartilage; *n*, sacral vertebræ; *o*, ilium; *p*, coccyx; *q*, symphysis pubis; *r*, *s*, elongated and closely approximated bones analogous to the astragalus and os calcis.

Fig. 32. A view of the muscles on the anterior part of a male frog. Several muscles of the left side are removed; 1, mylohyoideus; 2, hyoglossus; 3, geniohyoideus; 4, sterno-hyoideus; 5, deltoideus; 6, extensor digitorum; 7, supinator; 8, flexor digitorum sublimis; 9, flexor carpi radialis; 10, anconeus; 11, pectoralis minor, or sterno-radialis, as it runs direct from the sternum over a pulley to the radius; 12, pectoralis major; 13, a cutaneous muscle; 14, abdominal portion of the great pectoral muscle; 15, rectus abdominis; 16, obliquus descendens; 17, pronator; 18, flexor carpi radialis; 19, flexor digitorum sublimis; 20, muscles of the thumb (flexor brevis, opponens, adductor pollicis); 21, interossei; 22, pectineus; 23, sartorius; 24, extensor cruris (vasti and rectus femoris); 25, adductor magnus; 26, gracilis; 27, gastrocnemii; 28, soleus; 29, flexor pedis (tibialis anticus); 30, abductor pollicis; 31, flexor digitorum pedis; 32, interossei; 33, semitendinosus; 34, semimembranosus; 35, extensor digitorum pedis.

Fig. 33. Muscles on the posterior surface of the female frog, several being removed on the left side; 36, temporalis; 37, levator scapulae; 38, depressores scapulae; 39, scapularis; 40, obliquus ascendens; 41, quadratus lumborum; 42, glutæus; 43, ischiococcygeus; 44, cutaneous muscle; 45, obliquus descendens; 46, sacro-lumbalis; 47, latissimus dorsi; 48, depressor maxillæ inferioris, being inserted into the process behind the articulation of the lower jaw; 49, abductor pollicis; 50, extensor carpi ulnaris; 51, biceps femoris; 52, iliacus internus (apparently supplying the place of the cruralis); 53, adductor longus; 54, pyriformis; *, the eyes; **, membrana tympani. The remaining references as in the preceding fig. It will be seen how materially the two sexes differ in general form, and in the condition of the muscular system, the thoracic region and the muscles of the anterior extremities being much stronger in the male than in the female.

The skeleton of birds has considerable uniformity in the whole class; and it exhibits, when compared with the variously formed skeletons of mammalia, a very great similarity to that of the human subject.

The skull of birds is distinguished by this peculiarity, that the proper bones of the cranium, at least in the adult animal, are not joined by sutures, but are consolidated as it were into a single piece.

Birds have, without exception, only a single condyle, placed at the anterior margin of the great occipital foramen.

There is also, in the whole class, a bone of a somewhat square figure (called by the French *os carré*), by which the lower jaw is articulated with the cranium on both sides, in the neighbourhood of the ear.

The ossa unguis are common to birds with mammalia, but appear to be more general in the former than in the latter: they are of considerable size, and must be distinguished from the superciliary bones which probably belong to the *accipitres*, or predacious birds, only.

The jaws are wholly destitute of teeth. The superior maxilla, which is completely immoveable in mammalia, has, with a few exceptions, more or less motion in birds. It either constitutes a particular bone, distinct from the rest of the cranium, to which it is articulated, as in the psittaci (birds of the parrot kind); or it is connected into one piece with the cranium, by means of yielding and elastic bony plates; as is the case with birds in general. It is quite immoveable in very few instances; as in the rhinoceros bird.

The bill is of extraordinary hardness in birds which tear their prey, as in eagles, or in those which have to bruise hard fruits, as parrots, or in those which penetrate the bark of trees, as the woodpecker, nuthatch, &c.

This hardness is gradually diminished in those which take less solid nourishment, or which swallow their food whole; and the bill becomes a portion of nearly soft skin in those which require a sense of feeling in the part to enable them to obtain their food in mud, or water, as in ducks, woodcocks, snipes, &c.

One of the peculiar characteristic differences of the cranium of birds when compared to each other, consists in the mode of separation of the orbits, which are of great size in the whole class. In some they are separated by a membranous partition only; in others by a more or less complete bony septum. The relation which the nasal and palatine openings bear to the upper jaw varies much, even in the different species of the same genus. They are small in the stork, and on the contrary, so large in the crane, that the longest portion of the jaw appears to consist merely of three thin portions of bone, placed far apart from each other, and converging towards the point of the bill.

The want of motion in the back of birds, (their dorsal vertebræ have the spinous, and even the transverse processes, often ankylosed) is compensated by a large number, and greater mobility of the cervical vertebræ; of which, to quote a few instances, the raven has 12, the cock 13, the ostrich 18, the stork 19, and the swan 23.

The trunk of birds has fewer cartilaginous parts than the corresponding division of the skeleton in mammalia. That part of the spine which belongs to the trunk is short and rigid, and has no true lumbar vertebræ. Neither has any bird an os coccygis prolonged into a true jointed tail.

The length of the neck increases generally in proportion to that of the legs; but in aquatic birds in a much greater proportion, since they have to seek their food below the surface of the water on which they swim.

The cervical vertebræ are not articulated by plane surfaces, but by cylindrical eminences, which admit a more extensive motion, as they constitute real joints, instead of synchondroses. Four or five of the upper pieces only bend forwards, while the lower ones are confined to flexion backwards. Hence the neck of a bird acquires that double bend, which makes it resemble the letter S. It is by rendering the two curvatures more convex, or more straight, that the neck is shortened or elongated. The great mobility of the neck enables birds to touch every point of their own body with the bill, and thus to supply the want of the prehensile faculty of the superior extremity. The atlas has the form of a small ring, which articulates with the head by only one surface. In proportion to the mobility of the neck of birds is the fixed state of the dorsal vertebræ, which are connected together by strong ligaments. The greater part of their spinous processes are consolidated into a single piece, which runs like a ridge along the whole back. The transverse processes terminate in two points, one directed anteriorly, the other posteriorly; they meet those of the two other classes of vertebræ, sometimes ankylosing with them, as the spinous processes do with each other. This structure is necessary to give steadiness to the trunk in the violent motions required by the action of flying.

The pelvis of birds is chiefly formed by a broad and simple os innominatum; the lateral portions of which are of different figures in the several genera; but instead of uniting below to constitute a symphysis pubis, they are quite distant from each other. The ostrich alone forms a remarkable exception to this rule, inasmuch as its pelvis, like that of most quadrupeds, is closed below by a complete junction of the ossa pubis.

Birds have fewer ribs than mammalia; the number never exceeds ten pairs. The false ribs, *i. e.* those which do not reach to the sternum, are directed forward; the true ones are joined to the margin of the sternum by means of small inter-mediate bones. The middle pairs are distinguished by a peculiar flat process, which is directed upwards and backwards.

The sternum of these animals is prolonged below into a vertical process, (crista) for the attachment of the strong pectoral muscles. In the male wild swan (*anas cygnus*) and in some species of the genus *ardea*, as the crane, this part forms a peculiar cavity for the reception of a considerable portion of the tracheæ. The crista is entirely wanting in the ostrich and cassowary; where the sternum presents a plane and uniformly arched surface. This peculiarity of structure is accounted for by observing, that these birds have not the power of flying. The wings, which are very small, assist in balancing the body as they run.

The wings are connected to the trunk by means of three remarkable bones. The clavicles, which are always strong, constitute straight cylindrical bones. Their anterior extremities are connected to the sternum by means of a bone peculiar to birds; viz. the fork-like bone, or, as it is more commonly termed, the merry thought. The ostrich and cassowary have indeed no separate furcula; but on either side of the front of the chest an elongated flat bone, consisting of a rudiment of the furcula, with the clavicle and scapula consolidated into one piece.

The bones of the wing may be compared on the whole to those of the upper extremity in man, or the quadrumana; and consist generally of an os humeri; two bones of the fore-arm; two of the carpus; two, which are generally consolidated together, of the metacarpus; one bone of the thumb; and two fingers; of which that which lies towards the thumb, consists of two phalanges, the other only of one. The most remarkable deviation from this structure is found in the fin-like wings of the penguin.

The bony structure of the lower extremities is more simple in birds than in mammalia. In general it comprehends only the following bones, viz. the femur, the tibia, (to which, in some, is added a small, thin, closely adhering pointed fibula, that is separate in early life only), one metatarsal bone, and the toes. On the metatarsal bone of the domestic cock and other birds of the gallinaceous tribe, the spur is situated. The place of the patella is supplied, in many cases, by a process of the tibia. The tibia is immediately articulated with the metatarsus. There is, in most of this class, a peculiar progressive increase in the number of phalanges of the toes: the great toe has two; the next, three; the middle one, four; and the outer one, five.

Fig. 34. Skeleton of a falcon (*falco nisus*): *f*, cavity of the tympanum; *h*, orbit; *l*, superciliary process and bone; *m*, os quadratum; *n*, zygoia; *o*, scapulæ; *p*, os humero-capsulare; *q*, head of the clavicle of the right side, that of the left being concealed by the humerus; *r*, furcula; *s*, sternum; *t*, radius; *u*, ulna; *v*, the thumb; *w*, the metacarpal bone of the little, and *x* of the great finger of the wing; *y*, the little finger; *z*, the first, and *a*, the second phalanx of the great finger; *b*, aperture for the admission of air into the humerus; *c*, the upper, and *c**, the lower iliac processes of the dorsal vertebræ; *d*, the ileum; *e*, the ischium; *e**, the ischiatic foramen; *g*, the os pubis; *h*, the last caudal vertebræ; *i*, tibia; *a*, fibula; *b*, tarsus and metatarsus.

The muscles in this class are distinguished by possessing a comparatively weak irritable power, which is soon lost after death; and by their tendons becoming ossified, as the animal grows old, particularly in the extremities, but sometimes also in the trunk.

Birds possess three pectoral muscles, arising chiefly from their enormous sternum, and acting on the head of the humerus. The first, or great pectoral, weighs, of itself, more than all the other muscles of the bird together. The keel of the sternum, the fork, and the last ribs, give origin to it; and it is inserted in a rough projecting line of the humerus. By depressing that bone, it produces the strong and violent motions of the wing, which carry the body forwards in flying. The middle pectoral lies under this; and sends its tendon over the junction of the fork, with the clavicle and scapula, as in a pulley, to be inserted in the upper part of the humerus; which bone it elevates. By this contrivance of the pulley, the elevator of the wing is placed at the under surface of the body. The third, or lesser pectoral muscle, has the same effect with the great pectoral, in depressing the wing.

One of the flexor tendons of the toes of birds (produced from a muscle which comes from the pubis) runs in front of the knee; and all these tendons go behind the heel; hence the flexion of the knee and heel produces mechanically a bent state of the toes, which may be seen in the dead bird; and it is by means of this structure that the bird is supported, when roosting, without any muscular action.

This circumstance of the flexion of the toes accompanying that of the other joints of the lower extremity of birds, was long ago observed by Borelli, and justly attributed by him to the connexion which the flexors of the toes have with the upper parts of the limb, by which they are mechanically stretched when the knee is bent.

Fig. 35. Muscles of the falco nisus; a, biventer cervicis; b, trachelo-occipitalis; c, trachelo-mastoideus; d, cervicalis descendens; e, longus colli; f, sterno-mastoideus; g, mylohyoideus; h, conicus ossis hyoidei; i, temporalis; k, levator coccygis; l, lateralis coccygis posterior; m, depressor coccygis; n, o, lateralis coccygis anterior; p, femoro-coccygeus; *, os pubis; q, multifidus spinæ; r, levator costæ; s, serratus anticus major; t, costo-scapularis; u, v, latissimus dorsi; w, trapezius; x, rhomboideus; y, pectoralis major; z, pectoralis minor; a, teres; b, tensor fasciæ-antibrachii; c, deltoideus; d, biceps; e, anconæi; f, adductor carpi radialis; g, ulnaris; h, adductor carpi ulnaris; i, abductor digitorum; k, abductor externus digiti maximi; l, vastus externus; m, biceps femoris; n, semi tendinosus; o, rectus femoris; p, glutæus medius; q, gemelli; r, extensor metatarsi externus; s, flexor digitorum; w, accessory flexor of the toes, the tendon of which passes over the knee; 1, the œsophagus; 2, the trachea; 3, the os hyoideus; 4, the clavicle; 5, the furcula; 6, the scapula; 7, the humerus; 8, the sternum; 9, ulna; 10, radius.

The skeletons of the different mammalia, particularly the four-footed ones, vary considerably; yet these varieties may be included, at least for the greatest part, under the following peculiarities; which serve to distinguish their skeletons from those of birds.

The skeletons of mammalia possess:

1. A skull with genuine sutures (at least with very few exceptions; as perhaps the elephant, and the duck-billed animal, ornithorhynchus).
2. Jaws furnished with teeth; except the ant-eaters, the manis, the duck-billed animal, the balæna (whale).
3. An immoveable upper jaw.
4. An os intermaxillare.
5. Two occipital condyles.
6. Seven cervical vertebræ; except the three-toed sloth, and some cetacea.
7. Moveable dorsal vertebræ.
8. A pelvis closed in front; except the ant-eaters; which have it open; and the cetacea, which have none.
9. True clavicles in a few genera only.

The number of proper bones of the cranium is, on the whole, the same as in the human subject. The os frontis, however, in most of the horned animals, is composed of two equal portions; in many of these the two parietal bones are consolidated into one, and in others they are

united to the occiput. Some of the digitata have a peculiar flat bone situated transversely between the parietal and occipital bones.

As the forehead of man is peculiarly distinguished by the beauty of its convex superficies, so is that of many of the quadrumana, as the larger animals of the monkey tribe, papio mormon, &c. by the large flat triangular surface into which it is compressed, and the sides of which converge from the processus malares at the external angles of the orbits, obliquely backwards, towards the crista occipitalis.

A principal variation in the form of the cranium arises from the size and direction of the crista occipitalis, which bears a determinate proportion to the strength of the jaws.

The situation and direction of the great occipital foramen are attended with remarkable variations in some instances. Instead of being situated far more anteriorly, and for the most part horizontally, as in the human subject, (in which indeed the anterior margin is sometimes higher than the posterior,) it is placed, in most quadrupeds, at the base of the cranium, and obliquely, with the posterior border more or less turned upwards. In some, indeed, its direction is completely vertical; and in the marmot of the Alps its upper margin is turned more forwards than the lower.

The true sutures, which connect the individual bones of the cranium, are generally less intricate, at least to outward appearance, in quadrupeds than in man. Their indentations are very strong and sharp in the horned pecora, for obvious reasons; and the frontal bones are thick in the same animals. The ossicula wormiana are seldom seen in the crania of animals, yet Blumenbach has specimens of these in the hare and a young orang-outang.

The general form of the cranium is most materially influenced by the direction, and the various degrees of prominence of the facial bones. The projection is generally formed by a prolongation of the upper jaw; partly also, and in many instances chiefly, by the os intermaxillare, which is inclosed between the two upper jaw-bones. See for a more full account of this difference the articles MAN, PHYSIOLOGY, and PHYSIOGNOMY.

The upper jaw-bones of other mammalia do not, as in man, touch each other under the nose, and contain all the upper teeth; but they are separated by a peculiar single or double intermaxillary bone, which is in a manner locked between the former, and holds the incisor teeth of such animals as are provided with these teeth.

The want of the os intermaxillare has been regarded as a chief characteristic of the human subject; as one of the leading circumstances which distinguish man from other mammalia.

That all other mammalia possess this bone, is not quite so clear as that it is wanting in man. The exceptions occur in the quadrumana: as the orang-outang for example.

The anterior palatine holes, or foramina incisiva are double in most mammalia, as in man. They are much larger in quadrupeds than in the human subject: in the pecora and the hare they are remarkably long and broad.

In the zygoma we observe several important differences, immediately derived from the organs of mastication. It is of immense strength, and includes a large space towards the cranium, for lodging the powerful muscles which move the lower jaw, in several carnivorous animals, as the tiger, and in some glires, as the beaver. It is wanting in the ant-eater, in which the temporal and malar bones have only a slight projection instead of the usual zygomatic process. This circumstance is sufficiently explained by the want of teeth, and the consequent want of mastication.

The elephant possesses only a rudiment of the nasal bones. In most apes, and even in the orang-outang, there is a single, triangular, and very small nasal bone. In the greater number of true quadrupeds, there are two ossa nasi, frequently of very considerable magnitude. This is the case in the pecora and hare; also in the horse, pig, &c. In the rhinoceros, the ossa nasi, which support the horn, are very soon consolidated together.

In mammalia which have horns, these parts grow on particular

ticular processes of certain bones of the cranium. In the one-horned rhinoceros they adhere to a rough, and slightly elevated surface of the vast nasal bone. The front horn of the two-horned species has a similar attachment; the posterior rests on the os frontis; as those of the horned peccora do. Two kinds of structure are observed in the latter: there are either proper horns, as in the genera of the ox, goat, and antelope, or bony productions, as in the genus cervus, which includes animals of the deer kind. See the articles BOS and CERVUS.

We have not supplied any plates of the skeleton and muscular system of the mammalia, several very fine plates being already in the body of the work. See, for example, FARRIERY.

In treating of the nervous system, we shall commence with an account of its anatomy, without any reference to its functions, and shall conclude with some speculations as to its physiology. For the first part, we shall content ourselves with a condensation of what is said by Carus and Desmoulin:

As to the *form* of the nervous system, the first point to be noticed is, that the appearance which it first assumes is a circle around the œsophagus, which constitutes its most uniform and fundamental portion. The farther development of this fundamental type appears to correspond to the diversity of the general organization, and, in accordance with it, to take one of three directions. In the first, the nervous ring receives considerable additions to its bulk by the formation of larger ganglia in its substance, which gradually approximate more and more to each other on the superior side of the animal, the situation most peculiarly assigned to the nervous mass; such is the case in the *mollusca*. Secondly, in the *articulated* worms, &c., the jointed form of the body is accompanied by a multiplication of the nervous rings surrounding the alimentary canal; and the ganglia of these generally imperfect rings being connected together in a continued chain on the abdominal surface: or, thirdly, in insects, the development of the nervous system takes place in both the preceding ways, *i. e.*, capitably and longitudinally.

51. A, the under surface of an asterias, the rays being cut away: a, nervous circle around the mouth; b, the smaller; c, central larger nervous branches to the rays of the body; B, lobes of the liver from a ray of the asterias *rubus*; C, cluster-shaped ovary from the same.

In the fresh-water muscle (*mya pictorum*) it is always easy to distinguish the nervous system, after the animal has been macerated a few days in spirit of wine. Here, also, we find a nervous ring loosely surrounding the short œsophagus, with two ganglia of considerable size on each side; these send two long fibres backwards over the gills, which combine to form a large ganglion in that situation. The fourth and most considerable ganglion, however, first described by Mangili, is seated in the substance of the foot, beneath the ovary, being the lowest ganglion of the nervous ring on the abdominal surface; the superior one corresponding to the brain in the higher classes of animals being deficient.

In the figures 36 and 37 we have representations of the brain and senses in the snail: in fig 36, the horns are marked 1, 2, 3, 4; their muscles *aa* and *bb*; *cc* denote the muscles retracting the lips; and the brain, *d*, is composed of two spherical lobes, placed on the anterior part of the head when the animal is moving, but which can be retracted by muscles along with the mouth *g*, stomach *h*, salivary vessels *ii*, into the interior of the animal. We shall describe it as it exists in the fore part of the head. The optic nerves arise from the front of these globes, and make many spiral turns, *n*, before they arrive at the extremity of the larger horns, a disposition evidently for the purpose of allowing the retraction and advancement of the brain; *ll* indicate slender ligaments which defend the nerve; *m* and *o*, a muscle which moves its envelope. The nerve terminates by a swelling at *p*, which is finally surmounted by the eye, *q*: *r* indicates the nerves which go to the extremities of the smaller horns; they are contorted like the optic, but differ from them in the two circumstances, that

they are not surmounted by eyes, nor arise directly from the brain. They arise from two nerves, *s*, that supply the roots of the smaller horns. The roots of the larger horns are supplied by nerves marked *t*; *u* indicates the muscles which move the throat and mouth, which are also represented at *h* in fig. 37, where we may perceive how they become folded when the brain is advanced.

In fig. 37, *a* marks the parts of the throat, stomach, and palate. The stomach, *b*, is cut off to shew the brain, *c*; *dd* are two columns of the spinal chord, which leave an interval between them for the passage of the stomach; they unite and form a ganglion, *e*, which gives off all the nerves of the lower part of the body, *viz.*, nerves of the organs of generation, *p*; of the skin and muscles of these parts, *q*; of the muscles of the sides, *rr*. A long nerve from the right side of the ganglion passes, accompanied by a muscle, to the ovary, *s*. Two other nerves arise behind this: one accompanies it, the other, *t*, passes to a transverse muscle, situated on the limbus; *u* marks a similar nerve on the left side, which goes to the left and under side of the body; *y y y*, the nerves on the left going to the side; *z z*, their antagonists on the right, cut off.

At fig 39 is represented the nervous system in a sepia.

Fig. 55. Pl. IV. A leech (*hirudo medicinalis*), opened longitudinally, together with the intestinal canal, from the dorsal side: a, the sucking surface of the mouth; b, the cavity of the mouth opened, with an internal view of its triangular aperture; c, muscles of the pharynx; d, cavity of the pharynx; e, the cerebral ganglion above it; f, the perforated septum of the stomach; g, the chain of ganglia; h, respiratory vesicles; i, the lateral vessel; k, the pylorus; l, dilatation at the commencement of the intestine; m, the intestine; n, the anus: o, the anal sucking surface; p, the cavity of the stomach; q, the cœca; r, the female, s, the male genital organ.

55. Pl. V. A portion of the chain of ganglia, from the anterior part of the body of the same.

At fig. 39, we have engraved the nervous system of the *sœpia octopus*; a, the brain, composed of two lobes; b, the fat that encloses it, and is enclosed by a cartilaginous cup; c, the optic nerves, partly covered with fat; d, ganglia formed on them, which give rise to several nerves, *e e*, which are distributed to the eye; f, a vessel they enclose; g, fibrils that embrace the choroid coat, and perhaps form it; h, a spherical enlargement, on which is situated the crystalline lens; i, the fore-part of the brain gives out three pairs of nerves, 1, 2, 3, distributed to the head, feet, and adjacent parts: on the middle one a ganglion, *n*, is situated. The hinder part of the brain sends off two large nerves, *q*, which pierce the thorax, pass under the muscles that move the two concave bodies of the excretory sac, and each forms a ganglion, *rr*, whence many other nerves arise which are distributed to the stigmata.

The unmarked figure, in Plate V., shews the cartilage of the head, cerebral ganglion, &c. of the *sœpia officinalis*; a, the cerebral ganglion; b, nervous collar around the œsophagus (*c*); d, optic nerves; e, their ganglia and ramifications; f, the eye; g, h, nerves of the viscera and cloak; h, little auditory sac, with the auditory nerve; i, cavity of the labyrinth in the cartilage of the head (*l*); m, the orbits.

Fig. 38 represents the nervous system of the louse, in which the medulla oblongata is seen as a striated body through the skin: *aaa*, three remarkable swellings in the spinal chord, whence arise three nerves, *bbb*, which go to the muscles of the six feet; *cc*, other nerves that supply the viscera. The last swelling of the spinal chord differs little from the others; it is thickly covered with tracheæ. The cerebral end of the spinal chord is a very thin thread, *e*; thus differing from what is found in other insects, who have this part always divided into two and threaded by the œsophagus. The brain, *ff*, is of the form of two round pears joined to each other by the larger ends. It is studded with tracheæ, *gg*, and fatty particles, which render its demonstration difficult on account of their close adhesions; *hh* are the optic nerves; *ii*, the eyes.

Fig. 40 represents the spinal marrow of a *bee*: a, the superior

rior ganglion, which forms the under surface of the brain, and which receives the optic nerves; *bbb*, the seven ganglia that give off nerves in the thorax and abdomen; *ccc*, nerves, which arise from the threads that connect these ganglia; *dd*, their double or separated threads; *e*, the conical portion of the spinal chord, which is enclosed in a contracted piece of shell; *f*, the thoracic portion of the spinal chord, which furnishes nerves to the muscles of the legs and wings; *g*, the part of the spinal chord enclosed in that strangulating scale that separates the thorax from the abdomen; *h*, the abdominal portion of the chord, which gives origin to the nerves that supply the muscles of the abdominal rings and the sting; *ii*, two nerves passing to the jaws; *kk*, two nerves going to the proboscis [Swammerdam conjectures these may be for taste]; *ll*, two nerves that supply the muscles of the proboscis; *mm*, the optic nerves; *nn*, two nerves which pass from the thoracic portion of the spinal chord through the scaly strangulation, with the medulla itself, and which are distributed to the muscles on the dorsum of the abdomen. The ganglia are firmer and more striated in this animal's spinal chord than the chord itself, and are also more amply supplied with tracheæ, according to the observations of Swammerdam on bees. Malpighi says the same of the silkworm.

Fig. 41 represents the spinal chord of an ephemera, formed of a series of ganglia, answering to the annular rings of the body, united to each other by two columns of spinal marrow, and sending off nerves; the foremost ganglion forming the brain and receiving the optic nerves.

At figs. 42 and 44, we have representations of the brain in the scarabæus monoceros: *a*, the brain, composed of two hemispheres, its front part sending off four small nerves; *b*, two large nerves sent off posteriorly, which run round the œsophagus, unite, and form a ganglion; from this a continued spinal chord descends, dotted with fourteen ganglia. Nerves that pass to the whole body of the insects issue symmetrically from this medulla.

Fig. 42. *ii*, the brain, formed of two lobes, and studded with tracheæ; *k*, the optic nerves, of large size altogether, are somewhat contracted where they pass off from the brain at *ll*, but dilate considerably at *mm*; they retract again at *nn*, but form, ultimately, a large swelling at *o*, where they become invested by the internal parts of the eye.

Fig. 59. A male cray-fish (*astacus fluviatilis*), opened from above; the viscera are removed, the tail is cut away, with the exception of the chain of ganglia. The canal in which the chain is lodged above the legs, and formed by the horny laminæ, to which the legs are attached (a kind of vertebral canal, though placed on the abdominal surface), is, for the most part, broken away, so as to expose the whole extent of the central part of the nervous system: *a*, the œsophagus, cut through immediately behind the triangular mouth; *b*, the cerebral ganglion; *c*, the nervous collar of the neck, with a pair of nerves arising from each side; the remaining eleven ganglia are designated by figures; *d*, the bony pedicle and muscles of the mandibulæ; *e*, the eyes; *f*, the horny laminæ forming the canal for the chain of abdominal ganglia; *g*, a part of this canal not broken open; *h*, the lower extremities of the seminal ducts.

Of the nervous system in fishes.—With respect to the two divisions of the great nervous central mass in this class, the superiority of bulk is constantly on the side of the spinal marrow, which stretches, with few exceptions, through the whole extent of the vertebral column, and consequently, which is not the case in superior animals, through the caudal vertebræ; whence, from the great number of vertebræ, it attains a remarkable length. According to Arsaky, the spinal marrow is peculiarly short, in proportion to the vertebral canal, in some cartilaginous fishes, as the tetrodon *mola* and lophius *piscatorius*, the nerves belonging to it forming a kind of cauda equina, as in man. In the lampreys (*petromyzon marinus*, *fluviatilis*, and *branchialis*), the spinal marrow differs from that of all other vertebral animals. In them the inferior of the two grooves of the spinal marrow expands so much immediately below the brain, that the former assumes a complete riband-like appearance, and the canal usually

contained within it totally disappears. The spinal marrow of fishes terminates in a single thread, and usually at the last caudal vertebræ. Its nerves arise by superior and inferior roots, of which the latter are detached somewhat more posteriorly (caudally) than the former. As in man, it is only on the inferior roots that small ganglia are found. The superior are connected with the inferior roots externally to the vertebral canal; which, particularly in the osseous fishes, is but imperfectly closed by the slender arches supporting the spinous processes. In those situations where large nerves arise from the spinal marrow, distinct swellings, or enlargements of the latter, are distinctly visible; an observation which applies to the remarkably curtailed spinal marrow in the sun fish and frog fish, as well as to the upper portion of the spinal marrow in a species of flying fish, (*trigla*) in which the pectoral fins are developed in an unusual degree, and each of the pairs of nerves belonging to it, corresponds to a pair of ganglia on the upper side of the spinal marrow. The brain also, in fishes, is little else than a similar series of pairs of ganglia on the upper side of the medullary cord; and as by this arrangement the individual portions of the brain are *behind*, and not below each other, the form of the whole recedes much from the spherical shape of the perfectly developed brain of man. The size of the brain also, is very inconsiderable; and that with relation as well to the spinal marrow as to the whole body.

As to the diversified conformation of the brain in fishes, we shall be best able to trace it by means of the variations which the separate masses composing it undergo in different genera. The cerebral mass from whence the olfactory nerves proceed, Carus distinguishes as the *first cerebral mass*. In the osseous fishes it is very inferior in point of structure, and frequently also in size, to the other portions of the brain. In the eel genus it presents three or four pair of ganglia, which successively diminish in size as they advance forwards, and of which the posterior and largest pair are connected, here as in other instances, by a small commissure. The olfactory nerves are usually slender, except in the conger-eel, (*muræna conger*) in which each divides into two tolerably thick branches. In other osseous fishes, this portion of the brain is composed of one or more pairs of ganglia. The latter consists almost entirely of grey substance, and have no cavity within them. In the cartilaginous fishes, we observe changes in the first cerebral mass, by which means it approximates to the form of the hemispheres of the mammalia. The *middle cerebral mass* is distinguished in the osseous fishes by the perfection of its internal structure, and by the greater quantity of fibrous matter contained within it: it consists on the dorsal surface of the brain of a pair of ganglia, which are frequently nearly consolidated into one. Within this is contained a spacious cavity, into which again some other ganglia are found projecting. These parts collectively should be viewed as true optic tubercles, *i. e.* as identical with the corpora quadrigemina in man. From the covering of the cavity of these optic tubercles, arises on each side the broad, ribbon-like, optic nerve, which is generally evidently disposed in numerous folds. With a few, as in the soles and cod, the right optic nerve passes to the left side, and the left over it to the right, without however forming a perfect decussation, although they are connected by a commissure at their origin. From the middle cerebral mass also arise the accessory cords of the optic nerve, *viz.* the third pair from the great internal ganglion of the cavity of the optic tubercle; the fourth pair from the medullary lamella (valve of the brain) connecting the optic tubercle with the third cerebral mass; and the sixth pair from the medulla oblongata, immediately below the fourth, as the third is below the second pair. The identity of this middle cerebral mass with the corpora quadrigemina, is fully proved by a reference to the progress of formation of the same parts in the fetus of man and other mammalia.

The inferior surface of the middle cerebral mass presents some elevations of gray substance, corresponding precisely to the gray substance about the infundibulum in the human brain. The conformation of the middle cerebral mass is remarkably distinct in the thoracici and abdominales. In the eel

eel genus, on the contrary, the optic tubercles are smaller and less developed internally. This is still more the case in the rays and sharks.

The most uniform and most essential part of the *third cerebral mass*, is a single ganglion, principally composed of gray substance, and which may be considered as the prototype of the cerebellum. It always lies immediately behind the optic tubercles, is usually of a rounded shape, and contains a cavity which is continuous with the general cerebral cavity formed by the divergence of the upper columns of the spinal marrow, and the expansion of the canal contained within it. Its formation is thus simple in the eel for instance. In other fishes there are lateral appendages to this ganglion; small in the pike, larger in the haddock. Occasionally also there is a second zygous ganglion below it, as in the carp and cobitis *fossilis*. Lastly, there are occasionally two other ganglia behind it, which then are principally connected with the origin of the branchial nerve; as in the carp, cobitis *fossilis*, and herring.

The circumstances connected with the *third cerebral mass* in cartilaginous fishes, are peculiarly remarkable; for here the ganglion of which it consists, and which as regards its character, corresponds to the cerebellum, more evidently presents the structure that it possesses in man. Thus, in rays and sharks, we find it is a simple medullary lamella, covering the fourth cavity of the brain; and in several of the latter, not only of considerable extent, but also disposed in transverse folds; in which respect it coincides more particularly with the cerebellum of birds, hereafter to be described. The medulla oblongata is divided superiorly, as in man, so as to form the fourth ventricle; inferiorly it is flattened, and of considerable breadth.

The nerves that come from the brain in fishes, are the olfactory, which frequently form a ganglion previous to their termination. The optic, which are usually developed in proportion to the optic tubercles and the eyes; the third and fourth and sixth pairs, the origins of which we have described. (The fifth pair, and the par vagum, are distinctly recognisable as pairs of nerves passing out between two vertebræ, like those of the spine; the former passing between the anterior and middle, the latter between the middle and posterior, cranial vertebræ.) The branchial nerve is usually of considerable size in fishes, and is ordinarily distributed in three particular directions. The anterior, and thicker branches, proceed to the respiratory organs, placed immediately below the head; a twig divided into two fibrils being distributed to each lamina of the gills. The middle branches are destined chiefly for the neighbouring muscles. The third posterior branch, lastly, proceeds directly outwards, and then runs along the sides of the body, immediately below the skin, forming a lateral line, visible externally; an arrangement of which the distribution of the accessory nerve in man, appears to form a repetition. The auditory nerves, though in immediate opposition with nerves of the fifth pair at their origin, are distinct from them, according to Desmoulins, in all species of fishes, except rays. A similar statement is made by Rudolphi, as regards the sturgeon; and by Weber as to lampreys, and certain osseous and cartilaginous fishes. In many fishes there is an accessory auditory nerve corresponding to the facial, arising either directly from the brain, or from the auditory and maxillary nerves, and distributed partly to the internal ear, and partly to the muscles of the branchial apparatus, os hyoides, &c. The nerve which supplies the place of the glosso-pharyngeal in fishes, is a division of the vagus nerve, given off from the first of the branchial nerves. On the other hand, that which corresponds to the hypoglossal, is a branch of the maxillary or fifth pair of nerves, and, according to Weber, has also, in the cyprini, an additional origin from the medulla oblongata.

As to the spinal nerves, from the absence of proper extremities, are distributed in a very simple manner, between the ribs and the long spinous processes. In lampreys, they are extraordinarily small, which appears to be connected with the deficiency of ribs and fins; whilst on the contrary, in other cases, where the fins are highly developed, the bulk of

the nerves is increased in a corresponding degree. This is particularly evident in rays; in which the bones of the shoulder and pelvis, as well as the pectoral and abdominal fins, are highly developed. Whilst in osseous fishes only the two first spinal nerves on each side unite for the supply of the pectoral fins, in the rays the first twenty-four pairs are united together, within a cartilaginous canal, into a broad band, a kind of axillary plexus, for the supply of the same parts.

In all of the four superior classes of animals, there is a nervous chord on each side of the front of the vertebral column, the office of which appears to be to connect together the branches from the spinal marrow, destined for the organs of vegetative life, and to combine them into a general system, forming the medium for the mutual influence of the animal and vegetative spheres. Hence, it is necessarily connected with the nerves of the spine, as well as with the intervertebral nerves of the head: the fifth is the only pair of cerebral nerves with which it is connected in them. In the cyclopterus *lumpus* the internal filaments of the third ganglion, form an arch under the first vertebra, from which proceeds a fasciculus, passing along the œsophagus to the stomach, liver, and commencement of the intestine. A similar fasciculus arises from the eleventh ganglion, and is distributed to the ovary. The remaining ganglia are much smaller, and accompany the aorta and venæ cavae, in the sub-vertebral canal. One of the most remarkable circumstances however, is, that, according to Desmoulins, the nerves of the sympathetic system are much less intimately connected with the arteries in fishes, than in the superior classes of animals.

As an example of the parts in question, in osseous fishes, we have represented at fig. 45, the brain and spinal marrow of the cyprinus alburnus, viewed from above; *a*, the ganglia of the olfactory nerves, or first cerebral mass; *b*, optic tubercles; *c*, cerebellum; *d*, the medulla oblongata. As far as *x*, the spinal chord is lodged within the dorsal vertebra, and after *x*, in the caudal; *u*, the olfactory nerves; 5, the fifth pair.

Fig. 49 shews the basis of the brain in another osseous fish, the cyprinus barbus; *c*, is the medulla spinalis; *h*, medulla oblongata; *A B*, the optic lobe; *D D*, the cerebral hemispheres; *E*, the olfactory lobe; 2, the optic nerve; 3, the third pair; 45, the fifth nerves, formed of separate fibrils; 7, the facial nerve; 8, the auditory nerve; 9, the glosso-pharyngeal; 10, the pneumo-gastric; 11, the hypoglossal; 12, the accessory; *a a*, the cerebellum.

Fig. 50 represents the upper surface of the same brain: 1, the cerebellum; 2, the optic lobes; 3, the cerebral hemispheres; *i i*, the olfactory lobe; *m*, its pedicle; *b b*, the hypoglossal nerve; *l*, the glosso-pharyngeal; *c*, the pneumo-gastric nerve; *D*, auditory; *E*, facial; *A A*, fourth pair; *G, H, I*, nervus trigeminus; *K*, third pair; *L*, optic nerve; *N O*, anterior branch of trigemini.

Fig. 48 represents the nervous system in a cartilaginous fish, viz. the upper surface of the brain; the *raia rubus*; 1, medulla spinalis; 1, *bis* corpus restiforme; 2, colonus scriptorius; 3 and 4, middle lobe of the cerebellum; 4, *bis*, and 9, lateral lobes; 5, fifth and seventh nerves united; 6, the fourth nerve; 7, optic lobe; 8, third nerve; 13, 14, the cerebral hemispheres; 10, 11, the optic nerve; 16, pedicles of the olfactory ganglion; 17, the ganglion itself.

In the class amphibia the two main divisions of the great central nervous mass are still pretty nearly similar; for, although the brain is somewhat more developed than in fishes, the spinal marrow preponderates considerably in point of size. In salamanders, serpents, and lizards, as in fishes, the spinal marrow extends through the whole spine, even to the caudal vertebræ, and is, consequently, of considerable length. In the frog, its fibres terminate at the sacrum. The form of the spinal marrow does not vary essentially from that observed in the preceding class. In the frog, the fourth ventricle extends pretty low into the spinal marrow. Here, also, as in fishes, the principal divisions of the brain are placed one behind another, and its form coincides most completely with that of the brain of cartilaginous fishes, particularly rays

rays and sharks. The bulk of the whole brain is very inconsiderable. As to the form of the individual portions of the brain, we find the *first cerebral mass* here, as in the following classes, constantly provided with the cavity which was first developed in the shark. In the salamander and frog it is tolerably elongated; and in the latter the two ganglia are, as well as their cavities, united into one, whilst, posteriorly, they are connected by a medullary band. Within each of the cavities corresponding to the lateral ventricles of the human brain, there is here, as well as in all other amphibia, a swelling very similar to the corpus striatum of man.

In the *second cerebral mass* we find the optic tubercles smaller, and with a more simple cavity; partly forming a repetition of the type of rays and sharks, and partly approximating to the form of the anterior pair of the corpora quadrigemina in man. Besides the proper optic tubercles, however, there is, in all the orders of this class, a pair of smaller ganglia placed before them, which correspond to the optic thalami, as they are usually called, or ganglia of the hemispheres, in the brain of man, and, like them, give some fibres to the optic nerves. The true optic tubercles are usually consolidated into one mass; and, in the frog, as in osseous fishes, contain a swelling, from which the medullary fibres radiate to the covering of the tubercles. In tortoises, lizards, and serpents, the cavity of the optic tubercles is smooth. A small pineal gland is always found on the ganglia of the hemispheres.

The *third cerebral mass* consisting of the cerebellum and medulla oblongata, is very simple in frogs and serpents. The cerebellum forms only a narrow medullary band, covering the fourth ventricle; to the back part of it a vascular lamina is attached, forming, as in the lamprey, the choroid process of the fourth ventricle, which, in serpents, is very small. The nerves are distributed in the same manner as in man; those only, as must evidently be the case, being absent, which correspond to organs not yet in existence; e. g. phrenic nerves, because there is no diaphragm; nerves of the pelvis and extremities in serpents, because those parts are wanting. Of the cerebral nerves, the maxillary and vagus are still distinctly recognisable as the intervertebral nerves of the head. The auditory is a separate cerebral nerve, in this class of animals, and of considerable size in tortoises and lizards. The optic nerves also are large, when the eye is pretty much developed, as in tortoises, the iguana, &c. In the latter, a transverse incision at the commissure of the optic nerves, clearly proves their decussation by the mutual interlacement of medullary laminae. The olfactory nerves are but short in serpents, terminate in a club-like swelling, and, in most amphibia, appear as uninterrupted prolongations of the first cerebral lobes.

The sympathetic nerve has nearly the same course in amphibia as in fishes.

52. The brain of the coluber haje; Nos. 1, 2, medulla spinalis; 3, the cerebellum; 5, optic lobes; 6, the pineal gland, and posterior part of the hemispheres; 7, anterior part of the hemispheres; 8, olfactory pedicle; 9, olfactory lobule.

In *birds* the brain and spinal marrow are developed with singular uniformity in different species, and comparatively with the body in general, in a higher degree than in any instance we have yet mentioned. The brain is more decidedly distinguished from the spinal marrow by its greater breadth and more globular form.

The spinal marrow extends into the caudal vertebrae. It is, however, considerably reduced in size, at the same time that the column of caudal vertebrae is comparatively short. In fact, the inferior swelling on the spinal marrow, is contained within the sacral vertebrae, and its continuation is little more than a terminal fibril, extending into the tail, and giving off some few pairs of nerves through the holes between the caudal vertebrae. One of the principal points to be noticed in the brain of birds is, that the three primary divisions belonging to it are no longer placed one behind the other, as in the two preceding classes, but are situated one below the other. The anterior mass appears already

to occupy a higher rank than that of mere olfactory ganglia. It still, however, consists chiefly of gray substance, and, as in the preceding classes, is principally connected with its fellow by a narrow commissure; besides this, however, there is a small soft commissure placed above it, which Meckel, who first discovered it, considers as a rudiment of the great commissure of the brain in the following class, and which Carus looks on as more particularly corresponding to the anterior inflected portion of the corpus callosum, a part which is only found very strongly marked in the rodentia among mammalia. Within the ventricles are large swellings, corresponding to the corpora striata of man. The form of the hemispheres varies to some extent in the different species of birds. In passerine birds they are usually long and broad, completely covering the optic tubercles; in accipitres, on the contrary, the optic tubercles project considerably beside and behind them, although, at the same time, the hemispheres are of remarkable breadth; in some aquatic birds, the duck for instance, they are, on the contrary, rather oblong. The olfactory nerves always arise from their anterior part, with the intermedium of a swelling on each side, a medullary stria running along the lower surface of each hemisphere to the origin of the corresponding nerve.

In order completely to detect the coincidence of form between the second mass or division of the brain of birds and the corresponding part in amphibia, it is only necessary to consider the brain of a nearly perfect embryo of a bird as intermediate between them. Here (in the embryo) the hemispheres, as in the amphibia, are, comparatively, smaller and narrower, whilst the optic tubercles are found lying close together, and immediately behind them, which is not the case in the full grown bird. In the latter, where, as in amphibia, we may distinguish between the ganglia and the proper optic tubercles; these last are situated more laterally and inferiorly, being pressed aside by the greater expansion of the hemispheres, but in such a manner, that they are still connected by a medullary membrane, corresponding to the roof of the aqueduct in the human brain. They are smaller in proportion to the rest of the brain; in which respect, as well as in the abundance of medullary substance covering their internal and external surfaces, they approximate to the anterior pair of the corpora quadrigemina in man. Their cavities are small, and open into the space beneath the medullary commissure of the optic tubercles above mentioned.

As to the ganglia of the hemispheres, to which different writers have assigned very various characters, if we carefully consider the series of formations of the brain in the various stages of its progressive advance towards perfection, it will not admit of a doubt that they correspond absolutely to what have been called the optic thalami in the human brain.

The cerebellum, which is the principal portion of the *third cerebral mass*, here, as we found the case in certain cartilaginous fishes and amphibia, consists of lamina disposed in transverse folds, and covering the fourth ventricle; with this difference, however, that its structure is much more perfected. The cerebellum in birds is very similar to the vermiform or central portion of the same part in man. Here, as in some fishes and amphibia, are lateral appendages, which, however, must not be identified with the great lateral lobes of the human cerebellum, but rather with the parts which Riel has called "flocken." The ganglia of the auditory nerves are also very distinct below the cerebellum.

In the spinal and cerebral nerves we find but few striking peculiarities, the nerves being distributed to the different parts of the body, according to the same general plan as in man. It has already been mentioned that the olfactory nerves arise from the anterior extremities of the hemispheres. The optic nerves are generally very bulky, admitting of comparison in this respect only with those of some lizards. They arise from the whole of the external surface of the optic tubercles, and form a perfect decussation in the region of the infundibulum.

The sympathetic nerve is placed at each side of the whole vertebral column, and has a ganglion at each vertebra, peculiarly

liarily distinct within the thorax; each ganglion is connected to the next by a double cord, as in the ganglionic chain of inferior animals, and frequently gives off numerous twigs to the neighbouring vessels and viscera, as well as a constant one to the nearest spinal nerve. This chain of ganglia is most remarkable in the neck, where it is lodged in the canal formed by the transverse processes of the cervical vertebræ on each side. Superiorly, however, it terminates at the extremity of this canal in the third cervical vertebra in a slender fibril, which bends outwards, and is connected with the vagus nerve, and also, according to Cuvier, with the fifth and sixth pairs.

54. Brain of the Casoar, side view.—No. 23, the accessory nerve of Willis, and eighth pair; 4, the sixth pair; 5, the fifth pair; 6, fourth pair; 7, optic lobes; 8, third pair; 9, optic tubercles; 10, optic nerves; 11, pedicle of the hemispheres; 12, olfactory lobule; 13, lateral part of the cerebral hemispheres; 14, lateral part of the cerebellum.

53. Optic lobes and nerves of the ostrich.—No. 1, medulla spinalis; 3, interlacement of the fibres of the cerebral peduncles; 2, 6, optic lobes; 4, 5, interlacement of the optic nerves.

In the class *mammalia* the spinal marrow is no longer comparable to the brain in point of size, as in fishes and amphibia; nor in respect to the perfect development of individual portions of it, as in birds; and consequently we find the spinal marrow gradually becomes more completely subordinate to the brain. The latter not only advances considerably, as relates to the perfection of its internal form, but also acquires a notable increase of bulk, as compared with the body in general, although the preceding class already, to a certain extent, approaches in that respect to the present.

The spinal marrow, in general, is much more similar to that of man, as regards its form, position, and investments, than in the preceding classes, although there are sufficiently striking marks of distinction. One of the most essential is the canal of the spinal marrow, which probably exists in the whole class. The spinal marrow also extends lower down in the vertebral canal than in man; and although it always forms a cauda equina (the origins of the last nerves sent off being higher up than the inter-vertebral holes), it still reaches into the sacrum, and even gives off nerves there, which pass through the holes of the caudal vertebræ, the cord itself no longer extending so far, except, perhaps, in the aquatic mammalia. In this class, likewise, the triple swelling of the spinal marrow above the medulla oblongata, in the middle for the nerves of the anterior extremities, and below for those of the posterior extremities, is recognizable, the last of the three being, in general, proportionally thicker than in man. It is remarkable that, in certain short-necked animals, as rats and mice, the upper and middle enlargements of the chord are so completely united into one mass, that the portion of the spinal marrow contained in the cervical vertebræ is nearly as large again as the remaining part. The posterior groove of the spinal marrow in this class, and even in man, is less distinct than in those preceding: it still exists, however, and is sometimes of considerable depth; for instance, in the rodentia and bats. The progressive improvements in the structure of the brain in this class are very essential: they consist partly in the greater abundance of fibrous substance in the hemispheres, which are connected by an additional large commissure, and partly in the higher degree of development of the cerebellum. The optic tubercles, on the contrary, recede, and have appended to them a second pair of ganglia, from which circumstance the whole mass receives the name of corpora quadrigemina. Speaking generally, the form of the brain, as it presents itself in the rodentia, constitutes the most perfect intermedium between the formation of the same organ as it exists in this and the preceding class. Of the individual masses composing the brain, the first, as already noticed, is peculiarly distinguished by the appearance of the corpus callosum and fornix, which, together with the anterior commissure, already existing in fishes, unite the two hemispheres. The external form of the hemispheres in the ro-

dentia, as well as in the shrews, moles, and bats, is an oval, smallest anteriorly, and the upper surface is perfectly smooth, as in birds. Posteriorly, they do not cover the cerebellum, and frequently not the optic tubercles. Internally, the anterior fold or inflexion of the corpus callosum, and its prolongations into the lateral ventricles, (cornua ammonis) are particularly wide and large. The anterior pillars of the fornix are very short, being soon lost behind the inflexion of the corpus callosum. The formation of the hemispheres in mammalia generally coincides, in a remarkable manner, with that of the optic tubercles in many of the osseous fishes, whence, in the latter, those tubercles have frequently, but incorrectly, been viewed in the light of hemispheres. The hemispheres as they exist in the rodentia and chiroptera come next to those of birds: they do not present any fossæ, or convolutions, in the mouse, rat, marmot, beaver, bat, two-toed ant-eater, &c. In the carnivora, ruminantia, &c., they are much more voluminous, are furnished with distinct convolutions, and cover not only the whole of the corpora quadrigemina, but also a part of the anterior surface of the cerebellum, in the same manner as in the fœtus of the sixth and seventh month. In apes and porpusses the hemispheres are still larger, and here first present a third or posterior lobe, the imperfection of which is marked by the absence of convolutions upon it in most quadrumana, in the same manner as they appear there at the latest period only of the existence of the human fœtus. M. Spurzheim, it is true, asserts that the third or posterior lobe of the hemispheres exists much more uniformly; in which respect he differs from Cuvier, Tiedemann, and Serres. His opinion, too, appears to be contradicted by the fact, that the posterior horn of the lateral ventricle, and the hippocampus minor contained within it, first present themselves in the quadrumana. The corpora striata are present in mammalia, and in the rodentia and edentata are much larger in proportion to the hemispheres than in carnivora and ruminantia; thus forming an additional point of approximation to the organization of birds. Of the corpus callosum it is sufficient to remark, that its size and development have an immediate relation with the condition of the hemispheres. Such, also, is the case with the fornix, which is, in all instances, formed by a medullary layer, descending from the optic thalamus into the mammillary body on each side; from whence, re-ascending behind the anterior commissure to meet its fellow, it sends off a medullary lamina on each side to the under surface of the corpus callosum, called septum lucidum; and then again diverges from its fellow to form the cornu ammonis, and terminate on the outer surface of the hemisphere.

Of the different portions of the third mass, the cerebellum in mammalia, is principally distinguished from that of the preceding classes, in this respect, that it is divided into a central mass and two lateral lobes. The middle or vermiform mass, so small in man, is usually very large in mammalia, apes alone, and, according to Cuvier, the porpoise excepted.

The number of the laminæ or transverse folds of the cerebellum is generally much greater than in the foregoing classes; but also much less than in man: hence, also, these laminæ are proportionally thicker and more convoluted, so much so, that the vermiform process is sometimes almost S shaped. The bulk of the cerebellum is likewise greater in proportion to the rest of brain than in man. The remarkable increase of size and development of the cerebellum in this class, seems to be closely connected with the appearance of the pons varolii, which was deficient in the preceding classes, and which may probably be correctly designated as the inferior commissure of the cerebellum. It coincides with such a view, that this part, which in man attains a very considerable size, is here generally, and in the rodentia particularly, narrow. The pons is generally separated into a posterior and anterior portion. The anterior appears very distinctly in the mouse and bats, as the inferior commissure of the posterior pair of corpora quadrigemina; the posterior on the contrary, is often so little elevated, that the corpora pyramidalia, which are always very distinct in mammalia,

take their course over it. We have further to notice here, also, the very great breadth of the medulla oblongata, which gradually diminishes in the superior species, and particularly in the porpoise. In the fourth ventricle, which is formed in the same manner as in man, the medullary striæ connecting the ganglia of the auditory nerves in man are still deficient. The corpora olivaria likewise, are either wanting in most of the mammalia, or at least do not contain the same arborescent ramification of grey and white substance as in man: in the porpoise, however, these parts are very much developed.

It had been generally admitted that the olfactory nerves were wanting in the porpoise, and probably in the other cetacea, until Jacobson and Blainville asserted that they had discovered them. Rudolphi, however, contradicts the statement from his own observations, and those of Dr. Otto; who examined the brains of several specimens in the fresh state, and sent others to Rudolphi, still enveloped in the arachnoid, so that, had the nerves existed, they could not have escaped observation. The same remark applies to the whale, (*balæna mystecetus*) and narwhale, (*monodon monoceros*) examined by Rudolphi.

The optic nerves generally have, in mammalia, altogether the same course as in man, their size only varying materially. In mice, rats, bats, and hedgehogs, for instance, they are very slender; on the contrary, in the squirrel, rabbit, and hare, very large.

The remaining cerebral and spinal nerves in this class, are distributed in every essential respect as in man: we may, however, notice the very striking size of the fifth cerebral pair in most mammalia.

In mammalia, as in man, the cervical portion of the sympathetic nerve, no longer lies immediately upon the vertebral column, and the number of its ganglia in that region no longer corresponds to the number of vertebrae. So few other important peculiarities are to be found in the remaining divisions of the ganglionic system, that a distinct investigation of it appears superfluous.

With respect to the functions of the nervous system, we remark that nerves are longitudinally divided into thin fibrils, and that this arrangement enables such of them as are sentient to take cognizance of the particular forms, as well as the mere presence of bodies. Had they been homogeneous, they must have possessed two functions, a power of acknowledging the form of objects, and that of acknowledging simply their presence.

The size of a motive nerve appears to depend less on the bulk of the part it supplies than upon the variety of movements that can perform. The size of a sentient nerve less on the intensity of the impressions it conveys but on their number. Sentient nerves are, *cæteris paribus*, larger than motive. Since many plants and animals move that have no nerves, these elementary parts may be considered as only necessary to concentrate the movements of distant organs, or, in other words, to excite remote muscles, the intermediate parts remaining quiescent. Thus a medusa has no nerves, though, when a stimulant is applied to it, it contracts: for the medusa does not contract a particular line or range of its striæ, but all of them simultaneously. For example, suppose the line *a—b* were stimulated at the end marked *a*, a contraction would take place, were the line pure muscle, through its whole extent, strongest at *a*, and gradually getting weaker towards *b*, an effect which it is not altogether inconceivable to suppose may be effected by a power of attraction. But if the line in question were traversed by a nerve, the ends *a* and *b* would begin to contract, whilst the intermediate parts were quiescent; and the consequence would be, that the line would become curled, and would enclose any substance placed between its arms. Now this is what occurs in the animals where the first trace of the nervous system is found. In the *ASTERIAS* and *HOLOTHURIE* a nervous collar surrounds the entrance to the stomach, and sends a nerve to each ray. These animals lie outstretched in the water; if any matter be placed on their feelers, the nerves carry the impression to the nervous circle:

this excites the extremities of all the rays; they contract, and the matter in question is thrown into the stomach. This nervous circle has some ganglions in it; the functions of which are probably two in number, to increase the nervous power at the part where it must evidently be required in the greatest degree; and, secondly, to convert the sentient impulse it derives from one nerve into the motive influence it imparts to another. There is no evidence, nor is it probable that any consciousness exists here; the operation of the nerves is doubtless under the governance of an imperative law. The next step in the gradation of function is, that by means of a peculiar apparatus nerves become capable of receiving impressions from light, or perceiving vibrations in the media that surround them, or even of distinguishing the chemical qualities of those media. Hence seeing, hearing, &c., are superadded to the mere sense of touch. But there is no evidence that these may not, to a certain degree, exist without any very clear consciousness on the part of the animal possessing them. A form deciphered on the eye of a cuttle fish may excite a motion as determinate and automatic in the nerves and ganglia of that animal as the immediate contact of a knife could be capable of exciting in the separated muscle of a frog.

That pleasure and pain are felt very low in the creation is evident, both from experiment and from the consideration that animals of the fullest life require a sense of *appetite*, to stimulate them to supply themselves with food. Perhaps the next instincts we observe in animals, is that of approaching things which are pleasant, and receding from such as are disagreeable. To lay hold on that of which the presence is associated with the remembrance of a pleasant taste, is perhaps the next. Here we have association, and consequently reminiscence developed, as very early powers, though very confused ones, the movements of the animals being determined by a few objects. These associations are of course in the feeble origin, the result of original determinate laws, but become strengthened and fully formed in the consequence of repetition; and on these *habits* become developed, of which nothing more can be said, than that they are produced by the combined operation of internal powers and external circumstances. Upon the whole, we remark that in the animal kingdom, the prime symptoms of cerebral powers begin at a very low scale, at a point which is undetermined; that they acquire, insensibly but rapidly, a high degree of development, and furnish no marked point of difference, except at that single step which separates the mind of man from the rest of the creation. With respect to the parts of the nervous system, in which particular instincts reside, it appears fair to infer the ganglionic enlargement, which is formed at the union of any particular sets of nerves, to be the spot in which the instinct, or habit, or association is developed, that refers to the impressions those nerves are calculated to convey: that, for example the first cerebral lobe is the seat of the remembrance of smells in a fish; and the second, the seat of sights. What renders this investigation complex, is the circumstance that the different parts of the brain being connected intimately together, the affections of one part influence in a great degree the other—a reciprocating action which a mere glance of the nervous movements must convince us is absolutely requisite. In the higher animals, this union becomes so perfect that the central part of the nervous system forms, as it were, but four parts; the cerebrum and cerebellum united by the tuber annulare and the spinal marrow; and these even are intimately connected. Here it is probable that the cerebrum is at once the seat of the associations that are exercised on the impressions of sight, smelling, and touch.

With respect to the size of a central lobe of the nervous system, that does not appear to be in proportion to the size of the nerves that terminate in it, or the perfection of the sense in the parts those nerves supply; neither does it depend on the intensity or force of the instinct. But it appears to be intimately connected with the *number* of habits, or associations, that it is required to receive. Hence the size of the brain

is a tolerably good measure, generally speaking, of the edibility of an animal. At the same time, we must not push this conclusion too far, nor expect to find that a dolphin, because its brain is as large as a man's; can retain as many conceptions in its memory, or associate as readily those conceptions with external impressions; or, that a man with a large head has more of these faculties than one with a smaller one. The changes that are wrought on the brain are too subtle for our view; but no fact is more clear than that the cerebral functions never go on, unless there is a due supply of aerated blood. This supply varies in quality in different animals, and may vary in this respect in minute particulars among individuals; it varies in quantity, not only in different individuals, but at different periods; and the connexion between this variation, and the excess or diminution of the cerebral functions, has been observed by every one.

Though there is no subject more interesting in Zoology than the present, our limits, already exceeded, forbid us to enter further into its consideration. The same reason compels us to abbreviate very much of what we had to say on the senses.

The senses of taste and smell are probably enjoyed by nearly all animals, though they do not reside in the same parts. In such as have no tongues, the digestion of particular foods may be so pleasant as to render the stomach a true gustatory organ; and where the nasal cavities are absent, palpi, or even a respiratory cavity, may receive various modifications from the existence of different aromæ in the air.

With respect to the organ of sight, though the whole bodies of some zoophytes seem capable of perceiving light, it is only in a proper eye that the form of objects can be perceived: and this organ exists in the sepia and helix alone, and in the class vermes.

In insects, two kinds of eyes, very dissimilar in their structure, are found. One sort is small and simple (stemmata); the others, which are large, seem to consist of an aggregation of smaller eyes; for their general convexity is divided into an immense number of small hexagonal convex surfaces, which may be considered as so many distinct cornææ. The first kind is formed in different numbers in most of the aptera, as also in the larvæ of many winged insects. When these undergo the last or complete metamorphosis, and receive their wings, they gain at the same time the large compound eyes. Several genera of winged insects, and aptera (as the largest species of monoculi) have stemmata besides their compound eyes.

The internal structure has hitherto been investigated only in the large polyedrous eyes. The back of the cornea (which is the part, divided in front into the hexagonal surfaces, called in French, *facettes*) is covered with a dark pigment. Behind this are numerous white bodies, of a hexagonal prismatic shape, and equal in number to that of the facettes of the cornea. A second coloured membrane covers these, and appears to receive the expansion of the optic nerve.

Blumenbach thinks it probable, that the polyedrous eyes are adapted for distant objects, and the simple ones for such as are more near.

We have engraved two figures, in order to shew the eyes in insects.

Fig. 42 is a representation of the parts of the eye, as they are attached to the brain in the scarabæus: *a a*, the pyramidal fibres; the cornea which surmounted them being removed: *b*, the fibrous membrane which receives the optic nerve, *c*. This membrane is white on the exterior surface, but dark where it is in contact with the nerve. This dark appearance is represented at *d*.

Fig. 43 represents the eye of the drone opened from below: *x*, the medulla spinalis; *y*, the first ganglion that the medulla forms after emerging from the cranium; *s*, the cortical; *t*, the medullary substances of the brain; *z*, the facettes of the cornea, and the pyramidal bodies; *g*, the cortical substance of the eye which receives the optic nerve; *x*, the inner coats; *o*, the eye; *u*, the part where the pyramidal bodies are largest.

The peculiarities in the eye of fishes, which belong either

to the whole class, or to most of the genera and species, consist in the division of their choroid coat and retina into several manifestly distinct laminæ; and in the existence of two small organs within the eye, which belong exclusively to this class.

1. A body, generally resembling in shape a horse-shoe, lies between the internal and middle layers of the choroid; some have thought it muscular, and others glandular. 2. The tunica Ruyschiana gives origin to a vascular membrane, resembling in its form a bell (campanula of Haller). This goes towards the lens, and has, therefore, some resemblance to the marsupium of birds.

No true ciliary body is found, at least in the bony fishes.

The crystalline lens of most fishes is very large in comparison with the size of the eyeball, and nearly or entirely spherical. The vitreous humour on the contrary is small, and the aqueous in many cases is hardly discernible.

The eyes are very large in birds.

The distinction between certain parts of the eye, where the membranes have been supposed to be continuous, appears more plainly in some birds, than in any other animals. The boundaries of the choroid coat and iris are very clearly defined in the horned owl (*strix bubo*); and those of the margin of the retina, and the posterior border of the ciliary body, very distinct in the toucan (*rampastos tucanus*).

The ciliary processes of birds are not very prominent; they consist rather of striæ than of loose folds. They are always closely connected to the crystalline capsule. There is no tapetum in this class.

A great peculiarity in the eye of birds consists in the marsupium (*pecten plicatum*; in French, *la bourse, le peigne*), the use of which has not hitherto been very clearly ascertained. It arises in the back of the eye, proceeding apparently through a slit in the retina; it passes obliquely into the vitreous humour, and terminates in that part, reaching in some species to the capsule of the lens. The figure of its circumference is a truncated quadrangle. Numerous blood-vessels run in the folds of membrane which compose it; and the black pigment by which it is covered, suggests an idea that it is chiefly destined for the absorption of the rays of light, when they are too strong or dazzling.

The third eyelid, or *membrana nictitans*, is a thin, semi-transparent fold of the conjunctiva; which, in the state of rest, lies in the inner corner of the eye, with its loose edge nearly vertical, but can be drawn out so as to cover the whole front of the globe. By this, according to Cuvier, the eagle is enabled to look at the sun.

The eye of mammalia in general differs little from that of man, except in their form and size, or in the separation of individual parts.

The sclerotica of the cetacea is distinguished by the great thickness of its posterior part; when the eye-ball equals an orange in size, the back of this membrane is an inch thick; so that, although the globe be spherical, the space containing the vitreous humour is of a different form. The extent of the cornea seems to be greatest in the porcupine (*hystrix cristata*), where the cornea extends over half the globe.

The choroid coat consists more plainly in the cetacea than in any other mammalia, of two distinct laminæ, of which the internal (*membrana Ruyschiana*) is covered with a dull tapetum.

The tapetum occupies the temporal side of the bottom of the eye-ball; *i. e.* it is placed exteriorly to the entrance of the optic nerve. It exists in the carnivorous and ruminating animals; in the solipeda, pachydermata, and cetacea. In the dog, wolf, and badger, it is of a pure white, bordered by blue.

The iris varies in thickness in the different genera. In no instance can we discover true muscular fibres; the examination of the part in the elephant and whale having afforded in this respect the same result, as the tender and almost transparent iris of the white rabbit.

The size of the crystalline lens varies in proportion to that of the vitreous humour; and sometimes very considerably. Blumenbach found the largest lens in this point of view in the

the

the comparatively small eye of the opossum (*Didelphis marsupialis*); the whale has the smallest. No mammalia have it so slightly convex on the surface as man.

The following numbers give the proportions of the three humours, measured on the axis of the eye, after it had been frozen.

	Aqueous Humour.	Crystalline.	Vitreous Humour.
Man.....	$\frac{5}{22}$	$\frac{4}{22}$	$\frac{13}{22}$
Dog.....	$\frac{5}{21}$	$\frac{5}{21}$	$\frac{11}{21}$
Cow.....	$\frac{5}{27}$	$\frac{14}{27}$	$\frac{13}{27}$
Sheep.....	$\frac{5}{17}$	$\frac{11}{17}$	$\frac{12}{17}$
Horse.....	$\frac{9}{23}$	$\frac{15}{23}$	$\frac{13}{23}$
Owl.....	$\frac{5}{27}$	$\frac{11}{27}$	$\frac{11}{27}$
Herring.....	$\frac{7}{7}$	$\frac{7}{7}$	$\frac{7}{7}$

A lacrymal gland exists in all animals of this class.

The nictitating membrane, (*membrana nictitans, palpebra tertia, seu interna, periophthalmium*) of which only a rudiment exists in the quadrumana and the human subject, is very large and moveable in some quadrupeds. This is the case in animals of the genus *felis*, in the opossum, the seal, and particularly in the elephant.

Of the organ of hearing.—In the class *vermes* the *sepia* only have any thing like an organ of hearing. In the cartilaginous ring, to which the large tentacula of the animal are affixed, two oval cavities appear, in each of which is a small bag, containing a bony substance, and receiving the termination of nerves.

There is no doubt that several insects possess the sense of hearing; but the organ of this sense is very uncertain. In some of the larger animals of the genus *cancer*, a part can be distinguished, which seems to be analogous to the vestibulum of the former classes. A small bony tube is found on each side at the root of the palpi: its external opening is closed by a firm membrane; and it contains a membranous lining, on which a nerve, arising from a common branch with that of the antennæ, is expanded.

Fishes possess near the anterior cervical vertebræ considerable ossicula, which may be compared to the malleus, incus, and stapes; and in those, which are provided with a swimming bladder, these bones are so connected with that organ as to render it probable that it is auxiliary to the sense of hearing.

Their internal ear consists of three large canals, which are generally seen to project into the cavity of the cranium. Opposite to the termination of the auditory nerves on the vestibulum, one, two, or three neatly formed stones are found. These are as white as porcelain, particularly in several of the bony fishes, and very dry and brittle in their texture.

The internal ear of fishes is distinguished from that of the other three classes of red-blooded animals, by this remarkable peculiarity, that it grows as the fish increases in size, and consequently that its magnitude is in the direct ratio of the bulk and age of the animal.

Turtles, frogs, and most species of the lizard kind, possess, besides semicircular canals, a tympanum and Eustachian tube, like warm-blooded animals. Both the latter parts, however, as well as the ossicula auditus, are wanting in the salamander. The foramen ovale in this animal is merely closed by a portion of cartilage, and the vestibulum contains a soft stone.

The serpents, with a very few exceptions, as the blind-worm, (*anguis fragilis*) have neither tympanum nor Eustachian tube. They have a kind of rudiment of ossiculum.

The want of a cartilaginous external ear is compensated in birds, particularly in those of the rapacious kind, by the regular arrangement of the feathers round the opening of the meatus. Several also, chiefly of the last mentioned class, and particularly among the owls, have a peculiar valve placed at the opening, partly of a membranous, partly of a muscular structure.

They have a single ossiculum auditus, connecting the *membrana tympani* with the *fenestra ovalis*, and consequently supplying the place of the malleus and stapes of the mammalia.

The Eustachian tubes have a kind of common opening on the arch of the palate.

The labyrinth is distinguished by large canals, projecting from the cranium, and not hollowed out of a hard bony substance, as in most mammalia, and by the want of cochlea.

The four-footed mammalia are the only animals which possess true external ears; and, even in that class, several instances occur in which these parts are wanting.

The external auditory passage is furnished with a valve in such animals as go frequently into the water, by which they can close it when they dive: the water-shrew (*Sorex fodiens*) affords an example of this structure.

All mammalia have a *membrana tympani*, a tympanum situated within this, and an Eustachian tube passing from that cavity to the fauces; except in the cetacea, where it opens in the blowing hole. The membrane is rather concave on its outer surface, being slightly depressed in the middle. All the animals of this class are furnished with the two *fenestræ*; the *fenestra ovalis*, which is filled by the base of the stapes; the *fenestra rotunda*, at which the *scala tympani* of the cochlea commences.

In the horse and ass the Eustachian tube does not open immediately into the larynx; but into a sac peculiar to this class of animals, which is situated on the lateral parts of the lower jaw.

In most of the four-footed mammalia, there is connected with the tympanum another cavity; which, according to the situation of the bony organ that contains it, must be compared to the mastoid cells in the temporal bone of man.

In several animals this organ forms a mere bony cavity, (*bullæ osseæ*) viz., in the dog, cat, martin, squirrel, hare, and some of the bisulca.

Warm-blooded quadrupeds have, like the human subject, three ossicula auditus; which on the whole resemble in form those of man. But the ducked-billed animal, whose structure in every respect is so anomalous, has only two.

Cuvier has found that the stapes is nearly solid in the cetacea; and that there is no perforation in the walrus. This peculiarity of structure seems to belong to such mammalia as live in water; for the seal has it in a smaller degree.—*Léçon d'Anat. comp.*, tom. ii. p. 505.

The labyrinth of the ear seems to agree on the whole, in its essential points, with that of the human subject. But the cochlea has in some cases a turn more than in man.

The ossicula auditus and the labyrinth are remarkably small in the cetacea.

ZOOM, a small river of the Netherlands, in North Brabant, which falls into the East Scheldt, at Bergen-op-Zoom.

ZOOPHORIC COLUMN, *s.* A statuary column, or a column which bears or supports the figure of an animal. *Johnson.*

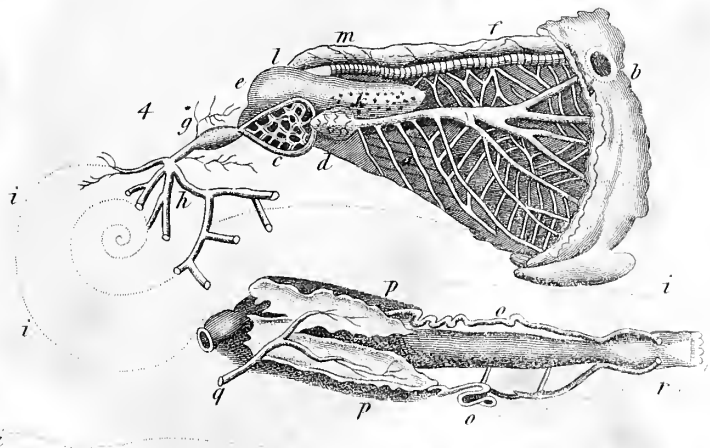

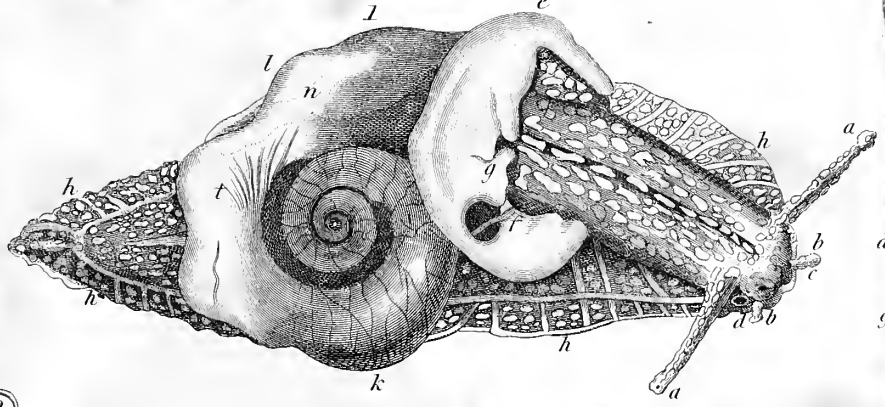

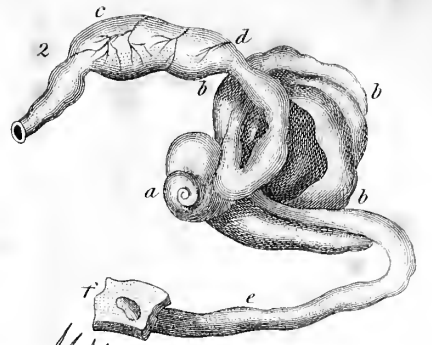

ZOOPHORUS, *s.* [*ζωοφορος*, Gr.] A part between the architraves and cornice, so called on account of the ornaments carved on it, among which were the figures of animals. *Johnson.*

ZOOPHYTE, *s.* [*ζωοφυτον*, of *ζωος*, and *φυτον*, Gr.; *zoophyte*, Fr.] Certain vegetables or substances which partake of the nature both of vegetables and animals.—They appear in grammar, like *Zoophytes* in nature, a kind of middle beings, of amphibious character. *Harris.*

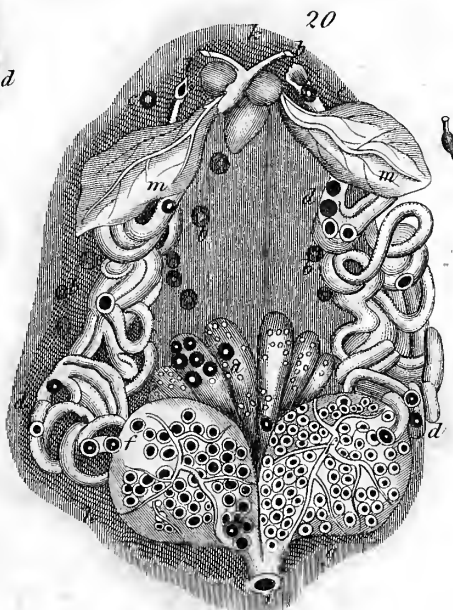

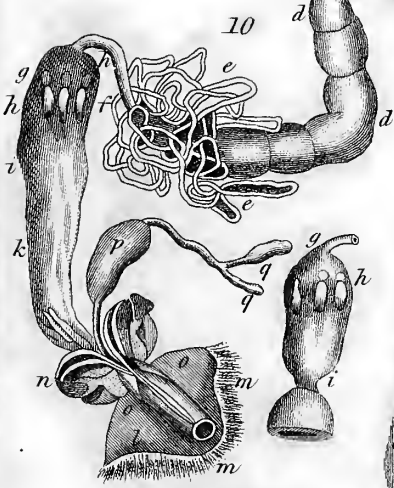

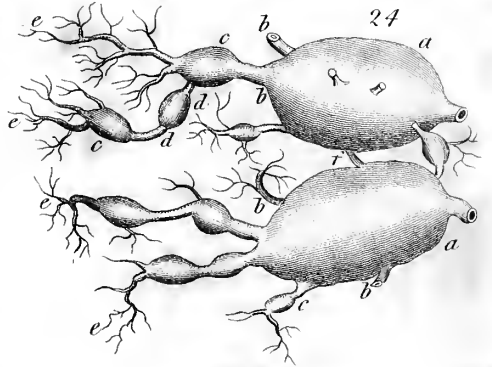

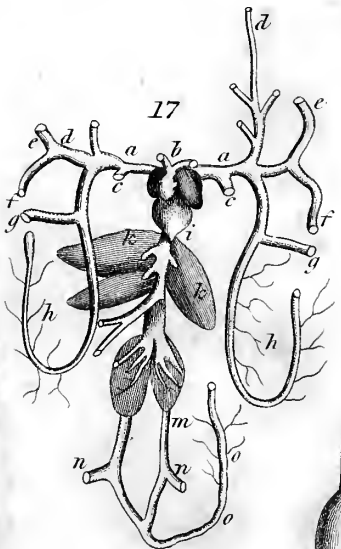

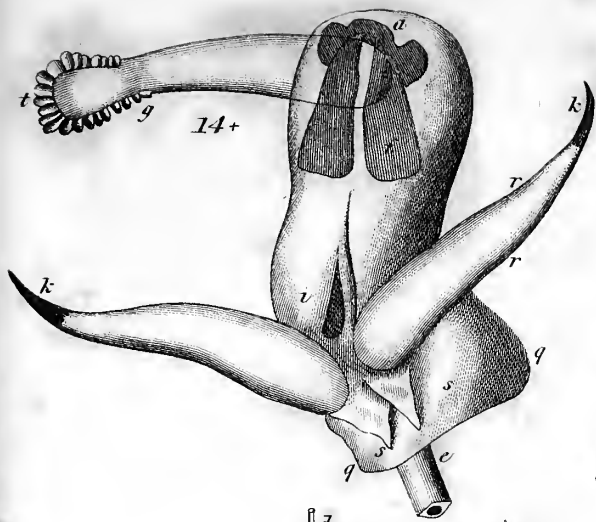

In the Linnæan system, the zoophytes, which constitute the fifth order of worms, (see *VERMES*.) are composite animals, resembling a flower, and springing from a vegetating stem. This order contains 14 genera, as the *TUBIPORA*, *MADREPORA*, *MILLEPORA*, *ISIS*, *ANTIPATHES*, *GORGONIA*, *ALCYONIUM*, *SPONGIA*, *FLUSTRA*, *TUBULARIA*, *CORALLINA*, *SERTULARIA*, *PENNATULA*, and *HYDRA*: see each respectively. The species enumerated and described in Gmelin's Linnæan system are 489.

ZOOTOMIST, *s.* A dissector of the bodies of brute beasts. *Johnson.*—It should rather be defined a dissector of animals, since his occupation is not confined to the dissection of beasts, but birds, fishes, insects, &c.

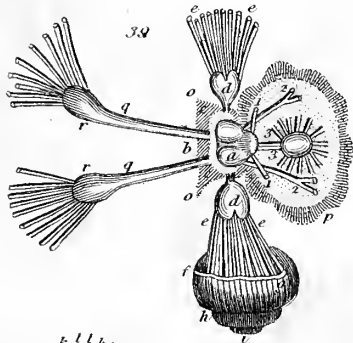

ZOOTOMY, *s.* [*ζωτομία*, of *ζωον* and *τεμνω*, Gr.] Dissection of the bodies of beasts.

ZOPFINGEN, an ancient town of Switzerland, near the river Aar. Its inhabitants, 1400 in number, are Catholics, and partly employed in the manufacture of linen, cotton, and silk. Here is a small public library, with a cabinet of medals and other antiques; 24 miles north-north-west of Lucerne.

ZOPIA, a river of New Granada, in the province of Antioquia, which joins the Cauca.

ZORBIG, a town of Prussian Saxony, in the government of Merseberg, with 1700 inhabitants; 12 miles north-east of Halle.

ZORGE, a village of Germany, in the duchy of Brunswick; 6 miles north of Walkenried. Population 1000.

ZORGE, a small river of Thuringia, which joins the Helm; 5 miles west of Nordhausen.

ZORN, a small river of France, in Alsace, which rises in the Vosges mountains, and falls into the Rhine.

ZORNENDORF, or ZARENDORF, a village of Prussia, in the province of Brandenburg; 6 miles north-by-east of Custrin, where the Russians were defeated in a sanguinary battle, by the king of Prussia, in 1758.

ZOROASTRI. See MAGI.

ZORRICA, a town in the island of Malta, which contains 3500 inhabitants.

ZOSIMA [thus called by professor Hoffmann, in compliment to three brothers, Anastatius, Nicholas, and Zoa Zosima, distinguished for their editions of numerous works of the Greek classics], in Botany, a genus of the class pentandria, order digynia, natural order of umbelliferae.—Generic Character. General and partial umbel of many unequal rays. General and partial involucre of many linear-lanceolate, acute, unequal, villous, permanent leaves. Perianth of five unequal, very short, permanent teeth. Corolla: universal, nearly regular, and uniform; flowers partly perfect and fertile; the central and lateral ones, in each umbel, male; partial of five, nearly equal, spreading, inversely heart-shaped, deflexed petals; rather concave on each side at the keel; tapering at the base; obliquely inflexed at the point, which is linear-lanceolate, acute, involute channelled. Stamina: filaments five, spreading or deflexed, straight, longer than the involute corolla, dilated at the base; anthers versatile, roundish, two-lobed. Pistil: in the perfect florets, germen inferior, ovate, compressed, villous; styles two, thread-shaped, channelled; their tumid base wavy and crenate at the margin; at length reflexed and permanent; stigmas simple, obtuse. Pericarp: fruit roundish-obovate, compressed, finely downy, bordered; the border externally tumid, and somewhat corrugated, internally striated; emarginate at the summit, crowned with the styles on their short, nearly sessile, crisped base; thickened at the bottom; the disk elevated and striated. Seeds two, of a similar shape, convex in the middle, with three elevated, narrow, central ribs, and two marginal ones; their interstices in the upper half occupied by four coloured stripes.—*Essential Character*. General and partial involucre of many permanent leaves. Corolla uniform. Some flowers male. Calyx tumid, five-toothed. Petals nearly equal, obovate, inflexed. Fruit roundish-obovate, compressed, villous, with a corrugated border; the disk ribbed.

Zosima Orientalis, or Oriental zosima.—The root is biennial, tap-shaped, milky. The whole herb when bruised smells like apium graveolens. Stem erect, near two feet high, cylindrical, furrowed, somewhat branched, and slightly leafy, about as thick as a swan's quill, rough to the touch with short whitish hairs. Leaves opposite, stalked, thrice pinnate, hoary with short pubescence; leaflets small, wedge-shaped, lobed; entire at the edges. Umbels two or three inches in diameter, on long stalks, terminal: partial ones of from twelve to fifteen flowers, milk-white, or yellowish-green. Germ downy.—Native of Persia, Georgia, and other countries about Caucasus, flowering in the early part of summer.

ZOSIMUS, a Greek historian, who held various civil offices under the younger Theodosius, about the commencement of the fifth century, and left a history of Roman affairs, in six books, the first of which furnishes a slight view of the emperors, from Augustus to Diocletian, and the others detail

the public events that occurred to the second siege of Rome by Alaric, and the pontificate and deposition of Attalus. Something seems to be wanting towards the end. The style of this historian is concise, perspicuous, and pure; but his prejudices against the Christian emperors have misled him; and particularly in his account of Constantine the Great. Leunclavius has attempted to justify him; and it has been allowed that he has divulged some truths which other historians have suppressed. Gibbon says, "credulous and partial as he is, we must take our leave of this historian with regret." The first edition of his work was that of R. Stephens, in 1581; others have been published by T. Smith, Gr. and Lat. Oxon. 1679, 8vo.; and the Variorum, by Cellarius, 8vo. 1679, 1712.

ZOSIMUS (Pope), a native of Greece, was elevated to the pontifical throne in March, 417, as successor to Innocent I., at the time when the Pelagian controversy prevailed. Cælestius, the chief disciple of Pelagius, presented his confession of faith to this pope, who approved it, and admitted him to his communion. That of Pelagius was likewise approved. The African bishops, however, who were hostile to the Pelagian doctrine, interested the emperor Honorius in their favour, and obtained from the pope an anathema of the doctrine of Pelagius and Cælestius, with a sentence of excommunication if they refused to abjure their tenets. A council was assembled, in which other bishops, who concurred in the Pelagian creed, were degraded from their episcopal dignity. The fluctuations and inconsistencies of Zosimus's conduct depreciated the character of the pope, and furnished reason for questioning his infallibility. Other instances occurred, in which he was hardly able to maintain his authority. This pope died in December, 418, leaving the character of an able man of business, but hasty, tenacious, and imperious. His thirteen epistles, that are extant, are written with spirit and elegance. He was canonized, as Bower says, by a mistake of cardinal Baronius, who supposed him to be a St. Zosimus in the martyrology of Bede.—*Dupin. Bower*.

ZOSSEN, a town of Prussia, in the province of Brandenburg, on the river Nor, with 1500 inhabitants.

ZOSSEN, a village of Austrian Silesia, near Jagerndorf.

ZOUFETE, a beautiful river of Lower Egypt, on the Damietta branch of the Nile.

ZOULE, a considerable village of Upper Egypt, 2 leagues from Rika.

ZOULNOUN, a village of Asiatic Turkey, in the government of Sivas; 10 miles south-south-west of Amasieh.

ZOUR EL HAMMAN, or ISLAND OF PIGEONS, a small island in the Mediterranean, near the coast of Algiers. Lat. 36. 26. N. long. 12. 38. E.

ZOU-WAN, a flourishing little town of Tunis, in Africa. Great quantities of linen and of caps are brought here from Tunis, and other places, to be bleached, and dyed scarlet. Behind this place is a high mountain, of the same name, yielding abundance of the finest water, which was formerly conveyed to Carthage by an aqueduct, extending 60 miles in length. At its foundation was anciently erected a temple, the ruins of which, with some inscriptions, may still be traced; 36 miles south-west of Tunis.

ZOWAMORE, or ZIMBZA, an island of the Mediterranean, near the north coast of Tunis, called by the ancients *Aegimurus*.

ZOYALTEPEC, a settlement of Mexico, in the intendancy of Oaxaca, containing 600 Indian families.

ZOZOLCO, a settlement of Mexico, in the intendancy of Valladolid, containing 320 Indian families.

ZOZORANGA, a settlement of Quito, in the province of Loxa.

ZRIN, a small town of Austrian Croatia, situated on a rock near the frontiers of Turkey; 43 miles east-south-east of Carlstadt.

ZSCHOCKEN, a large village of Saxony; 8 miles north-west of Grunhayn.

ZSCHORLAU, a village of Germany, in Saxony; 10 miles south-south-east of Zwickau.

ZUA, a small river of the Caraccas, in the province of Cumana, which rises east of San Fernando, and enters the Chivata.

ZUAQUEO, a small river of Mexico, in the province of Ostimuri, which enters the Hiaqui.

ZUANE, CAPE, ST., a promontory on the north coast of the island of Candia. Lat. 35. 15. N. long. 25. 41. E.

ZUBERECZ, a village of Hungary; 41 miles north-north-east of Neusohl. Population 1000.

ZUBIENA, a town of Italy, in the Piedmontese province of Biella, between the Alps and the Po, on the small river Acol. Population nearly 5000.

ZUCCARELLO, a fortified castle of Italy, in the Sardinian states, duchy of Genoa.

ZUCCARO, or **ZUCCHERO** (Tadeo), was a painter of considerable renown, born at S. Agnolo in Vado, in the duchy of Urbino, in 1529. His father, Ottaviano Zuccaro, was also a painter, but of moderate talents; and Tadeo was principally indebted to Pompeo de Fano for initiation in the art. Having, as he imagined, exhausted the store of information to be derived from his preceptor, animated by love of his art and a desire to free his father from further charge on his account, he, at the age of fourteen, went to Rome, unknowing and unknown. His relation Francesco d'Agnolo was then engaged painting, with Pierino del Vaga, the grotesques of the Vatican, and he had some hope of assistance from him; but his application was vain, and he was obliged to earn his daily bread by grinding colours in different shops, wherever he could find employment. He divided his time between this labour and copying from the works of Raphael, in the Palazzo Ghigi particularly, and was often compelled to sleep under the loggie of the palace, being unable to procure better accommodation. Weary at length of so much misery, he returned to his father, but soon left him to revisit the great emporium of art. Fortune now began to smile upon him; he became known to an artist named Giacomone, and having improved much with him, and acquired some credit, his relation Francesco d'Agnolo noticed him, and for a time they worked together. Afterwards he was engaged by Daniello da Parma, a scholar of Corregio and Parmegiano, to assist him in painting a chapel of Santa Maria, in a church at Vitto, in Abruzzo. The work was in fresco, and Zuccaro, according to Vasari, painted a large portion of the subjects required. When this was done, he returned to Rome, and was employed by G. Mattie to paint a facade of the Palazzo Mattei in fresco, where he executed, in chiaro oscuro, nine historical pieces relative to the history of Furio Camillo. He was then only 18, and the execution of them was a matter of surprise to all who saw them. By this his first public work he gained so much reputation, that he soon acquired considerable employment. The duke d'Urbino, hearing of his fame, sent for him to Urbino, and gave him a commission to paint in fresco the chapel of the Duomo there, which was delayed by various causes, and he returned to Rome in the time of Julius III., who employed him, under Vasari, in the Vatican, to paint in a frieze the labours of Hercules, which were afterwards destroyed by pope Paul IV., to make room for other works. Hitherto he had been principally employed upon ornamental subjects, but now a serious one was entrusted to his pencil; and he painted in fresco, for the church of Santa Maria della Consolazione, several subjects of the passion of the Saviour, which are regarded as among his best productions. He was afterwards called upon to exert his skill, by the cardinal Farnese, in the Palazzo Caprarola. This is his greatest work, and is that whereon his reputation most depends. He was liberally paid by the cardinal. The whole ornamental part of the building was entrusted to his care, and he laboured with great earnestness to make it honourable to himself and pleasing to his employer. It has been engraved by Prenner in a set of forty-five plates. Tadeo Zuccaro died at Rome in 1566.

ZUCCARO (Federigo), was a younger brother of Tadeo just mentioned, and born in 1543. He received his instruction from his brother, with whom he was placed at Rome, when very young, and who paid him the most affectionate

attention. He soon rendered himself useful to Tadeo in his great works, and engaged also in some labours for himself. Pope Pius IV. employed him, in conjunction with F. Barroccio, in the Palazzo Belvidere, where he gained great reputation. The brothers continued to work together without rivalry, and co-operated at the Vatican and the Villa Farnese. He was invited to Florence by the grand duke to finish the cupola, left imperfect by Vasari, and succeeded in pleasing his employer.

Gregory XIII. engaged him to paint the vault of the Capella Paolina: but having some dispute with the officers of his holiness, he avenged himself by a satirical picture which he exhibited. By this the pope was offended, and Zuccaro was obliged to fly, and leave his great work unfinished. He took refuge in France, where he was some time employed by the cardinal of Lorraine: and from thence he went to Flanders, where he painted cartoons for tapestries.

In 1574 he visited England, and was received very favourably. Here he painted portraits. The queen sat to him, and many of the nobility. How long he remained here is not exactly known. When he returned to Italy, he went to reside at Venice, where the patriarch Grimani employed him in his chapel to finish the fresco ornaments, begun by Battista Franco, and he added some designs of his own to them. He also painted there a large picture of the Adoration of the Magi. In conjunction with the great masters then living in Venice, he was employed in the hall of the grand council of that city, and he obtained as his reward the honour of knighthood. He soon after returned to Rome, and the pope not only overlooked his indiscretion, but allowed him to complete the work he had begun in the Capella Paolina.

On the accession of Sixtus V. he was invited to Madrid by Philip II. to adorn the walls and ceilings of the Escorial; but though he painted with his usual skill, and covered immense quantities of space, he had not his usual success in affording pleasure to his patron. Philip was not gratified with his works, and Zuccaro was dismissed; not, however, without being munificently rewarded for his labours. The works he left behind him were afterwards covered over by others from the hand of Pellegrini Tibaldi. On his return to Rome he established the academy of St. Luke, for which he received letters patent from Gregory XIII., and to which, at his death, which happened in 1609, he bequeathed all his property.

ZUCCHERELLI (Francesco), a very pleasing landscape painter, was born at Pitigliano in Tuscany, in 1702. He for some time attempted history, but abandoned it, and adhered solely to landscapes, which he adorned with very agreeably composed groups of figures. In 1752 he visited England, where he was much encouraged; but our greatest debt to him is due for his having persuaded Wilson to adopt landscape for his object, instead of portrait. At the foundation of the Royal Academy he was chosen an original member. After remaining here twenty years, he returned to Italy, and settled at Florence, where he had the misfortune to be reduced to indigence, by the suppression of a monastery where he had lodged the money he had acquired. He again resumed the pencil to support himself, and died at Florence in 1788, aged 86.

ZUDISHTIRA, in Hindoo Mythology, is one of the heroic sons of Pandu, whose wars and adventures occupy a considerable portion of the Mahabarat, an epic poem of great celebrity in the Shanscrit language.

ZUCKMANTEL, a town of Austrian Silesia; 17 miles north-west of Jagerndorf. Population 3000.

ZUDNOV, a town of European Russia, in the government of Podolia, with 3400 inhabitants.

ZUEROS, a town of Spain, in Cordova; 27 miles south-east of Cordova. Population 2000.

ZUFFERABAD, a town of Hindostan, province of Allahabad, and district of Joanpore. It is a flourishing place, and contains 20,000 inhabitants. Lat. 25. 49. N. long. 82. 40. E.

ZUFFURABAD, the Mahometan name of the fortress in Beider, in Hindostan.—As this name signifies the town of Victory,

Victory, there are a number of them, both in Persia and Hindostan.

ZUG, the smallest of the Swiss cantons, is situated in the interior of the country, and surrounded by the cantons of Zurich, Schweiz, Lucerne, and Aargau. Its area is only 120 square miles; its population 15,000. Except a small plain to the north of the town of Zug, this canton is covered with mountains and hills, of which the highest, however, is not more than 5000 feet above the level of the sea, and the others much lower. Here are consequently no glaciers or snow in the autumn months. Its manufactures are trifling; but its corn, its vines, and other fruits, are by no means inconsiderable. Its lakes are those of Zug and Egeri.

ZUG, the capital of the preceding canton, stands on the lake of Zug; 29 miles south of Zurich. The general assemblies of the canton are held here every spring. Population 1600.

ZUG, a lake of Switzerland, in the south of the canton of the same name, and partly in the canton of Schweiz. It is about 10 miles long, and from two to three wide. It presents a number of beautiful prospects.

ZUGLIO, or GULLIO, a small town of Austrian Italy, in the government of Venice.

ZUIDBROCK, a village of the Netherlands, 13 miles east of Groningen. Population 1100.

ZUIDLAND, a petty town of South Holland, 9 miles south-west of Rotterdam.

ZUIDWOLDE, a town of the Netherlands, in the province of Drenthe, with 900 inhabitants; 20 miles north-east of Zwolle.

ZUULA, a town of Fezzan, in Africa, on the caravan route to Mourzouk. It appears to have been formerly a place of great importance, and the residence of the sultans. Even now, the people of Bornou call the journey to Fezzan the journey to Zuula. This ancient greatness is attested by a mosque and other magnificent Moorish remains, as well as by extensive cisterns and vaulted caves. The place, however, is in a state of great decay, and does not contain more than a third of its ancient circuit; 60 miles east-north-east of Mourzouk.

ZUINGLE, or ZWINGLE (Ulric), the Swiss Reformer, was born January 1, 1484, at the village of Wildhausen, in the county of Tockenburg; and having discovered in his youth a studious disposition, was intended by his father for the church. Accordingly he was sent for education first to Basil, and then to Berne, where attempts were made to fix him in the convent of the Dominicans; but in order to prevent their taking effect, his father removed him to the university of Vienna, which was then in high reputation. Returning from thence to Basil, he was chosen classical tutor in his 18th year, where he made very considerable advances in knowledge, and particularly in that of the profession to which he was destined, whilst he taught others; availing himself of the lectures of Thomas Wyttembach, who, without renouncing the system of the schools, allowed his pupils to think freely for themselves. After a residence of about four years at Basil, Zuingle took the degree of M. A., and being chosen pastor of Glarus, was ordained by the bishop of Constance.

Notwithstanding the singular prudence and moderation which influenced his whole conduct, his reputation excited envy, and a conspiracy was formed against his life. Under the protection of the magistracy of Zurich he was safe; but his enemies insidiously proposed a conference at Baden, in Argovia. His friends, however, were not unapprised of his danger, and well knowing that the cantons were actuated by inveterate hostility against his person as well as his doctrines, they would not consent to his leaving Zurich. At the conference, which he prudently declined to attend, enmity was avowed both against him and his adherents. Some of the cantons, however, withheld their concurrence; and this was particularly the case with respect to the canton of Berne. In this canton, the reformation had made considerable progress, so that in 1527 several of its municipalities addressed the senate for the abolition of the mass, and the introduction of the form of worship established at Zurich. The reformers at

Berne summoned a convocation, to which the clergy of the other Helvetic states, and the neighbouring bishops were invited. Zuingle's attendance was also requested; and he thought it his duty to appear in that assembly, professedly convened for the advancement of the reformation. Haller was the leader of the party in this canton, and in connection with Zuingle and other coadjutors the cause to which they were devoted obtained a complete triumph; so that the grand council of that canton fully adopted the measures of that of Zurich. Upon this, five of the cantons which were attached to the old religion entered into a solemn engagement not to suffer the doctrines of Zuingle and Luther to be preached among them. At length the hostilities that subsisted between the catholic and reformed cantons were amicably terminated by the treaty of Cappel in 1529. The animosity, however, between these cantons was not extinguished. It broke out again with greater violence than ever; and the senate of Zurich has been charged with the first aggression, by arbitrary acts in favour of the reformed preachers in the common baillages. Its project of secularizing the abbey of St. Gall, which belonged to the Helvetic confederacy, was a greater grievance; and on the other hand, the five associated catholic cantons refused to concur with the others in expelling the Spaniards from the Valteline, and persecuted the reformed in their jurisdictions with the greatest severity. The sufferers sought the protection of Zurich, and the eloquence of Zuingle was employed in recommending their case to the senate. The breach widened, and a majority of the protestants agreed in stopping the transit of provisions to the five cantons, which depended upon foreign supplies. Zuingle in vain remonstrated against this cruel act; and the five cantons took up arms, and having published a manifesto, marched into the field in October, 1531. A detachment was ordered to prevent the junction of the forces of Berne with those of Zurich, and the main body advanced towards Cappel. This intelligence alarmed the people of Zurich; and they could only spare 700 men for the relief of their countrymen at Cappel. Zuingle was appointed to accompany them. A battle ensued; and though the Zurichers, animated by his exhortations, defended themselves valiantly, they at length were compelled to yield to superiority of numbers, and were entirely routed. Some died at their posts; others fled; and Zuingle received a mortal wound at the commencement of the action, and fell senseless to the ground. As soon as he had recovered sufficiently to raise himself up, he crossed his arms on his breast, and lifted his languid eyes to heaven. In this condition he was found by some catholic soldiers, who, without knowing him, offered to bring a confessor; but as he made a sign of refusal, the soldiers exhorted him to recommend his soul to the holy virgin. On a second refusal, one of them furiously exclaimed, "Die then, obstinate heretic!" and pierced him through with a sword. His body was found on the next day, and the celebrity of his name drew together a great crowd of spectators. One of these, who had been his colleague at Zurich, after intently gazing on his face, thus expressed his feelings: "Whatever may have been thy faith, I am sure thou wert always sincere, and that thou lovedst thy country. May God take thy soul to his mercy!" Among the savage herd some voices exclaimed, "Let us burn his accursed remains!" The proposal was applauded; a military tribunal ordered the execution, and the ashes of Zuingle were scattered to the wind. Thus, at the age of 47, he terminated a glorious career by an event deeply lamented by all the friends of the reformation, and occasioning triumph to the partisans of the Romish church. "In his character," says one of his biographers, "there appears to have been united all that makes a man amiable in private society, with the firmness, ardour, and intrepidity that are indispensable in executing the great task of reformation. By nature mild, his earnestness was the result of his sense of the importance of the cause he engaged in to the best interests of mankind, not of a dogmatic or dictatorial spirit. His views were large and generous, and his opinions rose above the narrow scale of sect or party. It was no small proof of liberality in that age that he ventured to assert his belief of the final happiness of virtuous heathens, and of all good

good men who act up to the laws engraven on their consciences. His temper was cheerful and social, somewhat hasty, but incapable of harbouring resentment, or indulging envy and jealousy. As a reformer he was original; for he had proceeded far in emancipating himself from the superstitions of Rome by the strength of his own judgment, and had begun to communicate the light to others, whilst Luther still retained almost the whole of the Romish system, and long before Calvin was known in the world. He was more learned and more moderate than the first of these divines, and more humane and kind-hearted than the last. He wrote many works of utility in their day; and the reform, of which he was the author, still subsists unchanged among a people distinguished by their morals and mental cultivation."—*Life of Zuingli, by J. G. Hess. Mosheim's Eccl. Hist. Core's Travels in Switzerland.*

ZUINGLIANS, a branch of ancient Reformers or Protestants; denominated from their author Ulric, or Huldric Zuinglius. See **ZUINGLE**.

ZULE, a river of New Granada, province of Pamplona, which enters the lake Maracaibo.

ZULLA, a town of Abyssinia, situated at the bottom of Annesley bay. Considerable ruins are situated in its vicinity, which, according to every appearance, are those of Aduli, anciently the great emporium of Abyssinia; 30 miles south-east of Massuah.

ZULLICHAU, an inland town of Prussia, in Brandenburg. It is surrounded by a mound and moat, and has a citadel, with its separate wall and ditch. The population of the town and suburbs is about 5500, employed partly in manufactures of woollen, linen, and leather. In the town, the only public institutions are the schools, and an orphan-house on a larger scale; 43 miles east-south-east of Frankfurt on the Oder.

ZULPICH, a town of the Prussian states, province of Cleves and Berg, on the Nassel; 20 miles south-west of Cologne. Population 1000.

ZULTEPEC, a town of Mexico, in the intendancy of Mexico, situated on a craggy mountain, and deriving its support from mining; 54 miles south-west of Mexico. Lat. 18. 58. N. long. 99. 52. W.—It is the name of two other small settlements in Mexico.

ZULZ, or **BIALA**, a town of Austrian Silesia; 20 miles south-south-west of Oppeln. Population 2300.

ZUMALAO, a small settlement of South America, in Tucuman.

ZUMAMPA, a settlement of South America, in Tucuman, on the river Dulce.

ZUMAYA, or **CUMAYA**, a small town of Spain, in the province of Guipuscoa; 14 miles west of St. Sebastian.

ZUMBO, a mart in the interior of Eastern Africa, the farthest to which the Portuguese have yet penetrated; nearly a month's journey beyond Tete, their farthest settlement along the Zambeze.

ZUMPANGO, a settlement of Mexico, containing 554 Indian families, 12 of Spaniards, and 92 of mulattoes; 23 miles north of Mexico. Lat. 19. 47. N. long. 99. 2. W.

ZUMPANGO, one of the five lakes in the valley of Mexico, about 10 miles from that city. It is $1\frac{3}{10}$ square leagues in extent. It is to carry off the overflowing waters of this and the other adjoining lakes, and to save the city of Mexico from inundation, that an immense canal has been dug, 21,653 feet in length, and carried through a mountain, and afterwards extended to the river Tula. For an account of these great works, see **MEXICO**.

ZUNA, a settlement of Quito, in the province of Quixos and Macas.

ZUNA, a large and abundant river of Quito, which rises in a lake in the province of Alausi, near that of Colaycocha; leaves the above settlement, to which it gives its name, in the province of Macas, runs east, and, united with the Vulcano, forms the Upano.

ZUNI, a settlement of New Granada, in the province of Antioquia, on the shore of the Magdalena.

ZUNIGA, POINT, on the coast of New California or New

Albion, so called by Captain Vancouver, in honour of the Spanish commandant of the settlement of St. Diego. Lat. 30. 30 $\frac{1}{2}$. N. long. 244. 16 $\frac{1}{2}$. E.

ZUNINACA, a river of the province of the Chiquitos Indians, in the eastern parts of Peru, which rises between the Capiavari and the Potaquissimi, and enters the latter.

ZVORNIK, or **ISVORNIK**, a town of European Turkey, in Bosnia. It stands on a steep rock, on the west bank of the large river Drino, and is said to have 14,000 inhabitants. It is the chief place of a large tract of country, but is very rarely visited by European travellers, being to the south of the great road from Vienna to Constantinople; 78 miles west-by-south of Belgrade.

ZUPANA, a small island in the Adriatic, between the coast of Austrian Dalmatia and the island of Melada, near Ragusa.

ZUPUTUBA, a river of South America, in the territory of Mato Grosso, which runs south, and enters the Paraguay.

ZURI, a settlement of Peru, in the province of Sicasca.

ZURICH, a canton in the north of Switzerland, having that of Thurgau to the east, and that of Aargau to the west. Its area, 950 square miles, is somewhat smaller than the average size of an English county; but its population, 183,000, is such as to rank it among the best peopled tracts of the continent of Europe. The general aspect of its territory is pleasant, though without that bold and magnificent scenery, which marks the interior and south of Switzerland. The hills, which do not rise above 3200 feet, are separated by beautiful valleys and lakes.

The density of the population of this canton is owing less to the fertility of the soil, than to the long continued enjoyment of good government, and consequent habits of industry. The effect of this is visible equally in agriculture and manufacture; in no part of Switzerland is irrigation, manuring, and the mixture of different soils, better understood. Rich pastures, and extensive orchards, meet the eye of the traveller in every direction. The cattle are in general of a good breed. Wine also is cultivated; the quality, in certain tracts of favourable exposure, is good; but in general it is thin and sharp.

The manufactures of this canton are mostly carried on by weavers in their own houses, to which are attached patches of land. The fabrics of the canton are various; chiefly cotton and light silk stuffs; also linen, woollen, and leather. Corn is imported, the produce being inadequate to the consumption.

In its mode of government, this canton was long aristocratic; but for some time back the power has been shared, at least as far as election goes, with the inhabitants at large. The whole is divided into 65 corporations, who elect the great council or legislative body of 213 members. The session of this council is very short, the executive functions being committed to 25 of its members. The revenue of the canton is about 50,000*l.*; its contingent to the military force of Switzerland, 3858. The inhabitants are almost all Calvinists. Having joined the Swiss confederacy soon after 1315, this canton was long the principal state, and had the honour of giving a president to the diet, as well as of receiving at Zurich the ambassadors of foreign powers. At present it ranks next to the canton of Berne. Its territory was the scene of important military operations in 1798 and in 1799.

ZURICH, the capital of the above canton, stands on the river Limmat, at the northern extremity of the lake of Zurich, in a narrow valley between hills. It is fortified with a wall and ditch, and is tolerably neat and clean, though most of the houses are old fashioned. The population, 11,000, are almost all Calvinists. Zurich contains few public buildings of note. The town-hall is large and well situated, but inelegant; and of the four churches, none are entitled to notice. On the other hand, the beauty of scenery is striking. The archery ground, which extends along the banks of the Limmat, to the spot where that river is joined by the Sil, a copious stream flowing from the southward, is one of the finest walks in Switzerland; and there are a number

number of beautiful promenades around the town. Zurich having in its lake and river the advantage of water communication, has long been a place of manufacture and trade. So early as the 13th century, we read of fabrics of woollens, linen, and leather, in this place. Here were also silk-works, small in extent; but of note in an age, when manufacturing industry was backward. They were soon surpassed by those of Tours and Lyons, and have been latterly replaced by cotton-works, which are carried on to a considerable extent.

Few places of the size of Zurich, have surpassed it in the cultivation of literature. It contains extensive collections of books, manuscripts, paintings, and antiques. The town library contains 40,000 volumes; that of the cathedral is also considerable. Of schools and literary establishments, great and small, there are here no less than twenty. Philosophy, divinity, and classics, are taught in the Collegium Carolinum. There is here also a military and a medical seminary, with two schools. The society of physics, economics, and natural history, has been instrumental in introducing improvements in agriculture; and among the charitable establishments, the poor house and the orphan-house are considered to be under very good management. Zurich has produced many eminent characters; 46 miles east-south-east of Bale, and 60 east-north-east of Bern. Lat. 47. 22. 15. N. long. 8. 31. 42. E.

ZURICH, a lake of Switzerland, extending in the form of a crescent, chiefly through the canton of Zurich, but partly also between those of Schweiz and St. Gall. It is divided into the Upper and Lower by the strait at Rapperschwyl, which, the breadth being little more than a quarter of a mile, is crossed by a long wooden bridge. In other places the breadth varies to the extent of nearly five miles. The length is about 30. This lake, without rivalling those of Geneva or Lucerne in awful sublimity of scenery, is still one of the finest in Europe, being surrounded by a populous and well cultivated country, and the prospects on its banks being richly varied. It abounds in fish, and affords the means of an extensive water carriage. From the thawing of the snow on the surrounding mountains, its depth increases considerably in the summer months; and as it communicates with the Rhine by the Limmat, it contributes to the annual swell of that river. The upper lake freezes in winter; but the lower, being more sheltered, is frozen only in severe seasons.

ZURITA, a town of Spain, in New Castile, on the Tagus; 43 miles west of Madrid.

ZURITE, a settlement of Peru, in the province of Cuzco.

ZURNENDORF, or ZIRNDORF, a village of Germany, in Bavarian Franconia; 5 miles west of Nuremberg. Population 600.

ZURZACH, a small town of Switzerland, in the canton of Aargau, on the Rhine; 33 miles east of Bale.

ZUSCHEN, a town of Germany, in Hesse Cassel; 16 miles south-south-west of Cassel. Population 1000.

ZUSCHEN, a town of Germany, principality of Waldeck, on a small river called the Elbe. Population 1000.

ZUSMARSHAUSEN, a town of Germany, in Bavaria; 13 miles west of Augsburg, on the Zusam, with 1000 inhabitants.

ZUTPHEN, an inland town of the Netherlands, in the province of Guelderland, on the right bank of the Issel, where it is joined by the Berckel, which fills the ditches, and flows through the town: Zutphen is fortified and strong by its situation, which is in the midst of drained fens. The air is, however, said not to be unhealthy. It is divided into the Old and New Town, and contains several public buildings; such as the principal church, a very old but stately structure; the town-hall, the college of deputies, and the S'Graven Hof, or Count's Palace, this having long been the chief place of a small country. The manufactures are very limited, consisting of cotton weaving on a small scale, the making of glue, and brewing. The inhabitants have a Latin school, and a society of natural history. In the wars with Philip II., Zutphen was besieged in 1572 by the Spaniards, who, re-

Vol. XXIV. No. 1678.

fusing the citizens a capitulation, entered the town by storm, and committed frightful disorders. It was retaken in 1591, and in this siege Sir Philip Sidney was killed; -10 miles south of Deventer. Lat. 52. 8. 26. N. long. 6. 11. 52. E.

ZUTPHEN ISLANDS, a group of small islands in the straits of Sunda. Lat. 5. 50. S. long. 105. 42. E.

ZUUREVELT, an extensive plain of good arable and pasture land in the territory of the Cape of Good Hope, reaching eastward from Zwartkops bay, and now in the possession of the Kaffres.

ZUYAS, ISLE DE, a small island on the west coast of North America, about 6 miles in circuit, and surrounded by many rocks. Lat. 54. 36. N. long. 229. 18. E.

ZUYDER-DROGTEN, a town of the Netherlands, in the province of Friesland, with 1100 inhabitants.

ZUYDER-ZEE, an inland sea or gulph of the German ocean, surrounded chiefly by the Dutch provinces of Holland, Overryssel, and Friesland. Its length from north to south is about 80 miles; its breadth varies from 15 to 30. It is said to have been in remote ages a lake, until the barrier on the north-west, separating it from the German ocean, was swallowed up by some tremendous but unrecorded inundation of the sea. This opinion is confirmed by the position of the islands Texel, Vlieland, &c., which, with intervening shoals and sand-banks, still form a kind of defence against the ocean. The trade of Amsterdam is carried on along the Zuyder-Zee, the entrance to which is at the Texel. The communication of this sea with the lake of Haarlem is by the south, forming an inlet, on the banks of which Amsterdam is built. In so level a country there are few rivers to flow into this sea: of those that do so, the largest is the Yssel. The extent of the Zuyder-Zee necessarily exposes it to great agitation in tempestuous weather; yet on proceeding from South Holland to Friesland, it is usual to sail across the southern part of it, called the Lemmer, instead of making a circuit by land.

ZWALUWE, a village of the Netherlands, in North Brabant, with 2100 inhabitants.

ZWAMERDAM, a village of the Netherlands, on the Rhine; 10 miles east by-south of Leyden. Population 1000.

ZWARTE BERG, a district in the eastern part of the territory of the Cape of Good Hope, consisting of narrow plains, which contain some fertile spots.

ZWARTE RUGGENS, a rough stony tract in the eastern part of the territory of the Cape of Good Hope.

ZWARTE-SLUYS, a village and fortress of the Netherlands, in the province of Overryssel, situated on the wide canal called the Schwarte Wasser; 10 miles north of Zwolle. Population 1400.

ZWARTE-WAAL, a village of the Netherlands, in South Holland. Population 900.

ZWARTKOPS RIVER, a small river in the eastern part of the territory of the Cape of Good Hope, which forms a bay of the same name, called sometimes Algoa bay. It gives name to one of the most fertile and beautiful districts in the colony, affording an abundant supply of grain. In the neighbourhood are extensive forests and a salt lake. The bay has five fathoms water; it abounds in black whales, and a variety of other fish.

ZWARTLAND, a considerable division of the Cape territory, about 60 miles north of Cape Town. It is considered the granary of the colony. Besides common grains, there are some swampy grounds, that produce abundance of rice.

ZWELLENDAN, a district in the settlement of the Cape of Good Hope, extending eastward from Cape Town, and bounded north by the Zwarte Berg, or Black Mountains. The length is about 380 miles, and its breadth 60, occupied by 480 families. The produce is corn, wine, and cattle, but few sheep. The population consists of 3967 Christians, and 2696 slaves and Hottentots, forming a total of 6663. The drosdy, or village, is 140 miles from Cape Town, at the foot of a chain of mountains. It contains about 30 houses, scattered over a fertile valley.

ZWENITZ, a town of Saxony; 46 miles west-south-west

of Dresden. Population 1200.—Near it is Lower Zwenitz, a populous village.

ZWENKAU, a town of Saxony, on the Elster; 5 miles south of Leipsic. Population 1200.

ZWETL, a town of Lower Austria, at the confluence of the Zwetl and the Kamp; 61 miles west-north-west of Vienna. Population 1200.

ZWEYSIMMEN, a neat village of the Swiss canton of Bern, at the confluence of the Great and Little Simme; 27 miles south of Bern.

ZWEZEN, a village of Germany, in Saxe-Weimar, on the Saale; 3 miles north of Jena.

ZWICKAU, a town of Saxony, on the Mulda; 62 miles west-south-west of Dresden. It was a free town of the empire in the 16th century. It suffered severely in the contest between Austria and Prussia. Having coal in the neighbourhood, it carries on manufactures of woollen, cotton, and hardware. Its public institutions are, a classical school, a library, and a workhouse.

ZWICKAU, a market town of Bohemia; 4 miles west of Gabel. It has manufactures of linen and yarn. Population 1700.

ZWIEFALTEN, a territory of the Suabian Alps, in the south-west of Germany, belonging formerly to a rich abbey of that name, secularised in 1803.

ZWINGENBERG, a town of the west of Germany, in Hesse Darmstadt; 11 miles south of Darmstadt. Population 1200.

ZWISEL, a town of Bavaria, on the river Regen; 50 miles east-by-south of Ratisbon. Population 1000.

ZWITTAU, or ZWITAWA, a walled town of Moravia; 37 miles west-north-west of Olmutz. It has manufactures of woollen and linen. Population 2600.

ZWOLIN, a town of Poland; 60 miles south-south-east of Warsaw. Population 1100.

ZWOLL, or ZWOLLY, a town of the Netherlands, the chief place of the province of Overysse, is on the river Aa, which is here called the Zwartewater. It is intersected by two canals, and fortified by a wall and ditch, eleven large bastions, three forts, and strong outworks. The interior is well built; it contains eight churches and a workhouse; but the only remarkable structure is the church of St. Michael. Outside of the walls are three suburbs; and there are very

fine walks on the neighbouring eminence of Agnetenberg. It has a pretty active trade, enjoying the advantage of a direct water carriage to Amsterdam, Enkhuysen, Haarlem, and some other towns. The principal manufacture is refining of sugar. It was formerly one of the Hanse towns; and the celebrated Thomas a Kempis was a monk in an Augustinian priory in this town; 48 miles east-by-north of Amsterdam. Population 12,800.

ZWONIGRAD, a small town in what is termed the military frontier of Austrian Croatia, district of Likan.

ZWONITZ, a town of Saxony; 47 miles south-west of Dresden. It has manufactures of cotton and linen. Population 1200.

ZYDACZOW, a town of Austrian Galicia, near the confluence of the rivers Stry and Dniester; 36 miles south of Lemberg.

ZYGKUR, a town of Hindostan, province of Bejapore, and district of the Concan. It is situated on the sea coast, at the bottom of Boria bay, which is two miles deep and six broad; but has only $2\frac{1}{2}$ fathoms water on the bar, although there is plenty of water inside. The town is defended by a small citadel, and is itself inclosed with a stone wall. Lat. 17. 16. N. long. 73. 23. E.

ZYNKOV, a town of European Russia, in the government of Podolia; 34 miles east-north-east of Kaminiec.

ZYPE, a town of the Netherlands, formed of the villages of North and South Zype; 18 miles west-north-west of Hoorn. Population 2300.

ZYTOMIERS, a town of European Russia, the capital of the province of Volhynia, situated on the river Teterev. It is the see of a Greek and a Catholic bishop, and has some traffic in woollen, silk, linen, cotton, wines from Hungary and Wallachia; also in the agricultural produce of the vicinity. It has some small manufactures of leather and hats; 210 miles south-by-east of Minsk. Lat. 50. 15. 37. N. long. 28. 30. 7. E. Population 5500.

ZYVILSK, a town of European Russia, in the government of Khan; 76 miles west of Kazan. Population 1300.

ZYWIEC, or SAIBUSCH, a small town of Austrian Galicia, on the river Sola; 40 miles south-west of Cracow.

ZYZEMSH, a small town of Russian Lithuania, in the government of Wilna.

FINIS.
